INDEX

Canadian Mining Journal

Vol. 28

Including the Period

March 15th, 1907 to December, 15th, 1907.

— ALSO —

The Canadian Mining Review,

January and February, 1907.

The Mines Publishing Co., Limited,
Toronto, Ontario.

INDEX

CANADIAN MINING REVIEW, JAN. AND FEB., 1907

PAGE.

Arsenical Ores, Treatment of 56
"Artesian," What is Meant by 18
Assaying Cobalt Camp Ores, by F. F. Colcord 14
A Story of Endeavor, by Nemo 13
Bell, Dr. Robert, F. R. S. 38, 45
Book Reviews 25, 62
British Columbia in 1906, by Arthur Wheeler, Jun. 49-54
Brown, R. Gilman, On the Examination of Mines 5-8
Calendars 35
Campbell, Wm., Ph.D., Experiments By, With Cobalt Ores. 57-60
Canadian Arctic 3
Canadian Mining Institute, Annual Meeting 62
Canadian Rockies, by Reginald A. Daly 15, 55
Catalogues 35, 70
Churn Drills, Prospecting With 11
Cirkel, Fritz, M.E., Address by, on Concentration 43-48
Clay and the Clay Industry in Ontario 48
Coal Notes 30, 67
Cobalt Camp Ores, Assaying 14
Cobalt Coinage, Suggestions From Geological Survey for 2
Cobalt Companies 23
Cobalt District 19
Cobalt Ores, Experiments With 57-60
Cobalt Shipments During December 16
Cobalt Shipments During January 61
Colcord, F. F., On Assaying Cobalt Camp Ores 14
Concentration, Address On, by Fritz Cirkel, M.E. 43-48
Correspondence 57
Copper, German Consumption of 22
Copper Statistics 19
Daly, Reginald A., On the Canadian Rockies 15, 55
Editorial Notes 1, 37
Examination of Mines, by R. Gilman Brown, E.M. 5-8
Experiments With Cobalt Ores, by Henry M. Howe, LL.D., Wm. Campbell, Ph.D., and Cyril W. Knight, B.Sc. .. 57-60
Geological A B C 4
Geological Survey 3
Geological Survey, Summary Report of for 1906 38

PAGE

German Consumption of Copper 22
Hastings (B.C.) Exploration Syndicate, Ltd. 20
Hastings (Ont.) Mining Association 60
Horton, F. W., On Production of Platinum 12
Howe, Henry M., LL.D., Experiments by, With Cobalt Ores. 57-60
Industrial Notes 31, 67
Is Matter Electricity? 17
Knight, Cyril W., B.Sc., Experiments by, With Cobalt Ores. 57-60
Lee, Chester F., M.E., On the Treatment of Arsenical Ores... 56
Metals 17
Metric System 3
Mines, Examination of 5-8
Mining Association, A New 61
Mining Incorporation 32, 69
Mining Industry, Canadian, in 1906 41
Mining Notes 26, 64
Mining and Industrial Share Market 22, 30, 67
Occurrence of Platinum 8-11
Our Chief Geologist 38
Our Mining Industry in 1906 41
Personals 26, 63
Pheby, F. S., On Prospecting With Churn Drills 11
Platinum, Occurrence of 8-11
Platinum, Production of 12
Production of Platinum, by F. W. Horton 12
Prospecting With Churn Drills, by F. S. Pheby 11
Quebec's Mining Area 61
Southern Yukon, The 40
Suggestions From Geological Survey for a Cobalt Coinage.. 2
Summary Report of Geological Survey for 1906 38
Tinstone in Canada 39
Treatment of Arsenical Ores, By Chester F. Lee, M. E..... 56
Trethewey Mine 17
Way of the North, The 17
What Is Meant by "Artesian" 18
Wheeler, Arthur, Jun., On British Columbia in 1906..... 49-54
Yukon, The Southern 40

INDEX

CANADIAN MINING JOURNAL; VOL. 28

PAGE.

Acting Deputy Minister of Mines of Canada 582
Adams, Dr. Frank D., On Undeveloped Mineral Resources of Canada 13
Alberta Coal Commission and British Eight-hour Bill..... 354
Alberta, Coal Mining in, in 1906 401
Alberta, Coals and Coal Fields of 81
Alberta Mining Conditions 322
Alberta, Special Correspondence 63, 380, 474, 507, 537, 569
Algoma, Special Corespondence 28, 124, 155, 349, 414
Algoma Steel Co. 22
Allan Shafts, Sinking 99-104
American Institute of Mining Engineers 130, 163, 183, 304
Visit of, to Cobalt, etc. 324
American Institute of Mining Engineers, by R. W. Raymond 260-263
Analysis of Silicate and Carbonate Rocks, by W. F. Hillebrand 141
Anemia, Miner's 322, 325-330, 362, 393
Ankylostomiasis, "Miner's Anemia," by F. W. Gray 325-330, 362, 393
Another Suggestion 289
Antimony, Production of, in 1906 506
Argentiferous Cobalt-Nickel Arsenides, Roasting of..... 54
Arsenic, Domestic Production of 596
Asbestos 131-135
Asbestos, Crystallization of, by W. J. Woolsey 212
Asbestos, Discoveries in Foreign Countries, by Fritz Cirkel, M. E. 54, 122
Asbestos Industry, The Canadian, by Fritz Cirkel, M.E.. 135-138
Assayers 162
Austin, L. S., On Smelter Smoke 588
Austrian Iron Industry During Last 25 Years, by W. Kestranek 435-439
Bauerman, H., On the Erzberg of Eisenerz 460

Company Reports 30
Comparison of University and Industrial Methods and Discipline, by Fred W. Taylor 73
Composition of Glass Sands and Moulding Sands..... 488
Concentration of Gold in the Klondike, by J. B. Tyrrell.... 403
Concerning Ottawa 34
Coniagas Mine and Concentrator 276
Consolidated Mining and Smelting Co. 98, 547, 578
Smelting Works of 421-425
Consolidated Mining and Smelting Co., by Geo. A. Ohren... 117
Copper 129
Copper Deposit, Marble Bay 200
Copper Deposits of Yerrington, Nev., Genesis of 365
Copper Ore and Matte, McMurtry-Rogers Process of Desulphurizing 149-152, 243
Copper Ores, Some New Points in the Geology of 274
Copper Smelter, Pictou 193
Corliss Air Compressor, a Straight Line 494
Corkill, E. T., on Mica in Ontario 196-200
Correspondence .. 25, 91, 123, 184, 216, 281, 342, 375, 411, ...442, 506, 534, 599
Correspondence Instruction, Value of 579
Corundum at Craigmont, by H. F. T. Haultain 291-296
Coste, Eugene, M.E., On the New Tilbury and Romney Oil Fields of Kent Co., Ont. 265-268
Craigmont, Corundum at..... 291-296
Criticism 98
Cumberland Coal and Railway Co. 484
Dalhousie University, Mining Laboratory of 176-182
Deloro Mining and Reduction Co. 517-522
Denison Colliery, Coleman, Alta. 18-20
Development 97
Development of Ore Shoot in Nova Scotia, by E. Percy Browne 457
Diamond Trust 529
Diamonds in Arkansas, by Alex. Gray 550
Difference of Three Ciphers, by Alex. Gray 487
Discoverer of Klondike 258
Discovery of the Klondike, by Major Henry J. Woodside.... 405
Dissipation of Energy 226
Dividends 64, 127, 256, 288, 320, 384, 416, 448, 512
Divining Rod, Use of 499
Dominion Coal Co. 353, 419, 427
Dominion Iron and Steel Company 353, 419, 427
Douglas, Dr. James, on Secrecy in the Arts.....330-333, 355-358
Dowling, D. B., On Coals and Coal Fields of Alberta, Saskatchewan and Manitoba 81
Drummond, Dr. W. H. 65, 73
Drummond, John James 7
Dublin International Exhibition, Canada's Mineral Exhibit at 249
East and West 66
Ecker, Edwin C., On Iron Ores, Pig Iron and Steel.....557-560
Economic Distribution of Electric Power From Blast Furnace, by B. H. Thwaite 591
Editorial Notes .. 1, 35, 67, 98, 131, 163, 195, 227, 259, 323, ...368, 419, 450, 515, 548, 581
Education in Nova Scotia 34

25th YEAR OF PUBLICATION

The Canadian Mining Review

Established 1882

THE OLDEST AND ONLY OFFICIAL MINING JOURNAL PUBLISHED IN CANADA.

Published by The Review Publishing Co., Ltd. PUBLISHED MONTHLY. 171 St. James St., MONTREAL.

VOL. XXVIII—No. 1. MONTREAL, JANUARY, 1907. Two volumes a year. Jan.-June; July-Dec.

THE CANADIAN MINING REVIEW.

Published by THE REVIEW PUBLISHING COMPANY, Limited, P.O. Box 2187, Montreal, Canada.
Subscription, payable in advance, $3.00 per year, including postage.
The REVIEW'S columns are always open for the discussion of questions cognate to the mining industry.
Advertising rates on application.

EDITOR:
Charles A. Bramble.

SPECIAL CONTRIBUTORS.

NOVA SCOTIA:
Charles Fergie, M.E., Manager Dominion Coal Co., Ltd.
Graham Fraser, Sydney Mines, Cape Breton.
G. H. Duggan, Vice-President Dominion Coal Co., Glace Bay, C.B.

QUEBEC:
J. Obalski, Supt. of Mines, Province of Quebec.
Prof. Frank D. Adams, Professor of Geology, McGill University.
John E. Hardman, M.E., Montreal.

ONTARIO:
A. P. Low, B.Sc., R.G.S., Director, Geological Survey of Canada.
Thos. W. Gibson, Deputy-Minister of Mines, Ontario.
Dr. Alfred E. Barlow, Geological Survey of Canada.
W. G. Miller, Provincial Geologist, Ontario.
H. W. Hixon, Victoria Mines, Sudbury.

BRITISH COLUMBIA:

We have no reasons to advance for the drop of a certain Cobalt stock from over $30.00 to under $11.00. We rather pride ourselves upon such peculiarity; because we think that we are, perhaps, almost singular in this respect. We do not know why the Guggenheims threw up their option on 40,000 shares—thereby depressing the stock some 20 points—because they have not told us. Others claim inside knowledge, but as there are as many versions as there are informants, we feel that a certain amount of caution, respecting each and all these statements, is justified. One thing, we do know, however, which is that Cobalt camp contains a great deal of silver; that about fifty of the mines are shipping; and, that, notwithstanding the horrible fluctuations of the New York curb, and the hysterical excitement of the small investors in Toronto, the miners of Northern Ontario are plugging away, and gradually building up a camp that will assist in spreading Canada's fame to the uttermost parts of the earth.

The stock of some of the best mines is not on the market; while the stock of very many mines, that are not, strictly speaking, mines, is being dealt in gleefully and freely. We are of the opinion the situation was well summed up by a Toronto scribe when he wrote: "Many of the Cobalt mines are lying idle and their owners are lying furiously."

We anticipate that there will be quite a development of the Larder Lake gold field next summer. In fact, it would not be a surprise, if there should be as much interest displayed in Larder Lake a year or two hence as has been the case with Cobalt during the past six months. Moreover, we feel a fatherly interest in Larder Lake, because the Editor of this Review had the honor of naming it, and also of making the first reconnaisance survey of the lake and adjacent waterways.

It happened in this wise: During the summer of 1901, the writer found himself on the White, or Blanche, River, in company with John Wabie, a North Timiskaming Indian, and his son. When we reached the point where Tomstown is now situated,

honest old John, an Indian of great respectability and sterling merit, pointed out that, owing to the unusual lowness of the water, our projected journey to Matachewan would inevitably be a hard one; instead of poling several miles up a small creek, we should have to carry our belongings about 15 miles from theWhite River waters to those of the Montreal River. This was rather more than we had bargained for, and, as there was no particular reason why we should go to Matachewan in preference to any other place, we said to him, "John, where can we go, if I give up my trip to the Montreal River?" We had about three weeks to spare.

"You go to Tegousiewabie," replied John; "find him big lake, lots fish; just like Timagami."

Now, this was just what I wanted, so I took out my map, and, behold, the place where Tegousiewabie was reported to be, was blank! Here was a chance for exploration—fine scenery, good fishing, and goodness knows what beside—all in one trip. So, I gave the word, and the bow of the canoe was turned up the North-East branch of the White River.

"What is the meaning of Tegousiewabie, John?"

"Place where we put our grub," explained he. "When Indian run short grub, he says 'let's go Tegousiewabie, sure find him there." Which, being translated into English, is evidently Larder; because that is the place where families of distinction who have any food, especially game, to preserve, keep it.

After putting in several days on the lake, though, alas, without finding any gold mines, perhaps, because we were not looking for them, being much occupied with latitude, bearings and distances, we returned to civilization by way of the North branch. The Geographic Board accepted courteously our suggestion as to the name of the Lake, after Dr. Robert Bell had satisfied himself that the translation of the Indian name was correct, and our sketch map was also incorporated in later publications issued by the Department of the Interior.

SUGGESTIONS FROM THE GEOLOGICAL SURVEY FOR A COBALT COINAGE.

The discovery of Cobalt ore in large quantities in Northern Ontario and the limited market for that metal, have had a disastrous effect upon its price, which has fallen from three dollars to thirty-seven cents a pound.

At the present time cobalt and its compounds are almost wholly used for pigments, chiefly for coloring glass, or the glaze for pottery, beautiful blue, green, yellow, and bronze colors, suitable for these purposes being obtained from a cobalt base. The metal is said to be very effective for electrical storage batteries, while as a plating material it is much superior to nickel, the coating being harder, brighter and more tenacious. Experiments conducted with a view to the use of cobalt in a manner similar to nickel as an alloy of iron have not proved successful up to the present, notwithstanding that cobalt from its hardness and high magnetic properties would naturally be expected to give superior results.

The market for cobalt colors is a limited one, and in competition with cheaper artificial colors it is not rapidly increasing. The improvements in storage batteries will probably cause an increased demand for the metal while the cheapening of cobalt consequent to the new discoveries may greatly increase its use as a superior plating material.

The present small silver coinage of Canada, especially the five-cent pieces, is inconvenient and is easily lost; in the place of these it is proposed to substitute a larger coin of cobalt approximating in size the nickel five-cent pieces of the United States, while a smaller coin might replace the present bronze cents. Owing to its hardness; maleability and lack of tarnish cobalt is an ideal metal for these coins of low value. It would furnish a unique coinage and would assist greatly in absorbing the surplus of cobalt now being mined. The issue of these coins would secure a considerable profit to the Government, and their introduction would fittingly mark the establishment of the new Canadian mint at Ottawa.

THE GEOLOGICAL SURVEY.

When an up-to-date Geology of Canada comes to be written, one of the principal features of the work will be, we hope, a series of chapters showing the practical good that has resulted from the explorations and examinations of the Geological Survey. There is hardly a mineral industry in Canada that has not directly benefited from the work of the Survey, and this is the more to be appreciated when we remember that the officers of that institution are speaking, as it were, for the Government, and are naturally constrained to be more careful than if they were reporting independently In the former case, the Survey is responsible for what they write, in the latter they alone are responsible.

It is many years since the Survey pointed out the metalliferous character of the Huronian rocks, and the opinions then stated were so soon acknowledged by all mining men and prospectors to be accurate, that any maps published by the department depicting an Huronian area, are always eagerly sought after.

When we review the nickel, copper and gold deposits of the vicinity of Sudbury and Sault Ste. Marie, and especially the silver and cobalt veins of the Timiskaming region, the economic and metalliferous character of the rocks of the Huronian system becomes even more apparent. This fact was recognized and the importance of the geological conditions insisted on by Sir William Logan, in reports of the Survey made nearly fifty

years ago, and it is gratifying to observe that the practical miner has begun to appreciate the value of the large amount of geological work carried out in the districts of Nipissing and Thunder Bay,—work which, a few years ago, might have appeared difficult in the light of any economic results up to that time achieved.

More than ten years ago the late George M. Dawson, then Director of the Geological Survey, made this very definite prophecy—a prophecy that, as we all know, has been so amply fulfilled:—"There can be very little doubt that every square mile of the Huronian formation of Canada will sooner or later become an object of interest to the prospector, and that industries of considerable importance may yet be planted upon this formation far to the north, or for other reasons at present regarded as barren and useless. . . . . Upon Lake Timiskaming is one of the typical Huronian areas."

THE METRIC SYSTEM.

The Metric System is steadily gaining support, and the Dominion Government showed wisdom in issuing a pamphlet descriptive of it. In Great Britain, one of the largest manufacturing firms—Kynoch, of Birmingham—has done away with the complicated English standards, and is adopting in its entirety the French metric system of weights and measures, of which the meter is the unit. In their calculations of costs they are adopting the pound sterling as the unit and are working down to four places of decimals. Tables have been prepared, by which every employee will be able to convert the expressions of English currency into a French or any other unit at a moment's notice.

Lord Kelvin, whose dictum should certainly carry weight, has expressed himself as thoroughly won over by the metric system. In the course of a recent speech, he said: "I believe engineers of every branch will find the metric system exceedingly satisfactory and convenient, when once they begin using it. For measures of length, large or small, the French system is vastly more convenient, in every respect, than our unfortunate British inches, feet, yards, rods, poles, perches (the perch five-and-a-half yards), chains, furlongs and miles. In a mechanical workshop, whether for large machines or small scientific instruments, the smallest named unit, the inch, is much less convenient than the centimeter with its named sub-division, the millimeter.

"The British workman will be much happier at his work with a folding fifty-centimeter rule, graduated to millimeters, than with the folding two foot rule, graduated to eighths, sixteenths or thirty-seconds of an inch. For the smallest division of a workman's scale, the millimeter is particularly easy to read and use, and is thoroughly convenient for the smallest named unit of length.

"I believe if a fifty-centimeter folding rule was presented to each workman in a workshop of 100 or 1,000 highly skilled workmen, the employer would be more than reimbursed in a fortnight by the increase and the improved quality of the produce of his men. Anyone who knows the troublesome character of handwork prescribed in such terms as 1 in. and 3-8 in. and 7-11 in. and 17-32 in. will see that there will be a considerable saving of time when the workman has his job stated to him in so much more easily understood terms, as 59 1-2 mm. Work of the highest accuracy in an engineering workshop is, of course, ultimately controlled by accurately standardised gauges, and for these the designation, whether in inches or centimeters, is of comparatively little importance. But it is of considerable importance to notice that the British engineer leaves thirty-seconds and jumps down to "mils." (thousandths of an inch) in specifying gauges, or in actual work finer than the thirty-second of an inch. Not one of the accurately standardised gauges at present in use in engineering workshops will need to be changed when the metric system is adopted.

"A very large proportion of the work in a drawing office of a civil or mechanical engineer, in this country and in America, is entailed by the monstrously and absurdly inconvenient, and unsystematic sets of measures of length, area, bulk, and weight imposed by bondage to the present British measures. I could give you many examples of the waste of good work under which we now suffer."

It appears to us that most of the arguments against the metric system are extremely weak. They certainly are not more forcible than were those of the old stage-coach man when railways were introduced, and are akin to those of the late Mr. Greener, who in 1858, wrote an elaborate work mainly to prove that the breech-loading system as applied to firearms, could not successfully compete with the time-honored muzzle loader.

We feel that mining men, especially, will find a great benefit through the universal introduction of the metric system. A great deal of the best technical literature comes from the pens of foreign engineers, and all measurements are given according to the metric system; at present, these are not readily translated into their English equivalents by the average mining man.

THE CANADIAN ARCTIC.

A more fascinating subject than Arctic exploration does not exist. There is a fascination about the silent, icy wastes of the North, which once felt is never forgotten; even the stay-at-home traveller, the man who does his explorations in fancy, in a comfortable arm-chair, becomes absorbed by the snowdrifts, and ice fighting, and long, dark months, the sledge travelling, and all the other novel features that go to make up such stories of adventure. We

have seen the sun at midnight and the moon at midday, and have a fair acquaintance with most things that have been written upon Arctic exploration, but, we think, especially for Canadians, one of the most interesting, if not the most interesting account ever published, is the report of the Dominion Government expedition to Hudson's Bay in the Arctic Islands by the D.G.S. Neptune during 1903 and 1904, of which Mr. A. P. Low, the present head of the Geological Survey, was in charge. This has just been issued by the Government Printer, at Ottawa.

Its value is, largely, owing to the leader of the expedition being a geologist whose scientific attainments are beyond question, who had made a reputation during years of plucky, persevering work in Labrador, and whose previous training rendered him peculiarly fitted to be the leader of such a party. Instead of mere guesses at the geology of the places visited, we find concise, clear statements, which enable us to understand a good deal of the geological sequence of the formations adjoining Hudson's Bay and of the various Arctic Islands north of that sheet of water.

It appears, that the chances of finding economic minerals under conditions that will permit of their exploitation are good. The great Huronian rocks that have been found to stretch from Lake Superior to Mistissini are now known to be duplicated through the north. Copper, iron, mica, gold, silver, graphite, molybdenite, and coal have been found; of these copper, iron and mica seem to be abundant. It is, probable, one of the largest copper-producing regions in Canada will eventually be that lying between Chesterfield Inlet and the mouth of the Mackenzie along the shores of the Arctic sea. This will not be a very difficult country to work in, as vessels can penetrate to Chesterfield Inlet and Fullerton during three months out of the twelve, and railway building across the barren lands would be a simple matter.

Mr. Low's description of the Eskimo is most valuable, and we do not remember to have read anything so thorough by other Arctic travellers. Moreover, he takes a broad, comprehensive view of the situation, such as one would expect from a man of the world, with a scientific education; being liberal enough to realize that social customs and natural habits must depend largely upon environment.

He also throws out some hints that the Government would be wise to take note of. In order to protect the natives living in the more distant regions, it will be advisable, undoubtedly, to prohibit any encroachment upon their hunting-ground by Eskimo, who, through contact with whites, have acquired fire-arms.

The meteorological observations taken on board the Neptune, during 1903 and 1904, by Messrs. C. F. King, J. E. Borden, and G. B. Caldwell, show that the climate, as far as mere cold goes, compares favorably with many parts of the Dominion that are inhabited by the Anglo-Saxon race. The coldest day experienced was the 25th February, 1904, when the temperature was —40.7, the minimum being —46 and the maximum being —38. As a rule, however, even in the depth of winter the thermometer was frequently hovering about the zero point. Of course the harbour ice attained an extraordinary thickness, reaching 75 inches by the 22nd day of May, after which it began to melt. The most objectionable points about the Arctic climate are the long winter nights, and the dampness and fog prevalent during a great part of the summer.

If we may be permitted a criticism of a book that is almost flawless, we should say that the natural history notes are less complete than might have been expected. One cannot accept the list of 44 birds as a comprehensive one. If these were all the species the expedition met with, it was, certainly, peculiarly unfortunate. Land animals are hardly touched upon. On the other hand, the geological collection, made by the Commander himself, is particularly valuable, and shows the importance of having a recognized authority in charge of each Department of such an expedition. We believe the Dominion Government would act wisely in building a vessel for Arctic service and in keeping it constantly in commission; two years' cruises with competent commanders and staffs, would enable us to know in a few years the actual resources of the Northern Archipelago, and of the Arctic shores of the Dominion.

A GEOLOGICAL A. B. C.*

EXAMINATION OF MINES.*

By R. Gilman Brown, E.M.,

I feel myself fortunate in enjoying this opportunity of elaborating before such a representative body some of the fundamentals of mine examination; the more so because they have not always been fundamentals, because it has been largely due to the dispassionate business sense of business men that fundamentals they now are, and because, more than anything else, to the observance of such fundamentals by the investor and engineer alike, is the view of mining as a business and not a speculation to be attributed.

But in these matters the business man is the mainspring. Where there is a demand there will be a product to satisfy it, and the modern mining report is made to answer a simple business question: "What will be the profit?" Stated at length, my subject is: "The Examination of Mines Preliminary to Purchase; To-day as Compared with Twenty-five Years Ago."

It is naturally "to-day" that has the most practical interest for us, but all advance is relative, and if any of you will take the pains to "dig up" some of the reports upon which mines were bought in the early '80s and compare them with modern ones, the advance towards definiteness will be the most impressive point of difference. Then, more stress was laid upon generalities, more weight given to empirical conditions; ore reserves and net values were less considered; a telegram from the man in the field stating that the mine was worth it, would be sufficient to make the capitalist pay out his thousands, by hundreds. Engineers, the best of them, cheerfully advised their clients to take all sorts of chances on persistency in depth on the various uncertainties attendant upon underground work.

It is not that people are now less ready "to take chances," but that it has gradually come to be the belief of engineer and capitalist alike that the chances should be recognized as taken; that if the buyer wishes to speculate for big returns, he should have the opportunity, so long as he is posted on what he is doing. Along with this belief has come the particular recognition of the general law, applicable not alone to mining, that those who would participate in a "dead sure thing" must be satisfied with a small percentum of returns; that those who wish to "plunge," stand to lose all or to gain fabulously, with the whole gamut of intervening possibilities.

I would here pay my tribute to the pioneer engineers with a text-book assistance that was meagre as compared with to-day; with little besides their individual experience and good sense, they were wonderfully successful in their prognostications. Their work is to be no more disparaged than should an engineer now venture to ignore the use of the extensive kit of tools, the accumulated experience of the past quarter of a century has provided for him.

So far as this paper is concerned, the last phase can be dismissed in a few words. It is to-day by no means an infrequent occurrence for business men to "take flyers" in undeveloped mining claims; rich and poor, those who can afford to lose the money and those who can not, seem equally addicted to this sort of thing, but I must emphasize, and all must agree that this is not investment in mines; it is a venture, pure and simple, a speculation without reserve (and without reserves), and though the competent engineer with his wide knowledge of costs, of various regions and of what goes to make up a mine, can, undoubtedly, lessen the percentage of loss in such transactions, it is not to-day his most useful sphere. The most he can do in such a case is to tell his client whether he will have a run for his money, whether the possibilities are such as to constitute a good mining chance. The pity of it is that the lay capitalist does not recognize, as a rule, the essential difference between this game and the sober business of legitimate mining investment.

This is particularly bad because the business man, turning for the first time to mines, is more likely to take up with some such long shot of this

---

* A paper read at the Eighth Annual Session of the American Mining Congress.

category than with the other. He pays small attention to the details of the matter—not a fraction of what he would if the same sum were to be put into a warehouse scheme, say, outside, of his regular line—and if the time comes when he must either abandon his "investment" or put up more funds, whichever course he follows, he feels he has been bitten, and in the future views the word "mining" askance. This works another way as well, for he has come to look on mining as outside of business laws, and should he get into a mine that is really an investment, he is still apt to view it loosely as such, and not to inquire too closely into the business details of the management.

Doubly important then is it that the lines be sharply drawn between the two classes of mining, and that the layman in mining matters does not settle down to his layness as the end of the matter. The investigation of one class may take an engineer a week; of the other, months. In the case of the prospect, the report is largely a brief statement of possibilities, with the pros and cons clearly given. In the case of the mine, it is an exhaustive study, an exposition of facts and conditions, with carefully drawn conclusions. It is this latter that particularly concerns us.

The fundamentals of the modern mining report—foal of engineering out of geology; broken by that most exacting of trainers, business sense—demand that the examination should have been conducted on certain lines; that certain matters should have been investigated; that certain tests should have been made; and when a report comes to hand not matching, point by point, with this formula, with some of these fundamentals slighted or missing, the investor will do well to refer it to independent engineering scrutiny, or, failing this, to send it back by the first mail.

These fundamentals are by no means esoteric; in their recital they are not formidable, and to the uninitiated give small evidence of the weeks and months of laborious investigation they have cost the engineer.

They are: The assay plan, showing the tonnage and assay value of the ore reserves; the table of costs; the summary of profits; the chances for the future; the question of title, and, if in the United States, the safety against litigation, arising from our deleterious law of the apex. It will not be without interest to see roughly how these are determined.

The assay plan is the multum in parvo of the report; to its production has gone more plodding work than to all the rest of the examination. It is an accurate, large scale map showing ore bodies with their average values. Average values can only be truly determined by thorough and painstaking sampling, going over the workings yard by yard and laboriously breaking down rock that will represent the whole mass at each point. It is a tedious job at best, but can not safely be slighted. It is frequently claimed that milling tests are better; that tests of the ore as it comes out from the drifts and raises of development work are better, that this, that or the other short cut to the result is better, as well as easier. All of us who have sweated in this sampling of mines will admit that there are many things easier, but the general consensus of those mining engineers who have been conspicuously successful in their prognostications is that there is no short cut that does not involve long and perilous leaps. From this it results that if the property is not in shape to be sampled, it is not in shape to be bought as a mine and it is only a prospect.

Strictly, I should close the paragraph right here, but I am so anxious to carry conviction on this point that I venture a word more. It is plausible to claim that from a tunnel driven on a vein of ore must come ore that will give a fair average of that vein; and this would be the case were the tunnel of uniform height from end to end, but it happens to be almost the rule that were the ore has been more valuable the tunnel has been run higher in accordance with the law of human conduct that puts the best foot forward, with the result that a certain proportion more of the better ore has been included in that coming from the tunnel. What becomes, then, of our average value?

Each of the assay values must be tabled with the width of ore it represents, and for each block in the mine averaged. Here no mere arithmetical average will do, summing the results and dividing by the number of them, for that would give the same weight to a six-inch high-grade streak and the six-foot low grade. The true average must be gotten: For each sample, width is multiplied by value, these products are added and divided by the sum of the widths. This is kindergarten teaching so far as engineers are concerned, but hardly so, I fear, as regards the investor, to whom particularly I am speaking.

The determination of the tonnage, represented by the ore blocked out, is largely simple surveying work, but the engineer must use great caution in what he includes as ore reserves. Fortunately, the old, easy term of "ore in sight" is passing into disuse, thanks to the influence of a prominent mining society, and the modern engineer is expected to designate closely just what degree of certainty he has about the tonnage of each block. It is obvious that a tunnel driven one thousand feet in ores does not in rigid interpretation block out any ore, though an engineer is frequently justified in assuming certain distances above and below as "probable" or "reasonably to be expected;" but each such estimate is in its own category. The ore blocked out, as commonly understood, is ore with three or four sides showing in the workings. All of these data are collated on

the assay plan; on the map showing the tunnels and workings to scale, are plotted in proper position, each sample with its width; the value for each block is given and the tons and average width, the one determined by multiplying the average width by the area of the block measured on the vein and dividing by the cubic feet going to make up a ton of ore in place; the other being the true average of the assays for that block. I venture to insist here, with an insistence that may to some savor of dogmatism, that an assay plan should be prepared in every case where a mine is being bought for its ore; nothing better than this shows whether the examination has been slighted, nothing is more readily comprehensible to the lay purchaser.

The costs of extraction in the case of an operating mine might seem to be a mere determination of results that a competent bookkeeper could prepare and to a certain extent this is so. But more often than not, the value of a particular mine hinges upon the introduction of improvements, increasing the capacity of the plant, and on economies to be gained in the present scale of operation. Light can be shed on these only by a proper segregation of the items of cost.

To a varying degree, each mine is a lonely entity, with strong individual characteristics at times amounting to eccentricities. This is true even of mines in a single district, even in a district of the South African Rand, and thus it results that the engineer can not safely say costs will be so and so because these have been attained elsewhere.

In the case of an operating mine the engineer segregates the items over an extended period into reasonably narrow categories. A comparison of each of these with the work of other mines may give him a hint as to what items are normal and what are not, but for definite figures he goes out through the works and mine, noting the duties of the men and their efficiency, both eyes open, his mind bent to a big interrogation point. In the light of this investigation, he makes fresh calculations of what ought to be the costs on the present scale of working. Then he proceeds to a fresh segregation that will separate from the whole mass the fixed general expenditures, those that do not depend upon the yearly tonnage. As these will be practically the same in total, they will obviously be less per ton with a larger tonnage, so that, when the ore reserves are big enough, increasing the scope of operations, affords a most profitable field for the investment of capital. The importance of this warrants reiteration in a different form: general fixed costs are constant in total, and inversely proportional to tonnage in per ton figures. Other costs are directly proportional to tonnage in total and constant in per ton figures.

This estimate tests most severely the ability and judgment of the engineer, and everything depends upon its correctness. It can not be ignored and yet in the hands of the mere office man becomes academic and a snare. An error here is quite as serious as in the sampling, and, as examinations are now-a-days conducted, it is easier to "salt" the cost sheets than the mine—and fully as effective.

The profit in the ore reserves of various kinds is a plain calculation from these premises, and, notwithstanding the serious drawback that the sampling can physically only represent the real values of the boundaries of the blocks of ore, has been found, except in unusual cases, to closely approximate the facts.

I have reserved until now speaking of the interval at which samples are taken because the importance of this factor is now more clearly to be seen. The experience of the engineer and his preliminary inspection of the mine and assay books has told him what is likely to be the proper interval for his sampling. If the ore is high grade and spotted, he naturally takes a closer spacing, and two-foot intervals are by no means unknown. Such close spacing is at times called for by even low grade mines if the values are very irregular. The engineer recognizes that in a multitude of samples lies safety and, very frequently, as the work progresses, finds that the interval selected is too wide and has to go back over his work and interpolate other samples. But he considers it an absolute essential that the distance apart shall be uniform for each individual block, it being obvious that if he has twenty high grade samples from a 100-foot tunnel and ten low grades ones from another 100-foot length, by even correct averaging, the result for the 200 feet will be too high. At times it happens that the high grade ore will be more erratic in its sampling than the low and that it would be a waste of time and expense to sample the low grade at as close an interval as the high. In these cases he is frequently justified in estimating each separately and then combining the two in the proportion of length that each represents. There is more than one way of doing this and it will hardly be interesting to explain fully such merely technical things.

It is rarely, however, that a mine is sold for merely the profits in the reserves; certain assumptions are made about continuance of ore, and it is the difficult task of the engineer to decide what assumptions are justified, by the conditions. Indeed, it may be pertinently asked why anyone should sell at all for only as much as he has already assured, and, on the other hand, why another should care to buy if he only expects to get back what he pays out. The answer to this question is outside the scope of this paper, but it can be briefly said that in the answer is involved the essential difference between the buyer and seller in any transaction, as well as certain peculiarities inherent in mining transactions alone. The vendor's knowledge of his mine is more sketchy than that of the buyer after his examination

and while he is apt to be more hopeful of the prospects, this may be more than offset by imperfect realization of the possibilities of improvement. Aside from this, and in the case of the professional promotor, he is apt to figure on a price that will give him a good profit on his outlay and trouble. Logically and practically, then, it is the prospect that is bought and we here come into close contact with the work of the engineers of the '80s and with that of the man who sets out to value a prospect.

A moment's consideration, however, shows that there are certain facts that here help out. The history of the mine affords certain clews to the future. The workings give vast advantages for the study of the particular geology. Moreover, almost a new science has been elaborated in recent years, that of economic geology. The servants of this have been enthusiastic and earnest and are opening out avenues of discovery that make our resources of twenty-five years ago appear, by comparison, sophomoric. This branch of geology is, however, only new so far as its general use is now common to the engineer. The painstaking studies of a generation of students go far to make it now possible, but what was being done in the '80s was the devoted work of a few; that of the present is being done by an army of investigators. By this the examining engineer now profits; indeed, he is very frequently assisted by a geological specialist in his investigations.

All the data of the assay plan are studied for the light to be thrown on the future as to change in dimensions of the ore bodies and of tenor in their contents and to these questions of persistence, they give prompt, if empirical, answers. The geological study of the vein, the existence of dikes, of cross-veins, of changes in wall rock, all of these have a bearing on the future. Then there is the pertinent inquiry as to the extent the deposit owes its value to surface conditions, which are now recognized as often reaching to profound depths. It is practically impossible to do more here than state the prime factors in the case which must all be combined into a trustworthy opinion. This is a severe test of judgment. No mine examination is to be lightly approached but when the engineer reaches this consummation of all his work, the responsibilities of his position have, in truth, come home to him. He is now to form his conclusions, the answer to the question with which he began: "What will be the profit?" He has certain definite facts arrived at by painstaking investigation. He has a number of facts of less definite demonstration and he has a swarm of the small impressions that have buzzed around him during the examination. He must give due weight to each and combine the whole into a decision with logical sequence of conclusion to premise, so that no one can say "non sequitur." Just how this is done constitutes the personal factor, and who shall declare its course of operation? It is far removed from mere guess work, it is the special faculty of the well balanced mind; with no direct relation to personal predilection, we know it as but that imponderable quality of "judgment."

But this talk about judgment must not blind us to the clear separation of fact from future.

With all his innate habits of mind, the engineer strives to give to his report the one, distinct from the other; and this is made clear no less in the use of his data than in the deduction of his conclusions. He virtually says: "These are the facts as nearly as they can be determined; there are the uncertainties; the true weight of the uncertainties is thus and so, the chances are such and such. The problem is before you, make your decisions, what will you do? With this the scope of the engineer is reached, his work is done; he has investigated, and found the facts." He has studied, and evolved the probabilities; he has stated the one and the other with logical succinctness, and it is now up to the other man, as it always must be up to the man who provides the funds. When all is said and done, his decision is final.

I started out with the aim of showing what were the recognized fundamentals of the mining report of to-day, devised by experience to lessen the hazards of purchase; I have tried to show how guess work has been eliminated, how certainty has been sought, whenever attainable; what the limits of definite information are and what degree of reliance is placed on the purely personal factor of judgment. I have explained how the mining engineer, in his appraisement, makes the practice of separating the positive from the tentative factors, of presenting the one categorically, imperatively, as becomes the expression of ascertained physical facts, the other modestly, as things probable but concerning which the best judgment may be at fault.

If this serves to give the investor a better idea of what to look for in a mining report, I shall be pleased; if it aids him to place due value on the work of the engineer, I shall be gratified. If it leads some few to appreciate the essential qualities of mining as business without inordinate risk, I shall be more than satisfied.

THE OCCURRENCE OF PLATINUM.*

Platinum is largely employed in chemical industries for the construction of vessels in which corrosive liquids such as strong acids are to be dealt with. The metal is sparsely distributed, and in recent years, owing to the great extension in industrial chemistry which has taken place, the demand for platinum has exceeded the supply and its price is rapidly becoming almost prohibitive. In addition to its use in chemical industries the metal is also employed in electrical work and to a small extent in

* From the Bulletin of the Imperial Institute.

photography. It has also been used in jewellery. In view of the increasing demand for the metal special interest attaches to its occurrence in hitherto unexploited situations.

Platinum Minerals.

The mineral known as "native platinum" consists of an alloy of platinum, iridium, palladium, and sometimes osmium, gold, iron and copper. The usual forms of the mineral are nuggets, scales or irregular grains. In color it varies from silvery-white to dark-gray and it has a metallic lustre. The hardness varies from 4 to 6; the fracture is hackly, cleavage none. It is malleable, ductile and sectile, and has a specific gravity of 14 to 18.

The composition of platinum nuggets from various localities is shown in the following table: —

Source.	Russia.	British Columbia.	New South Wales.
Platinum	76.40	72.07	75.90
Iridium	4.30	1.14	1.30
Rhodium	0.30	2.57	1.30
Palladium	1.40	0.19	trace.
Osmium	.....	.....	.....
Ruthemum	.....	.....	.....
Iridosmine	0.50	10.51	9.30
Gold	0.40	.....	.....
Iron	11.70	8.59	10.15
Copper	4.10	3.59	0.41
Sand	1.40	1.69	1.22

The metal also occurs in some few locaities as the mineral sperrylite, an arsenide of platinum ($PtAs_2$) containing a little rhodium and antimony. This mineral has been found at Sudbury, Ontario; North Carolina, and at the Rambler Mine, Wyoming, U.S.A.

Sperrylite is of a tin-white color, has a metallic lustre and gives a black streak. Its hardness varies from 6 to 7; specific gravity 10.6. It crystallizes in the pyritohedral class of the cubic system presenting considerable resemblance in form to iron pyrites. When slowly roasted in an open tube sperrylite gives a sublimate of white arsenic and melts easily. At present this source of platinum is of little or no commercial importance.

Mode of Occurrence.

(1) "Placers."—Almost the entire output of platinum is obtained from "placer" deposits, typical examples of which are those of the Urals, Columbia and Brazil and British Columbia. The platinum "placer" deposits is probably in most cases derived from basic igneous rocks.

(2) "Veins."—Platinum (as sperylite) has been found associated with covellite at the Rambler Mine, Wyoming. It occurs native with gold at Tilkerode in the Hartz Mountains, Minas Geraes in Brazil, Santa Rosa, California, and Beresovsk, Russia, also with tetrahedrite and bournonite at Guadalcanal, Spain.

(3) Platinum disseminated in eruptive rocks.—(a) It occurs associated with nickeliferous pyrrhotite, copper pyrites and other nickel-copper ores in a hypersthene gabbro or norite at Sudbury, in Ontario. (b) Native platinum is met with in peridotite and other basic eruptive rocks rich in olivine intimately associated with chromite.

Localities From Which Platinum Has Been Obtained.

EUROPE.

Platinum has been found in very small quantities in Austria, Hungary, France, Germany, Great Britain and Norway.

Russia.—Over 90 per cent. of the world's output of platinum is obtained from Russia. The production in 1904 amounted to 161,139 ounces troy of the crude product. The metal is known to occur over a wide area, but the districts in which it is obtained on a commercial scale are comparatively few; the chief of these are situated along the eastern watershed of the Urals, the eastern portion of Perm and on the western watershed further south. The most important are the Nijni-Tagilsk, Goroblagodat and Bisersk districts.

The richest deposits of the two latter districts lie along the river Iss. The area is largely composed of peridotites, olivine-gabbros and their serpentine products.

The deposits, which average 4 feet in thickness, are of the "placer" type, and extend from 200 to 800 feet on each side of the present river. They have an overburden of peat or turf which varies from 5 to 20 feet in thickness.

In extracting the mineral the turf is stripped off, and the gravel transported to the sluices or to the mechanical washers, the latter being more usually employed in operations on a large scale.

The washer consists of a cylindrical tub at the botom of which is a circular iron pan 15 inches deep, perforated with holes five-eighths of an inch in diameter. Round the top of the pan runs a cast-iron pipe from which jets of water play into it. In the centre is a vertical shaft carrying a stirrer, which revolves about twenty-five times per minute. The gravel is fed continuously, and while the large stones remain on the pan the sands and clayey matter pass with the water through the holes direct to the riffle tables. Washing is carried on without intermission for about eleven hours, the concentrates are then washed on the tables several times, until reduced to a fine gray slime from which the gold is removed by means of mercury.

The residual material is sold as crude platinum. Dredges have recently come into use in the Iss valley in connection with this industry.

Spain. — Platinum in small amount has been found at the silver mines of Guadalcanal.

ASIA.

Burma.—Platinum is known to be associated with the gold of the "placer" deposits at Ava in Upper Burma.

Borneo.—It also occurs at Goenoeng, Lawack, in south-eastern Borneo, and is occasionally obtained in gold washings.

Japan.—Platinum together with iridosmine is reported to occur in the sands of the river Yubari, Ishikari.

AFRICA.

Algiers.—Platinum is said to occur with galena near Algiers, but the report lacks confirmation.

British Central Africa.—Traces of platinum have been found in a nickeliferous pyrrhotite received recently at the Imperial Institute from British Central Africa. No information as to the amount of this ore obtainable is available.

AMERICA.

Canada.—Platinum has been found in the sands obtained near Edmonton on the North Saskatchewan River in Alberta province. The gold washings of south-west British Columbia yield platinum in small quantities. The production in 1904 amounted to 35 ounces of the crude material valued at £2 10s. per ounce. This quantity was obtained from one working, viz., Granite Creek in the Similkameen, from the sluice boxes employed in washing for "placer" gold. In 1902 platinum was found in the black sands at several points on the Quesnal River, Cariboo district. Assays of these sands showed gold to be present in amounts varying from 0.2 to 121 ounces per ton and platinum from 0.14 to 7.8 ounces per ton. The Consolidated Cariboo Co. in 1904 reported the presence of appreciable quantities of platinum in the heavy concentrates remaining in the sluice boxes after the "clean up," and they are now taking steps to collect and treat these concentrates. The platinum, palladium and osmiridium occur in minute metallic grains which are enclosed in fragments of chromite and magnetite.

Platinum has also been found in the copper sulphide obtained from the Yale district; the amount present, however, would not admit of its commercial extraction, unless it were recovered from the slimes after electrolytically refining the copper.

Platinum occurs as sperrylite in the copper-nickel ores of Sudbury, Ontario. The nickel-copper matte, as exported contains about one ounce of platinum per 1,000 lb. Some of this is now recovered by the Oxford Copper Co., of Constable Hook, N.J., in refining this matte.

The metal is reported to occur on the south bank of the St. Lawrence river in the Eastern Townships of Quebec.

United States.—The United States in 1904 produced 200 ounces of platinum valued at $2,600. The greater quantity of the metal was obtained from the gold "placer" deposits in Trinity and Shasta counties, California. Platinum is known to occur in the "placer" deposits of Washington, Oregon, Idaho, Montana, Colorado, and Alaska, but in quantities insufficient for commercial working.

It also occurs as sperrylite ($PtAs_2$) associated with covellite (CuS) in the Rambler District, Wyoming, and it was estimated that platinum to the value of $6,000 was contained in the slimes from the copper ore raised in 1904.

South America.—The production in 1904 amounted to 9,625 ounces; this was largely obtained from Colombia. This country ranks second to Russia as a producer of the metal. The most productive district is El Choco in the provinces of Atrato and San Juan, the latter being the larger producer.

AUSTRALASIA.

New South Wales. — The production of crude platinum in 1904 was 535 ounces valued at $10 per ounce as compared with 530 ounces in 1903.

This yield was almost entirely obtained from an area of about two square miles at Fifield. The working is a deep alluvial lead containing platinum and gold, the sinking being through 60 or 70 feet of loam, having some bands of barren quartz and drift. The wash dirt contains 5 to 12 dwts. of platinum and 1 to 3 dwts. of gold per ton, but owing to the scarcity of water the deposits are only worked during a few months of the year.

Platinum has also been found in the sands at Aberfoil river, on the sea coast between Richmond and Clarence rivers, and in felsite and granite at Broken Hill.

Queensland.—Traces of platinum together with gold and tin-stone have recently been reported in the beach sands of the south-east coast. The sands contain from 0.12 to 0.64 per cent. of tin-stone (3.4 to 8.12 lb. per ton), and from 5 grains to 1 dwt. 19 grains of gold per ton and 3 dwts. to 7 dwts. 2 grains of silver.

Tasmania.—Platiniridium is obtained along the Savage river and platinum from the sands of the Wilson river. The "placer deposits" of western Tasmania are of commercial importance on account of the iridosmine they yield. Platinum has been reported to occur together with vanadium in the ash of certain Australian coals.

New Zealand.—Platinum is known to occur over a wide area, usually associated with gold washings.

Some of the river sands in the southern part of Middle Island and those of the east coast of Otago are said to yield the metal; it has been reported also to occur in eruptive rock near the Takaka river.

The following observations made by Mr. J. F. Kemp, of the U.S. Geological Survey, as to the indications of the occurrence of platinum give a useful summary of what is known on this subject:—

(1) Experience so far gained leads to the conclusion that platinum is very sparsely distributed in its mother rock and the chances of finding it in quantities sufficient to mine are small.

(2) Large and permanent "placers" are to be looked for only in very old land areas which have been subjected to protracted degradation and concentration.

(3) In the assay of antimonial, arsenical and other copper ores, but especially of tetraherdite (gray copper or "fahlerz"), it is worth while to look for small percentages of platinum.

(4) Deposits of chromite deserve similar testing.

It may be stated that pyrrhotite, the lower sulphide of iron, often contains traces of platinum, especially when nickel, copper and cobalt are present.

It must be remembered that mercury does not readily amalgamate with platinum. Therefore in methods of working auriferous "placer" deposits in which the gold is saved by means of mercury, the platinum is liable to be lost unless special means are taken to preserve it. If, therefore, traces of platinum are suspected or known to occur, the gold and platinum should, as in Siberia, first be collected by riffles or "blanketing" and the separation subsequently effected by means of mercury.

Even in the use of riffles or other mechanical means of retaining platinum more care is required than in the case of gold.

PROSPECTING WITH CHURN DRILLS.

By F. S. Pheby.

Several diamond drills are at work in the Cobalt district, but, it is quite possible, under certain conditions, churn drills would serve the purpose. In this connection, a very useful paper by Mr. F. S. Pheby, may be read. It was contributed to the Mining and Scientific Press of San Francisco. Of course, the items of expense would differ very considerably in Cobalt, and, on the whole, the cost should be less in Northern Ontario than in Nevada. Mr. Pheby writes:

Believing that the great horizontal ore-bodies of the Ely district could be more cheaply and expeditiously tested by the use of the drill rather than through the usual tedious and expensive method of shaft-sinking, the Ely Central Copper Co. purchased two drills, manufactured by the Keystone Drill Co., Beaver Falls, Pennsylvania. These drills were hauled from Cherry Creek, to the mines, a distance of sixty miles. These machines are type No. 3 and weight 12,000 lbs. each. A complete outfit of tools and equipment for recovering any parts of the drills lost in boring the holes, were included in the order.

The first drill was installed on the property in August and we had a hole completed to a depth of 308 ft. within 23 days, although but one shift was engaged in this work. It is far more economical in wood and water to keep the drills running continuously with three shifts. More than three times the sinking can be done in the same number of days, as steaming up in the morning generally comes out of the one shift. The drill averaged 13.3 ft. per shift for the 23 shifts, but if shut-downs are deducted, the drill averaged 19.6 ft. per shift of actual operation.

We have found in all our work that casing is necessary in every hole. At times we have sunk 200 ft. without casing, but to go deeper casing was necessary, which meant that the hole had to be rimmed out at an expense of more than the original cost of the hole for the 200 ft. I caution anyone contemplating the purchase of a drill, to provide 7⅝ casing for one-third the depth contemplated, 5⅝ casing for two-thirds the depth, and 4¼ casing for full depth. This we had not done, and probably 25 per cent. has been added to the cost of each hole, worked without sufficient casing. Trouble may not be encountered in several hundred feet, but a soft stratum of ten feet will require casing for the entire hole.

We soon learned that the wear and tear on the drilling cable was severe. Under ordinary circumstances, each rope is safe for 1,500 feet of drilling. When we appreciated that our ropes were deteriorating, an order was placed at once. By October 1 the cable had not arrived, and we were compelled to order by express from Ohio a coil of rope weighing 1,850 lb. With each drill, two ropes of the same length as the depth of the hole contemplated should be ordered.

Water is required for both the boiler and for diluting the drillings so that the sand-pump may bale them. The greater quantity is required for the boiler. This item of expense is local with each hole. It is advisable to haul water in a good wagon-tank, as the drills may be moved many times, and the cost of pipe might be greater than the cost of hauling. A drill-man and helper are required on each shift; the former receiving $4 for eight hours' work and the latter $3.25. The item of fuel and water is wholly relative, but will be given in our particular case, and may be taken as an average for this district.

The following is the tabulated costs for a certain hole which we have taken as an average:

Shifts of sinking (eight hours each)	23 days.
Depth of hole	308 feet.
One drill-man, wages	$ 82.69
One helper and assistance while handling casing	81.08
¾ cord of wood each shift, at $4.50 p. cord	77.51
12 bbls. water at $6.50 for hauling, 8 days.	52.00
12 bbls. per day (when running two rigs), 15 days	48.75
Coal and oil	7.60
Miscellaneous charges	12.20
Superintendence	50.00
Cost of 308-ft. hole	$411.83
Cost per foot	$ 1.33

Some water was encountered in this hole, and I may say roughly, that a two-compartment shaft for

the same depth with equipment, would have cost about $12,000, or $40 per foot.

The question has often been raised concerning the character and accuracy of the sample obtained from this work. With small rich veins there may be an objection to the use of drills, but in ore-bodies like those found at Ely, I believe as good a sample can only be taken with great care. Most of the sludge or drillings will pass a 20-mesh screen, and a good method is to provide a large box with a capacity equal to several screw-lengths. I might say that a screw is three feet long, and when fed out, the clamps are changed on the rope, and the hole baled, or sand pumped. By settling and decanting the water, the entire product of the hole may be saved and sampled. In ordinary practice it is sufficient to dip a sample from the box and pour the same into a box partitioned off in compartments about the size of common brick. This sample, when dried in the sun, is compact enough to be sampled by chipping, and can be shipped and carried about without breaking.

In a hole carried down without casing, there is danger of knocking down particles from the upper portions of the hole. This will vitiate the sample, but the harm done is more theoretical than actual. As is well known, the ore-bodies of Ely are the impregnation of a great stockwork of porphyry, and an ore-body of much value must be a hundred or more feet thick. While actually in ore, the sampling must be done with extreme care, but often the hole, all or in part, may be in barren country rock, and only a knowledge of the formation penetrated is desired.

The best test, where not in ore, is obtained by panning the sample. This concentrates the coarse particles, which are clear to the eye if a magnifying glass of low power is used. In oxidized formations some doubt often arises as to whether the drillings are composed of porphyry or limestone. A small bottle of dilute hydrochloric acid will soon settle this question with entire satisfaction. We have made a practice of saving a sample of each formation penetrated, in four-ounce bottles. This gives a clear picture of the hole, and is valuable for future reference.

Our drills are provided with traction gears, and may be moved at will over the roughest ground. This saves the expense and trouble of procuring teams. The winter weather is severe for outside work, and sectional houses, so made as to be readily knocked down and moved, have been constructed to enclose the drills, and within these houses the men work in comfort.

The cost of a No. 3 drill is as follows:

Drill f. o. b. Beaver Falls	$1,400
Cost of casing for 400 ft. and fishing tools	350
Freight to Cherry Creek, Nevada	328
Hauling 60 miles from Cherry Creek	225
Cost of No. 3 drill, good for 500 ft., laid down on the ground	$2,303

A drill of this size is light for holes of greater depth than 500 ft. The size recommended is a No. 5, good for 1,200 ft., and the cost of the same with traction gear, is about $2,500 laid down at Ely. Should five holes of 500 ft. each be sunk, the cost of equipment per hole will be $500, about the price of a good whim outfit. The cost of $1.50 per foot is so much cheaper than any shaft work as not to be comparable. Water does not retard the work of drilling; in fact, it is a benefit.

I can heartily recommend the use of three drills for prospecting in this region. Apart from the cost per foot, the time in which a good working knowledge of the ground can be obtained, is a great factor. The sample is quite as good as a core, and most ground can be penetrated at 25 per cent. of the cost incurred with a diamond drill; while the expense of equipment will not exceed 30 per cent. that of the diamond-drilling outfit.

THE PRODUCTION OF PLATINUM*

By F. W. Horton.

The year 1905 saw a phenomenal rise in the price of platinum and a greatly increased production in the United States. The annual report of the United States Geological Survey on the production of platinum, shows that early in March, 1905, the price of ingot platinum advanced from $19.50 an ounce to $21 an ounce, surpassing gold in value. On April 1, 1905, the price fell to $20.50, and remained firm at this quotation until February 1, 1906, when it jumped to $25 an ounce, where it remained until Sept. 1, or about six weeks ago, when it leaped to the unprecedented value of $34 an ounce. The production of platinum in the United States increased from 200 ounces in 1904 to 318 ounces in 1905.

The rise in the price of platinum and its increased production in this country may be ascribed to two causes; the growing demand for the metal and the reduced yield of the Russian platinum placers, which usually furnish about 90 per cent. of the world's supply.

The anxiety felt by the platinum dealers during the Japanese-Russian war has not abated since the settlement of international difficulties, but has rather increased as Russia's internal dissensions have developed. Even before the uprisings, it is said, the large Russian mines were purposely curtailing their production. This reduction of the output is due to the fact that the entire product for a varying term of years was bought up under contract and at prices that now seem ridiculously low. As the mine owners receive only the fixed price, they do not participate in any gain due to rise in value, and are therefore not desirous of a large production, but are husbanding the limited resources of their mines until

* From Advance Sheets, Mineral Resources of the U.S.

such time as they can dispose of their product to better advantage. Meanwhile the small mines, which, generally speaking, are not hampered by such agreements, are working to their full capacity to take advantage of the stimulated prices; but their entire output is only a small percentage of what is usually produced. A greatly increased consumption of platinum in the electrical and chemical industries, together with this stringency of supply, accounts for the prevailing high prices.

The exhaustive tests and examinations of black sands commenced early in 1905 in connection with the Lewis and Clark Exposition, and still being carried on at Portland, Oregon, by the United States Geological Survey, have done much toward placing platinum mining in this country upon a stable footing and developing it into a permanent and profitable industry. Not only have many discoveries of platinum in new localities been made, but the tests have revealed the fact that there are in this country districts which contain surprising quantities of platinum, and they have also given much valuable data as to the best method of obtaining it.

Platinum is now known to exist in 15 counties in California: Butte, Calaveras, Del Norte, Humboldt, Mendocino, Nevada, Placer, Plumas, Santa Barbara, San Luis Obispo, San Bernardino, Shasta, Siskiyou, Trinity and Yuba; in nine counties in Oregon: Baker, Coos, Curry, Douglas, Jackson, Josephine, Lincoln, Linn and Union; in eight counties in Idaho: Ada, Bingham, Boise, Elmore, Idaho, Nez Perces, Oneida and Shoshone; in four counties in Colorado: Chaffee, Park, Saguache and San Miguel; in three counties in Washington: King, Skagit and Whatcom; in two counties in Montana: Custer and Granite: in Utah, in Garfield County; in Arizona, in Yavapai County; and in Wyoming, in Albany County. The metal is also rarely found in Alaska and in the gold-bearing sands of Corozal river, Porto Rico. Isolated occurrences of single nuggets or mere traces of the metal have been found in many other counties of these states, as well as in four of the eastern states, namely, New York, Pennsylvania, North Carolina, and Georgia. In many of these localities the metal occurs but sparingly. The most promising fields are in the counties of Southern Oregon and Northern California. Here the metal has been found in commercial quantities. With proper methods a considerable annual output should be obtained.

The platinum metals are usually found in working gold placers, especially where the gravels are derived from peridotites. Many managers of placer mines have been convinced for a long time that it would pay to save the platinum in gravels, if it could be done by some inexpensive method. The experiments of the Geological Survey which were conducted under the supervision of Dr. David T. Day, have shown conclusively that 95 per cent. to 98 per cent. of the precious metals, both gold and platinum, contained in the sluice box sands can be saved on concentrating tables of the Pinder or Wilfley type, such as are used in every day practice; and that in most cases the concentrates thus obtained will represent less than 1 per cent. of the total weight of sand fed to the table.

Besides discussing the experiments made in the recovery of platinum in this country, Mr. Horton describes the methods of extraction in vogue in Russia. He also reviews the localities in which platinum-bearing gravels have been noted in Russia, Colombia, British Columbia and other countries, describes the physical properties of platinum and its associated metals, and sets forth their uses. A brief bibliography of platinum, with which the report closes, is not its least valuable feature.

It should be noted that the imports of platinum during 1905 were valued at $2,173,263, as against $1,879,155 in 1904, an increase in value of $294,108. Considering the increased demand for platinum, the gain in importation is slight, but if the high price and scarcity of the metal be taken into account the wonder is that there was not a large decrease in the quantity imported.

A STORY OF ENDEAVOR.

By Nemo.

This untrue and most unveracious narrative has to do with the activities, methods, success and failures of certain brainy and adventurous men, who, with all the qualities for greatness, lacked but one element of success, as mining promoters,—they really tried to get a mine. There were three. Money they had none, work they would not, and to beg, well, perhaps, they were not ashamed, but they were ambitious, and they had probably hit every man who could be "broke up" for a small loan; that occurred to them, so often, that this well was dry.

And they had to do something last spring, not from choice or the working of an unquiet spirit, but because they had to.

It was about the time the ice had broken up on the Timiskaming Railway, and the first crop of Cobalt promoters, with their slabs of silver, had struck Montreal, before the Nipissing cargo, in the charge of an expert, had moved on Cobalt. But these three men saw that the bait was good, they knew the crop of suckers was large, even in staid, hard-headed Montreal, and they had to do something. They did it.

They organized the Cobalt Unlimited, with a capital stock of $7,000,000, under their hats, so to speak—(let it be trusted they were new)—and they at once started off to sell rights to stock. They had neither a mine, a charter, a company nor a stock certificate, but they sold rights that netted them a cool $3,000. Could the names of the gentlemen, who parted with this sum of good, cold dollars, be but printed in full, this issue of the Mining Review

would displace every alleged humorous publication that at ordinary times comes to Montreal. The very babies would cry for it, and if there wasn't such a cruel law of libel in this country the list would be printed. We believe that it would be possible to prove the truth of the list, and that it was in the public interest, but it would take too much time to do it. Let this be enough. There are names on the cheques that were parted with for "rights" "when issued" to stock in Cobalt Unlimited, that are supposed to mean close-fisted, shrewd, hard-headed, conservative, thoroughgoing business, with big profits and big sales, in the commercial world.

With three thousand dollars in their hands, the business went on gloriously. The gentlemen felt that they had found the goose that laid golden eggs at last, and they rejoiced much and proceeded to spread things. They paid back some of their "loans," bought new overcoats, smoked twenty-five cent cigars, instead of six for a quarter, and were prosperous, very. Incidentally, they took an office, got in a typewriter on 30 days' trial, and proceeded to cultivate the goose. Perhaps the office and the typewriter frightened the gentle and sensitive bird, perhaps it was the fact that the $3,000 (minus expenses) behind them affected their husbandry. Whatever was the cause, from the time they started in with "an organization," the eggs ceased to arrive. Instead of recognizing that there was a perhaps, these three bold and energetic souls pitched in on the organization side. They applied for and obtained a charter for the "Cobalt Unlimited." We believe that this charter is a work of art that discounts Byam Shaw, the Canadian archives, or the Bucket Shop Code; that it stands a monument to what can be done, when you try. They contracted for a block of stock certificates, something in aluminum dust and purple ink, which if used for wall paper would stop a clock, and, incidentally, about this time they got in another typewriter on 30 days' trial, and "threw down" a hard working and enterprising typewriter man, after using his machine for thirty days. About this time, also, the inroads of a month's hilarious organization made itself felt on the bank account, and the goose was behaving worse than ever. What should they do?

Still working on the organization idea, they decided that they had better buy a mine, and one of their number actually went up to Cobalt, and bought it. More than that, he paid for it, that is, he paid $1,000 for an option to pay $100,000, more or less, for a forty-acre section of fine looking rock, within the traditional sixty days. And not satisfied with this cruel devastation of the company's funds, he allowed a man with some letters after his name, to do him out of $250.00 for a "report" on the magnificent property.

This report was not an exhaustive or wordy document. It was a simple statement that the property in question consisted of a mass of fundamental granite without any particular crack or flaw in it, and if any mineral was ever to be found thereon, it would have to be put there first.

By this time there wasn't any of the $3,000 left, not even enough to pay the printer for the certificates. The first fine, careless rapture was gone; the man who had put in the third typewriter on trial wanted his money; the weather was warm, and there was a taint of Nipissing in the air; and the adventurous three forsook their organization, abandoned their charter, and vanished, as far as possible, from the usual haunts of certain gentlemen anxious to get something for "rights," followed by "when issued."

This is the sad tale, so it is. Had these adventurous souls gone on as they began, they might be endowing colleges by this time.

ASSAYING COBALT CAMP ORES.*

By F. F. Colcord.†

The ores from the Cobalt district are extremely varied, both in the metal contents and in the character of the gangue. Below are some typical analyses of ores from different parts of the district.

Ag. Oz. per Ton.	SiO_2 p.c.	Fe pc.	CaO p.c.	As p.c.	Ni & Co p.c.
300	4.0	4.0	5.0	55.0	14.1
350	53.0	12.4	2.2	5.7	4.1
400	46.1	5.8	4.0	6.2	....
3,000	10.0	6.0	5.0	41.0	....
3,000	28.3	....	21.7	2.4	....
5,600	8.3	....	10.3	27.8	....

The one point of similarity in these ores is that on grinding and sifting, metallics remain on the sieve. These metallics, as a rule, contain about 70 per cent. of silver. In some ores large pieces of native silver are present. All this makes sampling an extremely difficult task. The method of sampling used is a form of the alternate shovel, combined with the coning and quartering method

Sampling.

The whole lot to be sampled is crushed and rolled to 0.25 in size and thoroughly mixed. It is then piled in a ridge about 30 ft. long, and again turned over and mixed. The ridge is then halved by alternately shovelling to either side, forming two parallel ridges, of which one is rejected and the other halved as before. This is continued until a 5,000- to 6,000-lb. sample is obtained. This sample is then coned and quartered to about 1,000 lb., which is put through the rolls until it all passes an 8-mesh sieve. If any metallics show on the sieve they are ground in a drug mill and mixed with the fines. The sample is next worked down to about 40 lb. with a Jones sampler, and sifted through 20-mesh. The metal-

* From the Engineering and Mining Journal.

† Chief chemist, American Smelting and Refining Co., Maurer, N.J.

lics, if any remain on the sieve, are ground and then thoroughly mixed with the fines. The 40-lb. sample is halved once with the sampler, one half being reserved and the other prepared for the final sampling by again sifting on a 20-mesh sieve and treating any metallics as before. The sample is then quartered down with the sampler to about 5 lb. and accurately weighed. The 5-lb. sample is sifted on an 80-mesh sieve, the oversize, consisting of ore and metallics remaining on the sieve, is ground for two hours in a pebble mill. After grinding, this portion is again sifted. The oversize is pounded in an iron mortar to free it from adhering fines and then sifted. The oversize (metallics) is weighed, mixed and divided into the requisite number of samples. The fines likewise are thoroughly mixed and divided.

All the rejected portions are again shovelled to the original ridge formation and the entire operation repeated three times. Thus four separate and distinct samplings are made of the lot from start to finish. The four samplings should agree within reasonable limits.

Assaying.

Two methods of assaying the fines are used according to the grade and character of the ore. The first method is usually applicable to ores under 400 oz. in silver and is as follows: Four ½ A. T. portions are fused in F Denver crucibles with 200 grams to each charge of the following flux: Bicarbonate of soda, 10 parts; litharge, 20 parts; potassium carbonate, 3 parts; silica, 3 parts; borax glass, 4 parts. Enough reducing agent is added to each charge to reduce a 30-to 40-gram button. A cover of salt is used.

The lead button obtained is scorified once in a 2½-in. scorifier, cupelled and weighed as usual.

The second method for ores over 400 oz. in silver is a variation of the combination method for silver. Six to eight ½ A. T. portions are weighed into 1000-c.c beakers. The ore is covered with 100 c.c. of nitric acid and heated to boiling. The boiling is continued for 20 minutes or until decomposition is completed. When decomposed, 300 c.c. of water is added to each, the solution stirred and allowed to settle. The solution is filtered and residues washed. The residues thus obtained, containing most of the arsenic and only a small amount of the silver, are burned, scorified and cupelled as is customary. The silver in the filtrates is precipitated with salt solution, stirred, allowed to stand over night, and washed. The precipitates are burned, scorified and cupelled as usual. The special point is that the residues and the precipitated silver are run separately. The weights of the silver buttons from the residues are added to those obtained from the precipitation and their total reported.

The metallics are assayed by weighing six to 10 portions of 1-10 A. T. each into 2-in. scorifiers. They are mixed with 15 grams of test lead, two grams of borax glass and silica (equal parts) and covered with 10 grams of test lead. They are then scorified and cupelled in the usual manner.

The final assay is calculated from the assays of the fines and the metallics according to their respective percentages in the ore.

THE CANADIAN ROCKIES.*

In point of area, if not as certainly in point of total volume above sea, the western mountains of North America constitute by far the greatest system of the earth. This vast region has always been very sparsely inhabited. In the orographic features it is generally complicated, often to the uttermost. Its exploration is only well begun. There are thus excellent reasons why the mountain units of this region are so inadequately named and systematized in geographical works, whether issued as official Government reports, as educational text-books, or atlases, or as popular records of travel. Yet, whether he will or no, the explorer responsible for a report on any part of this region must confront the question of names. He returns from his rugged field, to tell of his findings, must use common nouns to indicate what kinds of land-relief he has found, and proper names to aid in individualizing and locating those reliefs in the huge backbone of the continent.

This duty has fallen to the writer in the task of reporting on the geology of the mountains crossed by the 49th parallel boundary between Canada and the United States. Though the same transmontane section has been described by the geologists attached to the 1857-61 commission, though it occurs along the most thickly settled part of British Columbia, and though it is nowhere very far from the lines of two transcontinental railroads, a complete and systematic grouping of the mountains on the boundary was never been made. The difficulty of supplying the lack was felt by the writer in the first of five seasons devoted to the geology of the boundary, but the difficulty was more fully realized as the dire confusion of the nomenclature already in vogue became apparent.

It is manifest that any attempt to develop a constructive view of the boundary mountains should be founded as far as posible upon established units already understood and named. The literature has, therefore, been carefully searched to furnish this required foundation. The result has shown a truly surprising variety of usages in names and in concepts of the topography. The course of compilation inevitably led to the study of the nomenclature of western ranges even far away from the 49th parallel of latitude. Examples of the differences of usage are recorded in the first part of the following paper.

---

* Published by permission of the Canadian Commissioner, International Boundary Surveys.

The record may serve in some degree to illustrate the need of a consistent scheme of nomenclature, possibly to suggest partial grounds on which uniformity may some day be established.

The second part of this paper is concerned with a brief account of the nomenclature that seems most appropriate for the ranges crossed by the international boundary.

The search for the variations of nomenclature was made both among authorities responsible on the ground of priority and among authorities influential as standard compilers from original sources. For the present purpose of indicating the lack of uniformity and the confusion into which the great mass of the people may be led by consulting existing works of reference, it is not sufficient to record names found only in Government map or careful scientific monograph. Perhaps more important still in this connection is the record to be made from standard atlases, from school geographies, and from standard influential guide-books. In reality, it has required the examination of but a very limited number of each kind of authoritative works to point the moral. With few exceptions the only works consulted were printed in the English language.

The question of the best general title for the western mountains may be considered as trite by those who do not feel the immediate need of its solution in their professional work. The writer by no means believes it to be trite, as he now completely realizes the wide latitude in naming among the recent influential publications dealing with North American geography. It is scarcely to the credit of our geographical societies and alpine clubs that they will publish at length the statement of one traveller that he found mosquitoes in Newfoundland, of another that his hotel accommodation in Manila was bad, and leave undiscussed the suggestive paper of Prof. Russell and his correspondents on the names of the larger geographical features of North America. There would be no advantage to the European geographers if the Alps masqueraded under a dozen different general titles dependent on the personal tastes of individual writers on those mountains.

(To be continued.)

COBALT SHIPMENTS DURING DECEMBER.

The Canadian Mining Review has been favored with the following detailed statement of Cobalt shipments during the month of December through the courtesy of the Minister of Public Works for the Province of Ontario.

Car No.	Init.	Weight.	Consignor.	Destination.	Date.
27200	G.T.	41,600	Nipissing Mine	New York	December 1.
27475	"	43,100	Nipissing Mine	New York	December 1.
13005	"	62,500	Tretheway Mine	Bergen Junc.	December 1.
5871	"	66,300	La Rose Mine	New York	December 2.

5849	"	60,000	O'Brien Mine	Bergen Junc.	December 31.

Shipments from Haileybury were nil.

THE WAY OF THE NORTH.

On the first day of the year the merry Cobalters held a dinner at the Cobalt Opera House.

Milton Carr was master of ceremonies and introduced the speaking by proposing toasts to King Edward and President Roosevelt, which were drunk while the appropriate national anthems were rendered. Dr. W. H. Drummond responded for "Our Country," W. H. Linney and C. F. Loring for "Our Guests," H. V. P. Adler and H. H. Lang for "The Mining Industry," and J. W. Osborne for "The Ladies."

After the repast the assembled guests broke into song, one of the contributions being an adaptation of new words to a well known air "The Good Old Summer Time."

A man named La Rose stubbed the end of his toes
On a rock he was blasting one day,
He said, "this is silver, I'll send it to Miller,
And get him to take an assay."
When Miller received it he scarcely believed it,
He cried, "This is surely sublime!"
So the mining commission got out an edition,
Describing Cobalt in its prime.

Chorus:

The good old summer time, the good old summer time,
Strolling up and down the hills, looking for a mine,
Searching for a calcite vein, or any other old sign,
And that's the way we spend our coin in the good old summer time.

THE TRETHEWEY.

There are forty acres in the Trethewey property, but the development work to date has been done entirely on three veins and only about four acres of their holding have been prospected.

Six veins have been uncovered, and one of these, where practically no work has been done, has been traced and uncovered for 400 feet and has high silver values.

The early work at the Trethewey consisted of huge open cuts, and stoping. Stoping has been done on vein No. 1 to the east of the shaft for a distance of 45 feet and a depth of 50 feet.

This stope is about ten feet wide, and from it $250,000 worth of ore has been removed. The distance between the foot and the hanging walls was between five and six feet, and a rich ore body here had a consistent width of from six to eight inches.

Since taking out this vein matter the stope has been widened five feet, as the silver shot wall rock was too valuable to leave in place. It is intended to take out still more of this country rock as it will continue to be profitable.

To the west of the shaft stoping was also done to a depth of twenty-five feet, and the ore from this stope and the open cut about seventy-five feet distant realized about $200,000.

Vein No. 1, on which the shaft has been sunk, and where the above stoping and open-cut are, has been traced for several hundred feet. The shaft has reached a depth of 120 feet and drifting done at the fifty-foot and 100-foot levels.

The east drift at the former level is 160 feet long and to the west a distance has been reached of sixty feet. At the 100-foot level about fifty feet of drifting has been done.

Cross Cut Strikes Coniagas Vein.

At the fifty foot level a cross cut has been started to encounter two veins which have been located about sixty feet away on the surface. One of these is a continuation of the Coniagas vein "A," which runs almost into the corner of the present Trethewey office. The other is within a few feet and nearer the line between the two properties.

Before the cut had been carried twenty feet a blind lead was encountered, and even in the cross-cut a little seam or calcite stringer was discovered, which is a most remarkable occurrence, and makes this part of the property look as if every crack were mineralized.

From the same fifty foot level there will be another cross-cut to the tunnel, from which rich ore was taken to the value of $30,000. At the most, only about one acre has been thoroughly prospected, and to the north of where the above development has taken place there lies 1,000 feet at least, running the width of the location, so that it looks as if there was a long future for the mine.

Daily Assays Are Made.

Systematic daily assays are made of the ore taken out and records kept. The first class ore averages 2,000 oz. of silver to the ton. The second grade ore runs sometimes as high as 1,100 oz., but averages about 250 oz., and the screenings have to date shown the same value as the second grade ore. Even an assay is made of the dump twice a week. So far it has run about 16 oz. per ton.

Ninety men are at present employed, but with the completion of the buildings large additions to the force will be made. At present men are crowded together in the sorting-room. A large ore house and sorting rooms are being built behind the shaft house. When completed a crusher and a sampler will be installed and the ore will be sorted on three tables, each thirty feet long, being washed with warm water as the work is being done.

METALS.

The average price of metals during 1906 was as follows:

Silver—New York, 60,352 cents per oz. fine; London, 27,839 pence per oz., .925 fine.

Copper.—New York, electrolytic, 15.590 cents per lb.; Lake, 15.699 cents per lb.; London, £69.465 per ton of 2,240 lbs.

Tin.—New York, October price; latest quotation obtainable, 42.852c per lb.

Lead.—New York, October price; latest quotation obtainable, 5.750c per lb. London, the London average per ton of 2,240 lbs., was £19.350.

Spelter.—New York, October price, 6.222c per lb. London, £28.075 (Oct. price), per ton of 2,240 lbs.

IS MATTER ELECTRICITY?

Hitherto, that is to say, until the discovery of radium and its marvels, matter was considered as composed of atoms, and atoms, of course, were thought to be the smallest particles of matter. All this is now changed, as we have often pointed out, and the atom itself is now composed of much smaller particles called electrons, or corpuscles.

The corpuscle, we are now told, is in reality nothing but a disembodied electrical charge. A corpuscle contains nothing material. It is electricity. It is nothing else. Instead of speaking of the corpuscle we should speak of the electron. The electron is, then, a disembodied electrical charge, containing no matter, and is the term which will yet be employed to designate this ultimate unit of which all so-called matter is probably composed. And if the electron contains nothing that corresponds to our ordinary conception of matter, and since the same electron can be split off from atoms or from the molecules of all substances, the question naturally arises: Is not all so-called matter of an electrical nature?

This query, set forth by Dr. Harry C. Jones, Professor of Physical Chemistry, is answered boldly by him. There

is a large and increasing mass of evidence, says Professor Jones, warranting the belief that the line separating matter from electricity is on the point of disappearing. Indeed, this conclusion is accepted, at least tentatively, he says, by a considerable number of the leading physicists and physical chemists the world over.

This theory makes the electron—the corpuscle, as some prefer to call it—the ultimate unit of all matter. The atoms are made up of electrons or disembodied electrical charges in rapid motion. The atom of one elementary substance differs from the atom of another elementary substance only in the number and arrangement of electrons contained in it. Thus, we have at last the ultimate unit of matter, of which all forms of matter are composed. The remarkable circumstance is, says Professor Jones, that this ultimate unit of matter—of which all matter is composed—is not matter at all, as we ordinarily understand that term. It is electricity.

It cannot be too strongly insisted upon, Professor Jones is represented in Popular Science Siftings as saying, that matter is a pure hypothesis. What we know in the universe, and all that we know, is change in energy. In order to have something to which we can mentally attach the energy, we have created, in our imagination, matter. Matter, then, is a pure hypothesis. Energy is the only reality. We are accustomed to take exactly the opposite view and to regard matter as the reality and energy as hypothetical. But not only is matter a pure hypothesis, but we have not the least evidence for its existence, as we ordinarily understand the term. And it is interesting to note that Ostwald and Thomson have reached the same conclusion on a point of far-reaching importance in connection with any theory of matter that may finally prevail.

All atoms of whatsoever kind, if all that has preceded be correctly presented, are made up of electrons. Electrons are nothing but negative charges of electricity in rapid motion. In accepting this wonderfully simple and beautiful theory that the nature of all matter is essentially the same, we must not forget, proceeds Professor Jones, that the facts of chemistry and of physics have to be accounted for. We must remember that we have over seventy apparently different forms of matter which cannot be discomposed into anything simpler or into one another, by any agent known to man.

We must, to quote Dr. Jones, also remember that these elements of the chemist have each their definite and distinctive properties, both physical and chemical. They enter into combination with one another in perfectly distinctive ways and form compounds with definite and characteristic properties. In a word, we must remember the almost unlimted facts of chemical science, which are facts, regardless of whatever conception of the ultimate nature of the matter we may hold.

WHAT IS MEANT BY "ARTESIAN."

The significance of the term "artesian" is discussed with great care by Mr. Myron L. Fuller, of the United States Geological Survey in Water-Supply and Irrigation Paper No. 160. While there is considerable diversity of practice there is nevertheless a general tendency to give the term one or other of two meanings, and about fifty geologists throughout the country have expressed their willingness to accept any definition agreed on by the majority of active workers on underground-water problems.

Discussing the original use of the term artesian (as applied to flowing wells first observed in the town of Artois, France), the use of the word in recent scientific literature, in Europe, and the present scientific and popular use of the term in this country, Mr. Fuller makes clear that no definite meaning can be assigned to the word artesian in a publication unless a definition is given in the same paper. It is even found that the same writer employs it differently in the different publications.

The predominant scientific usage of the term is for all wells in which the water rises; in other words, for those exhibiting the hydrostatic or artesian principle. In popular practice it is applied, in addition to the uses previously mentioned, to deep wells in general, especially those in rock, and to a certain extent to any drilled wells yielding water of good sanitary quality.

After discussing the arguments for these various uses, Mr. Fuller gives the following definitions which were agreed on by the members of the Division of Hydrology of the Survey as the most expedient at the present time

Artesian principle.—The artesian principle, which may be considered as identical with what is often known as the hydrostatic principle, is defined as the principle in virtue of which water confined in the materials of the earth's crust tends to rise to the level of the water surface at the highest point from which pressure is transmitted. Gas as an agent in causing the water to rise is expressly excluded from the definition.

Artesian pressure.—Artesian pressure is defined as the pressure exhibited by water confined in the earth's crust at a level lower than its static head.

Artesian water.—Artesian water is defined as that portion of the underground water which is under artesian pressure and will rise if encountered by a well or other passage affording an outlet.

Artesian system.—An artesian system is any combination of geologic structures, such as basins, planes, joints, faults etc., in which waters are confined under artesian pressure.

Artesian basin.—An artesian basin is defined as a basin of porous bedded rock in which, as a result of the synclinal structure the water is confined under artesian pressure.

Artesian slope.—An artesian slope is defined as a monoclinal slope of bedded rocks in which water is confined beneath relatively impervious covers owing to the obstruction to its downward passage by the pinching out of the porous beds, by their change from a pervious to an impervious character, by internal friction, or by dikes or other obstructions.

Artesian area.—An artesian area is an area underlain by water under artesian pressure

Artesian well.—An artesian well is any well in which the water rises under artesian pressure when encountered.

Mr. Francis F. Coleman, formerly with the Westinghouse and Allis-Chalmers companies and recently with the Traylor Engineering Co., has joined the Lidgerwood Mfg. Co., as publicity manager. Mr. Coleman takes to the service of the Lidgerwood Mfg. Co. not only a large amount of experience gained in the service of the companies mentioned but an interesting literary style acquired during many years of experience on the New York Sun and other metropolitan newspapers. Mr. Coleman was for a time the editor of the Electrical Age before the late Louis Cassier bought that publication. While with the Westinghouse Company he wrote the catalogue of the Westinghouse Steam Turbine. During his engagement with the Allis-Chalmers Company he designed and edited the new series of catalogues and bulletins which that company issues and wrote the two admirable special publications issued by the company in 1904-5, "The Book of the Four Powers" and "The Power of the Subway." During the existence of the Louisiana Purchase Exposition at St. Louis, Mr. Coleman was in charge of the three large exhibits there of the Allis-Chalmers Company, making his headquarters at the "Big Engine" in Machinery Hall. He was the organizer and first vice-president of the Machinery Club and was active in bringing about the organization of the United Exhibitors' Association at the fair. He is a member of the Technical Exhibitors' Association. Mr. Coleman's headquarters are at the main office of the Lidgerwood Mfg. Co., 96 Liberty street, New York, where he will be pleased to receive visits from both business office and editorial representatives of the trade and technical periodicals.

COPPER STATISTICS.

Messrs. James Lewis & Son say in their December report on copper:

"In the United States the scarcity of railroad cars in Montana and a flood in Arizona delays deliveries and the quotation for Lake has advanced ½ cent per lb. and is now 23 to 23¼ cents, or £106 to £107 3s. per ton.

"Our statistics show that the consumption of England during the past eleven months has been only 248 tons more than the average of the same period during the two previous years, while the export of manufactured copper and sulphate is 11,090 tons less. The consumption of France has increased 4,512 tons, and that of foreign copper in Italy, Austria and Russia has decreased 6,530 tons, but in Germany the increase in ten months has been 16,364 tons. The total increased consumption of foreign copper in Europe and of manufactured copper exported from England, is, therefore, only 3,504 tons so far this year, as compared with the average of the same period in 1904 and 1905.

"The United States Geological Survey publishes the following statistics for the year 1905:—

	Tons.
Total domestic production	402,637
Imports	94,073
Exports	246,708
Consumption	259,378

"The increase in the production for 1906 is estimated at about 31,250 tons. Imports will show an increase of approximately 10,000 tons, and exports a decrease of 32,000 tons, making the consumption nearly 333,000 tons —an increase of 28½ per cent. over 1905—assuming there is no change in the stock.

"Stocks in England and France and the 'visible supply' show a considerable increase—840 and 815 tons respectively. The former are now 50 per cent. larger than on the 1st January, when the price of Standard was 35 per cent. lower."

THE COBALT DISTRICT*.

If the visitor to Cobalt expects to find a mining camp, the streets of which are lined with gambling places, dance halls, and saloons, with rough characters carrying belts filled with cartridges, revolvers, and all the accessories of the early Western mining camps, he will be greatly disappointed. It is true that when the discoveries were first made in Cobalt, a few individuals appeared equipped to uphold their rights by the "law of the six-shooters," but in less than a week armament of all kinds disappeared, and the camp took on the orderly, quiet and law-respecting attitude it has ever since maintained. If gambling and drinking exist at all to-day they do so behind closed doors, and the visitor sees nothing to cause him to change his opinion with regard to the orderliness of the district.

The hotels furnish meeting places for all, and deals for property, passed claims, etc., are put through in the quietest manner.

When one remembers that previous to February, 1906, there were no buildings except a few log cabins, the rest of the people living in tents, he is naturally surprised to step from a Pullman car and register at a hotel, heated by steam and lighted by acetylene gas. In the hotels the beaver coat of the capitalist rubs against the "mackinaw" of the prospector and the moccasins and coonskin coat seen so frequently may belong to the man who has sold a claim for a fabulous price.

In all mining camps there exists a varied assemblage of men always searching for the precious metals, and Cobalt is no exception. Mining men from Rossland, Alaska, South Africa, New Zealand, Colorado, Utah, Nevada, California, and every section of the world are there either on their own behalf or in the interests of capitalists. When the rush first started store-keepers, farmers, business men and professional prospectors hurried to the scene and claims were soon staked and applied for. Then began squabbles and litigation over claims, some of which have not been settled to this day. The case concerning the Lawson controversy is very interesting, and will be described in a future issue of the Journal.

*From the Engineering and Mining Journal.

First Mineral Discovery.

The discovery of mineral wealth was primarily due to the advance of the railroad through the country. There seems to be a discrepancy with regard to the first discovery. The McKinley-Darragh people claim that the men laying ties discovered silver in the swamp adjoining the railroad, and on their present property, while others maintain that La Rose, a blacksmith employed by the railway, discovered the precious metal and filed the first claim. La Rose is one of the owners of the famous La Rose Mine, for which, it is rumored, $10,000,000 has been offered and refused.

In other camps the miners are offered every opportunity to spend their hard-earned wages. In Cobalt the men live at the camps, and there is comparatively little opportunity to spend their money. It is the rule for companies to furnish board and lodging in comfortable quarters, and the wages paid include living expenses. The food at the camps is exceedingly good and in abundance. Wages range from $1.75 to $3.50 per day, depending upon the kind of work. Under these conditions the men fare very well. There is always a good demand for men owing to increasing development work in all the mines.

Possibilities of Claims.

The district as a whole is probably the most peculiar ever brought to the notice of mining engineers, investors, and the public. All claims have their element of interest, because, while there may be only enough showing of valuable mineral to warrant passing by the inspector, still no man can state, because of the peculiar conditions existing in this country, that there will be none at depth. This gives the "wild-cat' promoter a chance of which he has promptly availed himself, and the man who may have paid $1,500 for his 20 or 40 acres, will calmly ask from $50,000 to $100,000 for it, and in many cases such prices were paid. The loss or profit to the buyer can only be decided by time and development.

The occurrence of the veins in Coleman township has been likened to the cracks on a dry mud flat. While the general trend seems to be northeast and southwest, still there are strikes having a north-south and also an east-west direction. Veins are liable to swell and pinch, twist and turn, and it is doubtful if there are many in the camp which have shown any marked continuity.

A vein existing strongly in one property may or may not continue in the adjoining claim, as is seen on the Lawson Lot. Here the vein shows up right to the surface at a width of from 6 to 12 in., but when it reaches the Silver Leaf boundary the vein branches out into stringers. To the south it pinches out, and fails to enter the Silver Nugget property so far as is known. And so it is too uncertain for anyone to try to predict or to lay down any rules for the district. Geologists have advanced theories only to have them upset in a short time.

The salvation of the camp is that rich mineral deposits are found in every direction. When we stop to consider that two men with practically no equipment, can work a vein no wider than 0.5 in., and realize more for their labor than they could at any trade, we can obtain some idea of the wealth contained in a vein from 4 to 12 in, in width. It is not uncommon to see rock running as high as 15,000 oz. of silver per ton, but, of course, this is by no means the run of the camp.

Production of the Camp.

A glance at the figures obtained by the Bureau of Mines of Ontario will give a more accurate idea of the actual wealth. In 1904 only 158 tons were shipped from the district. This shipment realized $136,217 or $862 per

ton. The following year returns show 2,144 tons, valued at $1,473,196, or $691 per ton. During the present year (1906) there have been shipped, from Jan. 1 to Sept. 30, 2,305 tons, the value of which was $1,750,000. For October and November no values are available, but the tonnage is a matter of record. During these two months 1,864 tons were shipped to the smelters, and estimating their value according to existing data, we would find that the total shipments from the beginning of the camp to Nov. 30, 1906, amounted to 6,453 tons, valued at $4,700,000, or $729 per ton. This average price includes all ore shipped and does not show the high values of the first-grade ore.

The Nipissing Mines.

During the present time rumor is busy and one hears surprising reports from all quarters. The Nipissing Mine has been made the subject of more rumor than probably any other mine in the district. Since the announcement was made that the Guggenheims had decided to throw over their option reports were circulated that the mine had decreased in value owing to the pinching out of vein No. 49, that this vein had changed into antimony, that in sinking, slate had been encountered, that only thirty men were working on the property, that the title was to be revoked, and that a new attack was to be made on certain claims held by the Nipissing Company. These rumors were circulated by people who either knew nothing of the actual conditions existing at the mine or else were maliciously endeavoring to depress the stock. That this result was accomplished is evident to all. There is no doubt, whatever, that the mine, so far as has been shown, is in a healthy condition, and that values are apparent even to the lay mind. An inspection of the property, during the week ending Dec. 15, showed active mining operations and veins of great richness.

Vein 49, the vein that has been chiefly talked about, has been stripped for a distance of 110 ft., and broken down by underhand stoping to a depth of approximately 25 ft. The work has been done in three steps, and that valuable ore exists is apparent even without assay results. The vein is almost solid argentite, containing native silver and calcite, and the wall rocks contain a workable amount of leaf silver. The width of the vein appears to vary from about 20 in. to 48 in. At the bottom there was exposed a little decomposed calcite, but that the vein has changed materially in character, width or value may be emphatically denied.

There are from 175 to 180 men employed on the property, 75 of whom are on underground operations. A more detailed description of the property will be given in a subsequent issue.

HASTINGS (B.C.) EXPLORATION SYNDICATE, LIMITED.

DIRECTORS' REPORT.

The Directors beg to submit the eighth statement of accounts and balance sheet for the year ended 31st May, 1906. Shareholders will find in the Manager's advices an explanation of the short delay which has occurred on this occasion in the issue of the annual report.

The financial condition of the Company shows—Cash on hand at Bankers, London and Nelson, British Columbia, £3,032 7s. 7d. The administration expenses for the year, in London and British Columbia are substantially the same as those for the previous twelve months, but the cost of development work at the mines during the same period has increased to the extent of £777 17s. 1d., and this was incurred on the Arlington Group.

The ore shipped to the smelters during the year under review realized £10,070 5s. 8d. net, this compares with £10,099 16s. net in 1905. The returns show an increased output, but owing to the lower grade of ore, the average value was nearly $5 per ton less than that for the preceding year, otherwise the result would have been more advantageous.

From the carefully compiled statements furnished by Mr. Leslie Hill, the Company's local manager and consulting engineer in British Columbia, your Directors have extracted the following from the advices of 23rd of August, which they consider will be interesting to Shareholders:—

"Arlington Mine—

"During the year 1,470 feet of development work was done at the Arlington Mine, consisting of drifts 929 feet, crosscuts 47 feet, winzes 44 feet, and raises 450 feet. Of this work 369 feet was done on the 770-foot north level, 14 feet on the 500-foot north level, 101 feet on the head Arlington adit, and 986 feet on the No. 2 Prospect adit. The total cost of this development work was $8,700.37, or an average cost of $5.98 per foot.

"The 770-foot north level was continued for 224 feet, and the No. 2 Prospect adit was driven 428 feet, and these levels were connected by two raises. The vein between the No. 2 Prospect adit and the 770-foot north level formed a sag or roll, and an intermediate level was driven from the second upraise 113 feet north and 88 feet south. The shoots of ore found on the 770-foot north level continue to the intermediate level, and are from 2 to 6 inches thick, and occasionally thicker. In the south intermediate level the porphyry in the vein is distorted and irregular, and the ore is uncertain. The north intermediate drift looked very promising, but the ore became broken up and irregular. It has now widened out and become more solid and regular, there being two seams of ore,—that next the hanging wall being about 18 inches, and that next the porphyry about 30 inches thick.

"Some small seams of ore were met with in the No. 2 Prospect adit, but crosscutting on these failed to disclose any shoots of ore which can be stoped.

"The head Arlington level was driven 62 feet, and crosscuts aggregating 39 feet were driven. The vein is entirely cut off by the fault-plane, and all the ore disclosed has been stoped out.

"The track from the head Arlington adit has been taken up and relaid in the old 365-foot level. Some high grade ore was left in the workings on this level, and I propose to follow this up and take out all ore which will pay for stoping.

"A new ore-bin was built at the No. 2 Prospect adit, and is now being used. An ore bin of three bents and with a capacity of 60 tons was built, together with a high trestle for dumping the waste. The cribbing was built with a view to enlarging the ore-bin, and four more bents will be added this season, making the total capacity about 140 tons. All the ore below the 770-foot level will be brought to this ore-bin.

"The ore shipped during the year was stoped chiefly from the ground below, or to the west of the 770-foot north level. Some ore which had been left in the upper workings was also followed up and stoped out, and now practically all the ore above the 770-foot level is stoped out.

"During the year 1,231.94 tons of ore were shipped to the Hall Mining and Smelting Company, at Nelson, which yielded net smelter returns amounting to $52,352.90, and also a lead bounty amounting to $382.43, was paid by the Government, making the total receipts $52,735.33, or $42.81 per ton. The average value of the ore sent to the smelter was $4.94 per ton less than the average value of the ore shipped during the previous year.

"The cost per ton of ore shipped was as follows:—

Development	$7.14
Stoping	11.08
Sorting and Tramming	4.56
Timbering	.14
Supplies	2.61
General Expenses	2.34
	$27.87

Read at the Ninth Ordinary General Meeting, Dashwood House, London, E.C., Jan. 7, 1907.

"1,370 mine-cars of ore were taken out and 12,327 mine-cars of waste were put on the waste-dump; adding the waste broken and used to fill up the stopes, the average would be 10 tons of waste to one ton of ore, which would make the average cost of the rock mined $2.53 per ton.

"The 770-foot north level has been driven to within a short distance of the boundary line of the Arlington claim. The No. 2 Prospect adit is in the 'Directorate' mineral claim, but if the ore continues it will be advisable to drive the 770-foot north level into and through the ground of the 'Canadian King' mineral claim, and to connect these levels in order to secure a supply of air. For this purpose I have obtained a lease of the latter claim for two years from the 1st of July, 1906, at a royalty of 10 per cent., direct from the 'Canadian King' Consolidated Mining Co.

"The ore body on the north intermediate drift has not been developed sufficiently to form an estimate of the amount of ore exposed, but if it continues to develop in length and width, and of equal thickness, the supply of ore for the coming winter is assured."

In a later letter Mr. Hill advises that the foreman at the mine had informed him the ore was still holding its own, and if anything improving, and says:—

"I delayed sending you the annual report in order to be able to give fuller information in regard to the ore in the north intermediate drift, as the shipments this year will depend principally upon the development of this shoot."

Nothing has been done during the year on any other of the mineral properties owned by the Company, but renewed activity is reported at the "North Star" mine, and there are rumors of a valuable discovery on the "Stemwinder" claim, both of which are adjacent to the Company's properties in the East Kootenay District, and any discoveries made by them are likely favorably to affect this Company's holdings there.

Blairmore Coal Lands.

The payment of the second instalment of the purchase price of these properties, due to the Dominion Government of Canada, has been completed, and all interest paid up to the 1st April, 1906; these absorbed £915 of the Company's funds. It will be necessary to provide a sum of about £1,300 for the third instalment, due in June, 1907, and a like amount for the final payment in 1908.

No satisfactory offers have been received for the properties, but your Directors are taking further steps toward negotiations, which they trust will lead to a satisfactory result.

In accordance with Clause 69 of the Articles of Association, Mr. G. L. Whately retires by rotation from the Board, and being eligible, offers himself for re-election as a Director.

By order of the Board,

E. HOLT,
Secretary.

163-4, Dashwood House,
New Broad Street,
London, E.C.

29th October, 1906.

JAS. HEAD, Chairman.
E. HOLT, Secretary.

Auditors' Certificate.

In accordance with the provisions of the Companies' Act, 1900, we certify that all our requirements as auditors have been complied with.

TINGLE, COMBER & Co.,
Chartered Accountants.

To the shareholders of the Hastings (British Columbia) Exploration Syndicate, Ltd.

Auditors' Report.

We have audited the above balance sheet, and, in our opinion, such balance sheet is properly drawn up so as to exhibit a true and correct view of the company's affairs, as shown by the books of the company.

TINGLE, COMBER & Co.,
Chartered Accountants.

110, Cannon street, London, E.C.,
23rd October, 1906.

GERMAN CONSUMPTION OF COPPER.

Mesrs. L. Vogelstein & Co., 90-96 Wall street, New York, write: We herewith beg to give you the figures of German consumption of foreign copper for the months January to October, 1906, as compared with 1905: — Imports during October, 11,321 tons; exports during October, 946 tons; consumption, 10,375 tons. Imports of copper January to September, 99,230 tons; do. October 11,321 tons. Total 110,551 tons. Exports of copper January to September, 7,890 tons; do. October, 946 tons; total, 8,836 tons. Consumption of copper January to October, 1906, 101,715 tons; do. to October, 1905, 82, 215 tons. Out of the above 9,623 tons of copper were imported from the United States during the month of October.

THE MINING SHARE MARKET.

Messrs. Robert Meredith & Co., 57 St. Francois Xavier street, Montreal, have sent out a circular letter to their clients that contains some most timely information. They say:—

The Cobalt boom has undoubtedly been the most striking feature of the past year, centering on the remarkable advance and as remarkable decline in the price of Nipissing stock. The output of Cobalt for the year has been $2,400,000, and the total capitalization of the Cobalt companies is $250,000,000. The mineralized area, which at the beginning of the year was believed to be only about five square miles in extent, has now been proved to be nearly 100 miles square, and a great deal of development has been done with very good results, particularly in the case of certain privately owned properties, such as the Drummond, La Rose, Jacobs, Hudson Bay, Coniagas, University, etc.

We have advised, and still recommend, great caution and conservatism in dealing in Cobalt stocks. The old mining stock rule, that money paid for Treasury stock should go into the mine, and that not more than fifty per cent. of the total stock issue should go into promoters' hands does not seem to apply to many Cobalt propositions. At the same time, at current prices, some of the Cobalt stocks appear very attractive. The prices, dividends and yields of the principal Cobalt dividend payers are as follows:—

Name.	Capitalization.	Par Share.	Market Value.	Dividend.	Yield.
Nipissing	$6,000,000	$5.00	$14.00	20 p.c.	7.14 p.c.
Trethewey	1,000,000	1.00	1.85	16	9.22
Silver Queen	1,500,000	1.00	1.95	20	10.26
Foster Cobalt	1,000,000	1.00	2.25	8	3.00

Interesting possibilities.

Green Meehan	1.40
Kerr Lake	5.25
Peterson Lake	.48
Red Rock	1.20
Right of Way	7.00
Silver Leaf	.18½
McKinley-Darragh-Savage	1.75

BRITISH COLUMBIA.

The formation of the Consolidated Mining and Smelting Company has put the Rossland Camp on its feet, and the continued prosperity of this mining district seems now assured. The high prices of copper and silver have made all the working mines in British Columbia highly prosperous this year, and Granby, Dominion Copper and B. C. Copper, and a number of smaller properties, have done well. We recommend purchases of Consolidated Mines, Canadian Gold Fields, Dominion and B. C. Copper as investments. The current prices, dividends and earning power of the dividend paying B. C. stocks are as folows:

Name.	Capitalization.	Par Share.	Market Value.	Dividend.	Yield.
Consol. Mines.	$4,698,800	$100	$145	10 p.c.	7 p.c.
Can. Gold Fields.	600,000	.10	.08	7	8.75
Granby	13,363,030	100	135	12	8.89
Domin. Copper	5,000,000	10	7		
B. C. Copper.	2,000,000	10	14		

Canadian Gold Fields is a very attractive stock to small investors. Its dividends are paid from the dividends on its holding of the Consolidated Mines, and its large holding of mineral lands gives it good speculative possibilities. The total production of gold, silver, lead and copper from British Columbia during the year has been $26,000,000, an output that a few years ago would have been regarded as phenomenal.

There has been a renewal of interest in a number of the lower priced B. C. stocks, the demand coming mainly from the West. We look for a decided movement during the present year, and consider the following as being the most attractive:—

	Capitalization.	Par Value.	Market Price.	Value at M'k. Price.
California	$2,500,000	$1.00	.5½c.	$126,250
Monte Cristo	2,500,000	1.00	.2½c.	62,500
Virginia	500,000	1.00	.7½c.	375,000
Novelty	150,000	.10	.3c.	45,000
Ramb'r-Cariboo	1,000,000	1.00	.29c.	290,000

WESTERN COAL.

Several of the Western Coal Companies have come prominently to the front. The stock of the International Coal Company has doubled in value, and a dividend of 1 per cent. a quarter has been declared. A good deal of interest is also taken in Diamond Vale and Alberta Coal and Coke, and we feel inclined to advise purchasers of these stocks, particularly regarding the following:—

	Capital.	Par Value.	Market. Price.	Divi- dend.	Yield.
International Coal.	$3,000,000	$1.00	.66	4 p.c.	5.93 p.c.
Diamond Vale.	3,000,000	1.00	.30		
Alberta	3,500,000	1.00	.27½		

THE CHIBOUGAMAU.

During the year 1906, 200 prospectors made their way into the new Lake Chibougamau Mining District, north of Lake St. John, in the Province of Quebec, and new finds of rich gold, silver and copper ores have been made. The formation of the country, which has been gone into pretty thoroughly, seems to be one, that encourages the belief, that there is a large mineralized area and that quantities of rich minerals, in trace fissure veins, will be discovered. A quartz vein that has been proved to be 1,100 feet in length, from 40 to 80 feet in width, and which at a depth of 34 feet over the whole area of the bottom of the shaft, goes $24 to the ton in fine gold, and 15 p.c. copper, has been opened up on Paint Island, and, together with a large deposit of very fine asbestos in the vicinity, is now the property of the Chibugamoo Gold and Asbestos Mining Company, a close corporation, with a capital stock of $6,000,000. Some other very rich strikes have been made in this district, and assays of $24.00 and of $28.00 to the ton from hand samples of ore, brought from this country, have been obtained. It is confidently expected that before

Parliament adjourns, subsidies that will ensure the building of a railway into this district will be granted. In all our long experience we have never known a more favorable outlook for the future than seems to be presented by these mineral discoveries, and we advise that due attention be given to legitimate mining propositions based upon them.

Yours truly,
R. MEREDITH & CO.

COBALT COMPANIES.

The Toronto Globe of January 3 contained a tabulated statement of all the Cobalt companies incorporated up to the close of 1906. In its introductory discussion of the subject the Globe said:—

Cobalt capitalized arrays itself in ciphers which almost defy comprehension. To talk of Cobalt capitalized is to talk of millions. Ontario has granted incorporation up to date to companies bearing an aggregate capitalization of $171,148,000. Some of the best of the properties represented have been sold to the public at prices double or treble their capitalization. New York, Maine, Arizona and New Jersey have organized and are exploiting mining and exploration companies, and they all talk in millions. The market at present calls upon Cobalt to give returns on an estimated aggregate of $250,000,000. Some of the companies originally incorporated on a modest basis have altered their figures from hundreds of thousands to millions, and the tendency always is towards inflated figures. People who have studied Cobalt at all carefully admit that the potentialities of the camp are great. It has been pronounced by disinterested expert mining men as the greatest silver camp on the globe. It is the great value of the silver deposits there that constitutes the greatest danger for the unthinking public. The exploiting of "wild cat" companies is a consequence. In the matter of investment the Canadian public must be its own best judge.

Some mining companies operating in Ontario under State incorporation have not complied with the Provincial requirements in taking out a license to do business here. Some of these companies assert that they are not legally required to do so, and the Provincial Secretary's Department is now giving the question of the standing of these alien combinations consideration that foreshadows the adoption of some course of action at an early date.

BOOK REVIEWS.

Messrs. Hayden, Stone & Co., 25 Broad street, New York, have issued a pamphlet, "Record of Curb Transactions for the Year 1906," It is worth reading.

"Electrical Wiring and Construction Tables," by H. T. Horstmann and Victor H. Tousley comes in neat pocket size, with round corners. It contains hundreds of easy, up-to-date tables, covering everything on electric wiring. It is published by Frederick J. Drake & Co., 350-352 Wabash avenue, Chicago, at $1.50 net.

"After Earthquake and Fire," has been published by the Mining and Scientific Press of San Francisco. It is a reprint of the articles and editorial comment appearing in that journal following the destruction of San Francisco on April 18th, 1906. Like everything that its talented editor, Mr. T. A. Rickard, pens, those articles and editorials, for which he is responsible, are well written. Several of the other contributions are also worth reading.

Y? is the title of a pamphlet issued by the Canadian Rand Drill Company, of Sherbrooke, P.Q., descriptive of the Little Giant drill which they manufacture. Why are these drills being used exclusively by the Grand Trunk Pacific; in Cobalt; at Niagara; on the C.P.R. track; at Quebec asbestos mines; in the Sudbury nickel district; in British Columbia and elsewhere? For an answer to these questions, you should apply to the before-mentioned company.

The Geological Survey of the State of Ohio has published a bibliography of Ohio geology.

Part 1, contains a subject index of the publications of the Geological Survey of Ohio, from its inception to and including Bulletin 8 of the fourth series, by Allis Greenwood Derby, B.P.H. and B.A.

Part 2, contains a bibliography of the publications relating to the geology of Ohio, other than those of the State Geological Survey by Mary Wilson Prosser.

The annual report of the Department of Indian Affairs for the year ending January 31st, 1906, has been issued. A perusal of this interesting volume shows that the Indians are increasing at the rate of about 2,000 a year; such increase being mostly in the older provinces, and the total gain would have been yet larger had it not been for the terrible mortalities in the Northwest provinces and beyond the treaty limits. There is no doubt that our Indians are gradually adapting themselves to civilized living, and those that have been longest in contact with white men, are, naturally, farthest on the road to safety.

A Compressed Air, issued by the Kobbe Company of 90-92 West Broadway, New York, contains in its issue for December, 1906, an extract of a paper read before the Engineers' Society of Pennsylvania by Mr. Lucius I. Wightman upon compressed air, which contains much information dealing not only with the past history of air compression, but with its present development. Mr. Wightman points out that high pressure compressors are no longer freak machines, unreliable and largely experimental. Increased use of air under high pressure urgently demand a solution of the problems involved, and the pneumatic engineer has been equal to the task.

PERSONALS.

Messrs James and J. K. L. Ross and F. L. Wanklyn have been visiting Cape Breton.

Sir Henry M. Pellatt has been appointed president of the Cobalt Lake Mining Company.

Mr. Rekemer, of H. B. Wills, Toronto, has returned from the Trethewey Mine in Cobalt.

Mr. D. C. Rochester has been appointed managing director of the Cobalt Lake Mining Company.

Mr. P. J. Flynn, of Cobalt, has been visiting Toronto in the interests of the Cobalt Central Mining Company.

Mr. J. W. Osborne, of the Standard Bank, has gone to Cobalt to take charge of the new branch being opened there.

Mr. Henry G. Adler has been appointed general manager of the Foster Cobalt mine in place of "Lucky Scott," resigned.

Mr. J. Eastwood, mine broker, of Toronto, has been visiting Cobalt. He inspected the Green-Meehan, Foster and Silver Leaf properties.

Mr. A. G. Browning, barrister, North Bay, has visited Toronto in connection with Silver Leaf business. He is the president of this company.

Mr. J. H. Stevens, retiring manager of the Silver Queen Mining Company, was given a dinner at North Bay recently, at which one hundred of his friends were present.

Mr. Frank C. Loring has resigned his position as general manager of the Trethewey Silver-Cobalt Mine, Limited, but he will remain with the mine as its consulting engineer.

Mr. H. Mortimer-Lamb, secretary of the Canadian Mining Institute, has been in Toronto arranging for the holding of the annual meeting of the Institute in that city next March.

Mr. Henry Roy, President of the Canadian Ore Refining Company, appeared recently before the Hull Town Council, in regard to the proposed establishment of a refinery at Hull.

Provincial Mineralogist Robertson, of British Columbia, has returned from a long journey through the northern parts of that province. He is very optimistic as to the future of the territory he visited.

Finance Minister Fielding, accompanied by Premier Murray, of Nova Scotia; Hon. Wm. Templeman, Mr. A. C. Ross, M.P. for Cape Breton; and B. F. Pearson, of Halifax, went to Cobalt on Jan. 7, on an inspection tour.

Among recent visitors to Cobalt Camp were Byron E. Walker and E. G. Jemmett, of the Canadian Bank of Commerce. They were accompanied by Mr. Cassels of the Yonge street branch of the bank, and Mr. Walker's son. The party visited the Nipissing, McKinley-Darragh, Buffalo, Jacobs and other prominent mines.

MINING NOTES.

The Imperial Coal Company, operating at Beersville, New Brunswick, are planning to establish a brick-making plant with a capacity of twenty thousand a day. Henry O'Neil, the New York dry goods magnate, is the president of the company.

The striking advances lately made in Canadian Pacific have led to many enquiries as to the reason. It is well-known that the company is making money, and that the ratio of expenses has been declining when there constantly is an increase in the cost of operation on American lines. But this cannot altogether account for the recent heavy investments in Canadian Pacific.

Information leads to the belief that this line has in anticipation a heavy increase in a most profitable form of traffic, and from a reliable authority it was learned that within seven months the road will be hauling iron ore in large quantities from the newly-discovered beds on the south shore of Lake Superior on Thunder Bay, not far from Port Arthur. An expert estimate is that by July next the road will be carrying perhaps 100,000 a month from Port Arthur to Quebec, and double that tonnage by the summer of 1908. What the Canadian Pacific will get out of it is more or less conjectural, but it is thought that it will not be less than $1 a ton.

It is said that the firm of M. A. Hanna & Co., of Cleveland, will handle the ore taken from the Thunder Bay deposits, which fact will tend to give the enterprise a sort of international flavor. Ore shipped to Quebec will be put on to vessels at that port and transported to England, which is ready to receive all it can get. That country now obtains its iron ore from Norway and Sweden and Spain, having none of its own and being compelled to buy abroad.

In return for this ore England will ship coke back to Canada, the all-water route to be taken from Quebec to Thunder Bay, where a huge plant will be erected for the purpose of turning the ore into pig iron. It is the intention, also, to erect a steel plant at Port Arthur.

NEW BRUNSWICK.

Charles N. Crowe, of Nova Scotia, Arthur S. Basker, of London, England; C. J. Coster, J. H. A. L. Fairweather, and H. H. Brittain, of St. John, are applying for incorporation as the Canadian Antimony Co., Ltd., with a capitalization of $250,000, with head offices at Lake George, York County, New Brunswick.

The company proposes to take over from C. Noble Crowe, Mine Manager of North Brookfield, Queens County, Nova Scotia, the option to purchase certain

lands and real estate acquired from the trustees of the Brunswick Antimony Company, and gold mining areas covering said lands, acquired from the Province of New Brunswick, and the option to purchase certain mineral and mining rights other than gold covering said lands, acquired from Mary Matilda McCallum, situate at Lake George, York County, province of New Brunswick, Canada.

ONTARIO.

Another attempt is being made to work the McGown and Willcocks copper mines, near Parry Sound. McKeown & Co., Pittsburg capitalists, have taken an option, and are now at work opening up the mines. A year ago considerable gold and copper was taken out of the McGown mine. The Willcocks mine contains considerable lower grade ore.

Work on the Atikokan Iron Co.'s plant is progressing very satisfactorily. When completed this blast furnace will be of immense value to this section of the country. The Canada Bridge Co., and the Canada Furnace Co. are both entirely through with their contracts and the L. S. Shiner Construction Co., of Cleveland, who have the contract for the installation of the coke ovens and roaster expect to finish up their work in about two weeks. Kelly & Co., of Minneapolis, the contractors for the steam and gas fittings, now have nearly a hundred men employed, the purpose to push their end being that the plant may go into operation next April.

The Larder Lake region is situated 75 miles north of Cobalt, and is within three miles of the Quebec boundary, being ten miles to the east of Temiskaming Railway. Prospectors, and there are dozens of them leaving Cobalt daily, it is asserted, have to cover the ground by means of snowshoes, but when the frost king has loosened up his grip the work of the voyageur will begin.

Starting from Temiskaming Lake he will steer his canoe up the Blanche River to Tomstown and an overland jaunt of six miles will bring him to the shores of Windego Lake, where is a stopping place at which his supply of provisions may be replenished. Continuing his trip up a claim of small lakes he will arrive at his goal after having made ten portages.

The decision of Messrs. J. S. and W. S. Kuhn, the Pittsburg millionaire mine-owners, to spend five millions in exploiting the copper mines of the Parry Sound district, as authoritatively announced lately, has drawn considerable attention to that comparatively new copper country. It is understood that the Kuhns will include the McGowan, Wilcox, and Spider Lake claims, Mr. Thomas A. Wood of Parry Sound, has been busy all summer, making tests, and demonstrating the wonderful value of the copper mines in the Parry Sound District, on behalf of the Kuhns. The opening of the Canadian Northern Railway between Toronto and Parry Sound town, has given a new impetus to the work. Again, the Parry Sounders are projecting a big smelter.

"Folks have been so busy with Cobalt," said a prominent mining man the other day, "that they haven't had time or inclination to investigate the resources of the province, in the matter of copper. With the growing demand for copper wire, and all kinds of copper utilities and utensils, the value of the mineral is soaring. I wouldn't be surprised if we have a big rush to the Parry Sound copper country shortly. Where there are big deposits of copper, it has frequently been shown that gold is also to be found in paying quantities."

Existence of copper in quantities has been known for years, but the difficulties of exploitation were too great for the Canadians. It remained for the Kuhns to see enough in the prospects of the Parry Sound District as a copper producer to put any amount of work and capital in it.

The McGowan mine is 140 acres in extent. From this mine a quantity of bornite or purple copper ore was taken, and the assay was over 60 p.c. copper. Three shafts have been sunk on the McGowan, one on the incline, one straight down 140 feet, and another 300 feet. The Wilcox covers 160 acres and is six miles south of Parry Sound. There are three shafts on the property, 130, 30 and 20 feet deep, respectively. This is a producer of low grade, which assays about five to six per cent. copper. Adjoining to the west is the Spider Lake mine, and it carries practically a continuation of the Wilcox veins. A lot of development work is also taking place in the Moon River country, twelve miles south of Parry Sound.

The shipments forming the output of the silver-cobalt mines of the Cobalt region have recently been issued by the Ontario Bureau of Mines for the nine months ending September 30th last.

The cobalt, nickel and arsenic contents of the shipments are to some extent estimated, since the purchasers of ore in most cases pay nothing for these constituents, and no assays for them are made.

The fact remains, however, that for the nine months there has been shipped 2,542,827 ounces of silver, worth $1,609,554, and in October 1,120 tons additional ore has been shipped. Averaging the price of this 1,120 tons at the same rate as for the 2,305 tons shipped in the preceding nine months it would come close on $800,000, or, say, a total of $2,400,000 in round figures for the ten months of 1906.

The figures for the Cobalt shipments are as follows:

	Quantity.	Value.
Ore mined, tons	3,198	
Ore shipped, tons	2,305	
Silver in ore shipped, ounces	2,542,827	$1,609,554
Cobalt in ore shipped, tons	138	110,400
Nickel in ore shipped, tons	69	16,560
Arsenic in ore shipped, tons	691	13,830
Total for nine months		$1,750,344

The output of other metalliferous mines and works in Ontario, in addition to the Cobalt table, includes chiefly the nickel and copper from Sudbury and the iron ore of the Helen Mines. This is reckoned over again in the manufactured state as pig iron and steel. These items are, of course, increased by imported material.

The return for the nine months ending Sept. 30 follows:

	Quantity.	Value.
Gold, ounces	2,015	$34,377
Silver, ounces	2,542,827	1,609,400
Cobalt, tons	138	110,400
Nickel, tons	8,037	2,856,223
Copper, tons	3,900	600,000
Iron ore, tons	93,159	117,466
Pig iron, tons	208,094	3,194,206
Steel, tons	123,257	3,059,070
Zinc, tons	300	4,500
Arsenic, tons	691	13,830

These figures show a considerable advance over those for the same period of 1905, and indicate that the production for 1906 will be much the largest of any year in the history of metalliferous mining in Ontario.

COBALT.

A carload of silver ore from the West End Mine, now known as Hanson Consolidated Mines, was shipped to Omaha on Dec. 27, from Port Arthur. The car represented $15,000.

Cobalt mining suits are almost as numerous as Cobalt mosquitoes, or Cobalt nuggets—which shows, at least, that the camp is very much alive. There are few suits in "has been" camps.

The directors of the Coniagas Company are issuing a statement to shareholders, reporting progress. This company's output nets a profit of about $100,000 per month, and if this continued, a dividend would be expected in March or April.

The New Liskeard Speaker repeats the denial of the directors of the Clark Standard that they have sold their property to an English syndicate for $500,000. The story arose out of the fact that Messrs. Armstrong and Grills went to Toronto to negotiate a sale, but did not succeed.

Henry G. Adler has been appointed general manager of the Foster mine, to take the position recently filled by "Lucky" Scott. The new general manager was for three months in charge of the University mine. He is regarded as an excellent selection, having had considerable experience in that line in South Africa.

A proclamation from the Ontario Government was issued on Dec. 20, declaring the incorporation of Cobalt as a town. The nominations for the first municipal elections took place on Dec. 31, and the elections on Jan. 7. This action was taken by the Administration in consequence of a petition from the residents of the famous silver camp.

The Nipissing Mines Co. has declared a total of $780,000 in dividends since its organization. In view of the fact that the company in its recent statement asserts that earnings will not be as large over the next three months as they have been since Sept. 1, and the fact that the principal vein, No. 49, has shown a decided decrease in values with depth, it can hardly be said that the quarterly dividend of 3 per cent. and 2 per cent. extra, declared this month was conservative.

On March 31st the Nipissing Mines Co. reported net earnings available for dividends at $600,000, as compared with $794,288 at present, an increase of $194,288. Out of the $794,288 reported, a dividend of 5 per cent., or $300,000, is payable on Jan. 2, leaving a balance of $494,288. Of course this balance will be increased by returns from now until the dividend of 5 per cent. is paid. It would seem, however, that the balance on hand after the payment of 5 per cent. to stockholders will not be much greater than reported nine months ago. As a result of the deterioration of the ore, operating expenses hereafter are more likely to show an increase than a decrease.

A contact of the Huronian with the Keewatin, dipping at an angle of about 25 degrees, occurs on the surface of the Trethewey near the open-cut west of the shaft house. This contact is next encountered in the shaft at a depth of about 60 feet. Predictions had been made that values would cease when the Huronian was reached. These have been shown to be false. The contact has long since been passed, and the shaft right on the vein sunk for a further depth of 60 feet wholly in the Huronian. The width and values of the vein have been steadily maintained. In a few days this contact will be struck again in the drift at the 100 foot level and will be followed from the Huronian into the Keewatin.

The discovery of a large body of low-grade ore at the 12-foot level on the Trethewey is regarded as a matter of importance by mining men. It is claimed that it goes far towards insuring the permanency of the Cobalt camp, and will afford profitable mining for years to come, without regard to the high-grade product which has made Cobalt famous. This low-grade ore will assay from 40 to 100 ounces to the ton, and its average value will be about $30 to the ton. In quantity it is stated that nothing in the Cobalt district that will at all compare with it has as yet been uncovered. Quite a little quantity of native silver is scattered about in this low-grade ore. The discovery is of great importance to Trethewey, which has shipped $500,000 of high-grade material since the property was first worked.

The Cobalt Lake Mining Company was organized in Toronto on December 27. The capitalization is $5,000,000, divided into 5,000,000 one dollar shares. The issue of treasury stock will total 400,000 to 600,000 shares, and these will be taken up by the shareholders, and not issued to the general public. The stock will be listed on the New York, Montreal, and Toronto stock exchanges. It is expected that the over-subscribers will take up all the treasury stock.

The election of directors resulted as follows: Sir H. M. Pellatt, president; George H. Henderson, Ottawa, vice-president; F. Latchford, Ottawa; H. S. Southam, Ottawa; John H. Avery, Detroit; D. B. Rochester, Ottawa; George E. Drummond, Montreal; Thomas Birkett, Ottawa; and Mr. Britton Osler.

A Cobalt despatch says: The Victoria Silver Cobalt Mines, Limited, has made a good strike on its property. It has 29 acres lying south of the Colonial, west of the King Edward, north of the Nova Scotia, and west of the Nipissing, and has been working the property for some weeks. Two shafts have been sunk in two different veins, each to a depth of 20 feet, and the quality of the ore body improves with depth. A large bunk house and cook camp have been built, and 26 men are now steadily employed. Nine veins have been uncovered, and test shafts will be sunk on each. Nickel bloom has been encountered in large quantity from the surface. The find was made a short distance from the Nova Scotia. Cross Lake mines are known to be rich, and veins are being worked on the four properties adjacent to the Victoria, by two steam hoists, a six-drill compressor, and two 60-horse power boilers have been ordered. Charles Giffard, formerly of Spokane, is superintendent; M. E. Deaguere, member of the New York Stock Exchange, is president; G. O. Van Ness, vice-president, and M. O. Gildersleeve, secretary.

The Ontario Government has accepted a tender for a bonus of $178,500, in addition to a royalty of ten per cent. on the gross value of the ores mined, for the unalienated portion of the bed of Kerr Lake, in the Cobalt district, an area of twenty-three acres.

The successful tenderers are Messrs. C. E. Potter, general manager of the City Dairy Company, Toronto, and G. F. Ross, of Montreal, acting on behalf of themselves and a number of other people in both of these cities.

There were six other tenders, their respective amounts being $176,000, $132,000, $122,200, $105,050' $101,000 and $23,000.

The time for receiving tenders, which were accepted at the Lands, Forests and Mines Department, expired at one o'clock January 9.

When the tenders were opened and laid before the Cabinet, the members had no difficulty in deciding as to which should be accepted. All the tenders were devoid of any qualifications, adhering strictly to the form as laid down in the advertisement, being accompanied in every case by a marked cheque for ten per cent. of the amount of the tender.

The purchase of Cobalt Lake by a large and representative syndicate of Canadians for over a million dollars is a good answer to the Guggenheims. The personnel of the syndicate is so numerous that it almost resembles a popular subscription. It shows that Canadian confidence in the big camp is not only unshaken, but stronger than ever, and it will have a good effect. The slump which followed the Guggenheim stock-broking "knock" will be an advantage to both Cobalt and Canadians. It cooled the heads of the unreasoning investors and stock gamblers, and is now giving Canadians an opportunity to get their money up on really good investments at moderate values. Cobalt is just as good, or better, to-day than it was before the Guggenheims heard of it, but the evidence accumulates that there has been a systematic attempt to "bear" it for a purpose. That attempt has in a large measure failed. The latest feature of the campaign is the assertion that the rich surface values cannot possibly go deep. This chestnut has been in circulation ever since the first discovery was made and

has just as much reason behind it as the reverse proposition that the veins will get richer as they go down. There is only one answer to it. The only mine in Cobalt that has a shaft down over 300 feet is the Larose, and stock in the Larose cannot be bought for love or money.—Ottawa Citizen.

Control of the McKinley-Darragh-Savage Mines of Cobalt, Limited, has just passed into the hands of New York capitalists, the deal involving a consideration of $3,750,000, which represents a few shares in excess of 1,250,000, half the authorized issue. The deal is one of the largest to be consummated since the first discovery of silver in the Cobalt district.

McKinley-Darragh-Savage is incorporated under the laws of Ontario at $2,500,000, in shares of $1 each. The officers and directors include F. B. Chapin, president; Thos. W. Finucane, vice-president; W. L. Thompson, treasurer; A. E. Osler, secretary; H. W. Sibley, J. S. Hunn and C. A. Masten. The head office is in Toronto.

The first discovery of silver was made at the Cobalt camp on this property. It was also the first lot to be surveyed. The company owns lot J. B. 1, consisting of 40 acres at the southerly end of Cobalt Lake, four acres being under water. They also own the property of the Savage Cobalt Silver Mining Company, Limited, consisting of 42 acres, acquired some months ago, in the Kerr Lake district. A claim in Bucke is said to be part of the company's holdings also. According to a mining engineer who was interviewed recently the outlook on this property is of an exceptionally high order. His statement is that on the main working the vein has dropped through the conglomerate into the diabase, a volcanic formation, which goes down deeper than it will ever be humanly possibly to mine. This assertion, if well substantiated, is of great importance to the future of the camp. Up to the date of consolidation, the mine has shipped $160,000 worth of ore, and last July the new company shipped its first carload of forty tons. It has been shipping steadily since that time. There is said to be some five hundred tons of low-grade ore on the dump that average 100 ounces to the ton.

The decline in Nipissing shares has been responsible, says the Wall Street Journal, for many erroneous statements as to the treatment of Cobalt ores. It is true that these ores are refractory and difficult to treat, and that it is still an open question as to the best methods of treating them, but these difficulties have not prevented the smelting of the ores. It has, however, prevented the winning of the full values. Cobalt ores run on an average of 40 per cent. arsenic, which is the chief obstacle in their proper treatment. The entire output of the Cobalt camp is now about 30 tons of ore per day. There is probably a loss of $600 per ton in the treatment of the high-grade Cobalt ores in the smelting which naturally comes out of the producer. The smelters make no treatment charge. They buy the ores on the cars at Cobalt, allowing the producer 91 to 95 per cent. of the silver values in the ores. In addition, the shipper pays the freight and the sampling charge. Nine-tenths of all the ore shipped to Jersey City has been going to the Balbach smelter, and the ore has been sampled by Dr. Ladoux. Both shipper and smelter take his assays as final. It is understood that comparatively few shipments have been made to the American Smelting and Refining Co., but when the Guggenheims arranged to take over the Nipissing property they had prepared plans for building a smelter at Perth Amboy to treat the Cobalt ores exclusively.

The leading handler of Cobalt ores is the Canadian Copper Co., which is the operating company of the International Nickel Co. That company has built a smelter at Sudbury, Ont., with a capacity of ten tons per day to treat Cobalt ores exclusively. It has a secret process whereby it saves the cobalt and nickel from the ores. It has been giving better returns to the shippers than the Jersey City smelters, but many of the shippers prefer to ship to Jersey City than to Sudbury. It is apparent that there is sufficient smelter capacity to treat the Cobalt ores now coming on the market, and that while they may be refractory in nature they are so rich in silver values that the producers can afford to stand the heavy losses that now occur in the present method of ore treatment.

According to Mr. Frank C. Loring, consulting engineer of the Trethewey Cobalt Mining Company, it would not be surprising if in 1907 the production of the camp were 20,000,000 ounces or more of silver. Unfortunately the mines receive no settlement for cobalt and nickel; should they do so the returns of the district would largely increase.

During the past season the area upon which ore has been discovered has widened materially, especially to the southeast of Kerr Lake, to the west of Cobalt and in the neighborhood of New Liskeard.

There is no doubt that the silver producing territory in the neighborhood of Cobalt will widen, but that other districts will be discovered in the region of the northeast and west.

Geological conditions at Cobalt repeat themselves many times, and although prospecting, owing to the carpet of underbrush, is difficult, it is only a question of time when there will be many rich mining districts developed in that region.

It has been the impression that all of the veins at Cobalt are simply gash veins and have no great extent either laterally or at depth. Although it is undoubtedly true that some great number of these veins may exist, many of them are limited in their extent and there is no doubt but that there are extensive systems of strong fault fissures, wherein the rich ore is simply an incident, and wherein there also exists other ore of a lower grade, but still of value. These fissures have much greater extent than have the ordinary gash veins, and so long as they exist the extent of the rich ore for a considerable distance, is more certain.

The Cobalt Lake Mining Company, which was organized on Dec. 27, with Sir Henry M. Pellatt as president, was relieved two days later from an injunction by Mr. Justice Mabee restraining the transfer of mining privileges by the trustees of the Cobalt Lake property to the new company. The injuction is dissolved, on the understanding that sufficient capital stock be left in the treasury to satisfy all claims of those who state they subscribed to the syndicate after the books closed. It reads as follows:—

"Upon the defendants, the Cobalt Lake Company, undertaking to retain in the treasury sufficient of the capital stock of the company for distribution among such persons as subscribed to the syndicate or syndicates in question after the closing of the books, if the plaintiff, or such persons is or are able to establish any rights by reason of such subscriptions, without prejudice to the plaintiff proceeding in this action for the recovery of damages for any of the alleged breaches of trust committed by the defendants or any of them, otherwise as the plaintiff may claim, it is ordered that the injunction be dissolved. Costs in the cause, unless otherwise ordered by the trial judge."

BRITISH COLUMBIA.

The Northport smelter resumed operation during the last week of 1906. The intention at Le Roi mine, now that the smelter has resumed operation, is to increase the daily output of ore to about double what it is at present.

The supply of coke is increasing at Trail and during the week ending December 24, another copper furnace was blown in, making three in operation. It is anticipated that soon all of the five copper furnaces will be blown in and then the plant will be reducing 1,700 tons daily.

The smelters of Kootenay are overstocked with ore taken in during the coal strike at Crow's Nest. The Nelson smelter has half a million dollars in stock. The lead mines are negotiating with Everett, Ymir and Laplate, for they have nealy fifteen hundred tons of lead and concentrates.

Everett offers more favorable freight and treatment rates than either the C.P.R. smelter, Trail or Hall mines at Nelson, but now cars are unprocurable. Shipments from Krao, recently purchased by Butte capitalists, will be delayed. A big deal near Nelson will be shut out because American purchasers find themselves unable to ship.

In the shaft of the Grand Prize property located north of Rossland, a find of free gold has been made. One piece of ore is impregnated with free gold in nugget form. The extent of the find has not yet been determined, although the ledge is about four and a half feet in width. By many it is considered important, as it reveals that another section of the Trail coke division promises to develop valuable mines.

Information has been received in Rossland from the east that the officials of the Dominion Copper Company at a meeting held a few days ago in New York, were so well pleased with the work being done at the company's mines at Phoenix and at the smelter at Boundary Falls that it had been decided by the board to enlarge the smelting works with three more furnaces, giving the plant a total capacity of 3,400 tons of ore per day. With two furnaces now in commission and a third now being erected this will make six blast furnaces at this smelter. The improvements will cost in the neighborhood of $150,000 and will be paid for from earnings. It will require the better part of 1907 probably to get the new furnaces installed.

E. A. Ritter, M.E., of Colorado, has returned from Cariboo. He is reported to have said:

"There are 28 different hydraulic mines working in the Cariboo district properly, around Barkerville. I have simply given the salient features of the more important to show that all the mines are working in old pre-glacial channels, different from the river beds of to-day. These channels are very much alike and the characteristics of the layers of sands and gravels, mixed with the big boulders scattered through the lower part of the bank are very uniform. These channels vary in width from 80 feet to 150 feet, and from 50 feet to 150 feet in height. The average values per cubic yard range from 5 cents or 6 cents to 40 cents. Almost all these mines wash from 10,000 to 100,000 yards annually.

"There is only the Hobson mine of the Consolidated Cariboo Hydraulic Company recently bought by the Guggenheim Exploration Company for $1,500,000, which has a very large yardage washed to its credit. But this mine is really in the Quesnel mining division and not in the Cariboo. It has produced over $1,250,000 in the past and is increasing tremendously its water supply, bringing from the railroad two steam shovels to dig ditches 22 miles long and 25 feet wide.

"The different sluice boxes of the various mines are paved with 8-inch riffle blocks; the width of the sluice flumes varies from 18 inches to 3 feet except at the Bear mine, where the two flumes are 4 feet and 6 feet wide, respectively.

"The past experience at the Bear mine is that 95 per cent. of the gold is recovered in the first 150 feet of the flumes. The same result is obtained at the Eight-Mile Lake mine. At the Waverley most of the gold stays in the ground-rock sluice, before reaching the flume and the same is true at China Creek. At the Bear, the Eight-Mile Lake and China Creek mines the gold is not very coarse and varies from fine gold to nuggets worth $5 each. The average size of the nuggets is like a flaxseed; they are from 1½ to 5 cents in value. Stevens' Creek and Waverley recover coarser nuggets. The China Creek mine is the only one to have an undercurrent and this one has proved enough of a success to induce other mines to do likewise.

"There are several old channels not worked now, which promise good returns if properly equipped and managed. It is probable that during the next few years the Cariboo district will see several new mines opened up, equipped and worked successfully."

YUKON.

A Detroit despatch says that negotiations are being closed for the amalgamation of the Detroit-Yukon Mining Co., and the Canadian Klondike Co., with the Guggenheim Exploration Co., which means making them a part of one of the greatest mining syndicates in America. Since the companies were formed five years ago they have been accumulating gold-producing properties in the Canadian Yukon, until they now own 44½ square miles. Enough of exploring has been done to satisfy so eminent an authority as John Hays Hammond, the Guggenheims chief engineer, that the land is exceedingly valuable. The Guggenheim Exploration Co. is a New Jersey corporation, formed in 1899, with $17,000,000 capital, by Morris Guggenheim and his four sons.

COAL NOTES.

NOVA SCOTIA.

Shipments from the collieries of the Cumberland Railway and Coal Company for the month of December were 20,731 tons.

The approximate output of the Dominion Coal Company's mines for December was:—

No. 1	30,774
No. 2	43,203
No. 3	20,808
No. 4	26,768
No. 5	27,246
No. 6	11,998
No. 7	5,729
No. 8	15,406
No. 9	24,777
Total	206,709

The approximate shipments for the same month were 130,968 tons.

The Dominion Iron and Steel Company claims $15,000,000 from the Dominion Coal Company. The sum of $400,000 is claimed for damages to the coke ovens, furnaces, loss of profits and increased cost of production up to 30th of November, 1906. The sum of $68,580 is also claimed for the increased price of coal bought from outside sources, and actually delivered to the Steel Company up to the 30th November, 1906.

In addition to the above claim the Steel Company asks that the value of the ninety year contract to the Steel Company be assessed at the sum of $15,000,000, and that the Coal Company be held liable to the Steel Company in that amount. The total amount of the claim is, therefore, $15,468,580.

The statement of claim of the Steel Company against the Coal Company was delivered on January 8.

THE MINING AND INDUSTRIAL SHARE MARKET.

(Specially reported for the CANADIAN MINING REVIEW by ROBERT MEREDITH & Co., Mining Brokers, 57 St. François Xavier St., Montreal.)

There is more interest being taken in mining stocks than for some time past, and it looks as if an active market in these securities is not far off.

In the western mines the feature is the strength and steady advance of the stocks of coal companies and the buying is chiefly by those at, or near the mines. Nearly all the companies are increasing their output and yet do not seem able to keep up with the demand. Some of the Cobalt companies' shares are coming into this market; the late wild trading in New York has spent itself, the volume is greatly reduced and transactions can be on a more reasonable basis.

Business in the industrial shares is still contracted, and the public appears to be leaving them alone. Prices are

irregular, and do not indicate intrinsic value, or the condition of the business.

The latest quotations are as follows:—

INDUSTRIAL NOTES.

We are in receipt of Mine and Quarry, volume 1, No. 3, which contains some useful papers. One on marble quarrying in Georgia, is lucid and well illustrated; another on Carbons or "'black diamonds," gives a great deal of information as to the mining and marketing of this indispensable material. The reason for the high price of carbon is shown to be the increased demand, with a somewhat diminished production from the Brazilian placers.

Mine and Quarry is issued by the Sullivan Machinery Company, Railway Exchange Bldg., Chicago, Ill., and will be sent to any address upon request.

There is no more flattering endorsement of the excellence of the design and workmanship of a piece of apparatus than repeated orders for it received from a single purchaser. Allis-Chalmers Company's steam turbines and generators, although of comparatively recent introduction in this country, are now being built on the ninth successive order from a single consulting engineer of well-known standing, viz., Mr. Thos. E. Murray, of New York City, who has been instrumental in placing contracts for Allis-Chalmers turbo-generator sets, aggregating 26,000 k.w. in capacity at their normal rating.

The Power and Mining Machinery Company, of Cudahy (suburb of Milwaukee), Wis., in conjunction with The Snow Steam Pump Works of Buffalo, N.Y., has opened a new sales office at 719 White Building, Buffalo, where will be handled the several types of gas generating apparatus, such as the Loomis-Pettibone system, suction and pressure gas plants, built by the Power and Mining Machinery Company, and the Snow Gas engines, built by the Snow Steam Pump Works. Mr. Seward Babbitt, the sales manager of the first named concern, will make his headquarters at the Buffalo office, on account of the facility for conducting business from that point.

Commencing this new year, the firm name of W. H. C. Mussen & Co., railway, mining and contractors' supplies, becomes Mussen's, Limited, a joint stock company.

The change, which makes no difference in the personnel of the company, has been made in order to facilitate the handling of the business.

The company began business in 1901, and the growth has been very steady, until now it is one of the largest supply houses in Canada.

In 1905 a branch office was opened in Toronto, and subsequently in Vancouver and Winnipeg, and this year another branch office will be established in Quebec.

White Jacket Fuse, manufactured by Messrs. Beikford, Smith & Co., Ltd., is their latest invention and is the best fuse now on the market, being superior to the so-called gutta percha, single and double tape fuses. It stands twenty-four hours immersion in water, rough handling and rapid changes of climate and temperature.

The burning speed is very regular, it never runs, neither can the burning stop, as the new and perfected machinery by which it is made make it impossible for fuse to be shipped in which there is a break in the column. It never misses fire.

Messrs. Mussens, Limited, of Montreal, Toronto, Winnipeg and Vancouver are the agents in Canada.

The Canadian Westinghouse Co., Ltd., of Hamilton, Ontario, are distributing a descriptive pamphlet on "Type C Integrating Wattmeters." The returns for your service depend upon the reports of your meters. Westinghouse wattmeters have an unequalled record for accuracy in service and their registration is right at the start and remains right throughout the life of the instrument. The induction motor principle as the basis for its wattmeter design was first adopted by the Westinghouse Electric & Mfg. Company, and it is a significant fact that the original design, with the adoption of such minor changes as years of actual service have demonstrated to be desirable, has remained substantially the same and has so conclusively proved its superiority that its elements have been incorporated in all the successful instruments on the market. The type C wattmeter is the latest and most improved form but its difference from the earlier type is only in degree of development.

The new plant of the Iola Portland Cement Company at Dallas, Texas, is notable for the fact that it will have the largest producer gas power installation in the world. As other plants of the Iola Company, both gas engines and steam engines have been employed, so that in selecting the type of prime mover for their new plant, it was with a knowledge of the capabilities of the respective powers, and their decision was influenced by the saving in fuel consumption that was possible by the adoption of gas for power purposes.

The Loomis-Pettibone gas generating system, built by the Power and Mining Machinery Company, will be furnished in three units having a total capacity of 4,500 H.P. Bituminous coal and Texas lignite will be the fuels used, the Loomis-Pettibone system being adapted to the gasification of either fuel without changes in the apparatus, and the resultant gas is guaranteed to be fixed, clean and suitable for use in gas engines.

The Snow Steam Pump Works, of Buffalo, will furnish for this plant, four of their single-tandem double-acting gas engines, each with a normal capacity of 1,100 B.H.P. These engines will be directly connected to alternating-current 25-cycle electric generators of 819 K.W. capacity each, and will operate in parallel.

Continuous operation, twenty-four hours per day, seven days per week, is required of the power plant.

High efficiency is promised by the builders of the power apparatus, and their guarantees of a kilowatt per hour at the switchboard from 1½ to 1¾ lbs. of bituminous coal or from 2½ lbs. of lignite, when operating at three-quarters to full load, assures the Cement Company of cheap power.

INDUCTION MOTORS.

An admirable example of the application of electricity to mining and manufacturing is at Copper Cliff, Ont. There the enormous plant of the Canadian Copper Company is operated by electricity generated by the Huronian Power Company at Turbine on the Spanish River 25 miles away. Among the different uses to which electric power is now put is to drive blowing engines for facilitating the work of smelting. The illustration shows one of these 70 x 70 x 42 blowing engines driven by a 600 h.p. variable speed induction motor built by Allis-Chalmers-Bullock, Limited, Montreal. Additional induction motors built by the same firm are used for operating air compressors, pumps, cranes and other services in connection with the smelting works.

A 600 h. p. Allis-Chalmers-Bullock Induction Motor driving a Blowing Engine at the Canadian Copper Co.'s Smelter, Copper Cliff, Ont.

THE "IMPERIAL" MOTOR HOIST.

The "Imperial" Motor Hoist, manufactured by the Canadian Rand Drill Co., of Montreal, is designed for use in foundries and machine shops where the handling of flasks and the erection of machinery requires smoothness of action and accuracy of control. Simple in design and operation, moderate in weight and of small outside dimensions, it is especially suitable for shops where head room is limited.

The hoist consists of one of our high pressure, three-cylinder motors geared to a hoisting drum provided with lifting rope and hook. The controlling valve is positive in action and accurately controlled. An exclusive feature is the automatic lock which holds the load in any position without the use of a brake, and prevents it lowering if anything happens to the air supply.

Special attention has been paid to producing a machine which will stand the hardest usage at the hands of unskilled operators, with the least amount of care and attention. The motor is fitted with ground steel working parts throughout, and the transmission gear runs in an oil filled case. These hoists are built in capacities from 1,000 to 10,000 pounds, and are giving splendid satisfaction wherever they are in use. Further particulars and quotations will be given on application to the nearest office of the company.

MINING INCORPORATIONS.

ONTARIO.

Anthony Blum Gold Mines, Ltd. Capital, $100,000, divided into ten thousand shares of ten dollars each. Head office, Toronto. Provisional directors: J. G. Shaw, Joseph Montgomery and James Graham, all of Toronto.

The Old Chap Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: W. H. Francis, F. W. Libbey, R. G. Coan, all of Cobalt.

United Mines of Cobalt, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: C. L. Dunbar, Guelph, Ont.; H. T. Smith and I. S. Fairty, Toronto.

Stellar Silver Cobalt Corporation, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Sudbury, Ont. Provisional directors: J. F. Black, J. H. Morin and Chas. McCrea, all of Sudbury, Ont.

The St. Paul Cobalt Mines Company, Ltd. Capital, $600,000, divided into six hundred thousand shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: A. G. Terrill, S. F. Nelson and Homer Gibson, all of Cobalt.

Keewatin Silver Cobalt Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: J. G. Shaw, J. Montgomery and W. R. Williams, all of Toronto.

The Kerr Lake Lawson Mining Company, Ltd. Capital, $1,500,000, divided into one million five hundred thousand shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: Walter Lawson, of Renfrew, Ont., and Wm. Fred. Powell and Robert Taylor Shillington, of Ottawa, Ont.

The Big Six Silver Cobalt Mines, Ltd. Capital, $1,750,000, divided into one million seven hundred and fifty thousand shares of one dollar each. Provisional directors: W. H. Gates, W. D. Gregory and H. F. Gooderham, all of Toronto, Ont.

Calumet Cobalt Mining Company, Ltd. Capital, $500,000, divided into five hundred thousand shares of one dollar each. Head office, Haileybury, Ont. Provisional directors: James Francis Gillies, Haileybury, Ont.; John McKay, Sault Ste. Marie, Ont., and John Francis Hope McCarthy, Toronto.

Larder Lake Gold Mining Company, Ltd. Capital, $500,000, divided into five hundred thousand shares of one dollar each. Provisional directors: S. Read, the Younger, J. E. Whyte, D. Stewart, S. Greenwood, A. P. Morissette, all of Liskeard, Ont.

Peerless Larder Lake Mines, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto. Provisional directors: F. Hicks, Duluth, Minn.; W. F. Thomson, W. G. Thomson, J. Moffatt and C. B. Jackes, all of Toronto.

Ore Contracting Company, Ltd. Capital, $40,000, divided into four hundred shares of one hundred dollars each. Head office, Bessemer, Ont. Provisional directors: G. W. Wallace, Detroit, Mich.; H. B. Sturtevant, Delevan, Wis.; Frank Pottage, Toronto.

The Cuyahoga Silver Cobalt Mines, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Harry Sydney Pritchard, Frederic Watt and Frederic Clarence Jarvis, all of Toronto.

Anthony Cobalt Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Haileybury, Ont. Provisional directors: R. J. Rowell, W. P. Wilkins, W. J. Quinn, F. W. Bowie and F. A. Day, Haileybury, Ont.

Davis Silver Cobalt Mines, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: G. W. Kenyon, G. A. Stanton, G. G. T. Silsby, of Brooklyn, N.Y.; W. S. Silsby, of New York.

The Gold and Silver Mountain Mine, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: D. H. McAndrew, R. Russell, C. N. Roberts, J. D. McDonald, Thos. Logan, all, of Renfrew, Ont.

The Coniagas Mines, Ltd. Capital, $4,000,000, divided into eight hundred thousand shares of five dollars each. Head office, St. Catharines, Ont. Provisional directors: Henry Smith Osler, John Francis Hope McCarthy and James Miller Ewing, all of Toronto.

Anima-Nipissing Silver Mines, Ltd. Capital, $300,000, divided into three hundred thousand shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: William Black, Sudbury, Ont.; Lewis Elwood Hambly and John Knox Leslie, both of Toronto.

Latchford Silver Mining Company, Ltd. Capital, $100,000, divided into one hundred thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Percival John Montague, Robert Francis Wilks and Francis Pottage, all of Toronto.

Cobalt Silver Mines Company, Ltd. Capital, $1,500,000, divided into one million five hundred thousand shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: Daniel Ford, Walter Tylee Ross, of Montreal, and Phillip O'Reilly, of Ottawa, Ont.

The Jury Copper Mines, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Sault Ste. Marie, Ont. Provisional directors: C. R. Shaw, C. H. Williams, O. B. Jury, S. G. Stone and J. A. McPhail, all of Sault Ste. Marie, Ont.

The Southern Belle Cobalt Silver Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: Thomas Langton the Younger, Michael John O'Neil and John Martin, all of Cobalt.

The Silverado Cobalt Mines, Ltd. Capital, $1,500,000, divided into one million five hundred thousand shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: A. S. Galosha, H. Wallace, P. J. Finlan, H. H. Lang and W. E. Running, all of Cobalt.

Casey Cobalt Silver Mining Company, Ltd. Capital, $1,000,000, divided into one hundred thousand shares of one dollar each. Head office, Haileybury, Ont. Provisional directors: Frank Pottage, George Henry Schakleton and Bessie Mabel Cook, all of Toronto.

The Trout Lake Cobalt Mining Company, of Montreal, Ltd. Capital, $3,000,000, divided into three millions shares of one dollar each. Head office, Ottawa, Ont. Provisional directors: A. C. Brown, B. Burland, J. R. Wright, F. F. Parkins and A. C. Porteous, all of Montreal.

Cobalt Chief Silver Mine, Ltd. Capital, $600,000, divided into six hundred thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: E. L. Bradley, John W. McDonald, Gertrude E. Cherpan, G. J. Valin and Thomas Brown ,all of Toronto.

Nipissing Copper and Silver Company, Ltd. Capital, $3,500,000, divided into three million five hundred thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Fred. Asa Hall, Samuel Hugh Bradford and Solomon Joseph Marshalleck, all of Toronto.

Cobalt Silver Prince, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Cobalt, Ont. Provisional directors: S. D. Maddin, Cobalt, Ont.; D. Crawford and H. Campbell, New Liskeard, Ont.; H. H. Lang, Ottawa; Matthew Finn, Detroit, Mich.

The Lake Abittibi Gold Mining Company, Ltd. Capital, $200,000, divided into two thousand shares of one hundred dollars each. Head office, Toronto, Ont. Provisional directors: John Redmond Meredith, Matthew Crooks Cameron and Robert Stanley Waldie, all of Toronto.

Coleman and Quebec Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Ottawa. Provisional directors: Daniel O'Connor the Younger, Robert Masson, J. Wilson, Adam Tozeland Shillington and J. Ogle Carss, all of Ottawa.

Cobalt Silver Ores, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: James Russell Lovett Starr, James Houston Spence, Lilian Murray Heal, Ida May Duncan and Ida Agnes Rogers, all of Toronto.

Campbell-Crawford Cobalt Silver Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Provisional directors: M. Finn, Detroit, Mich.; D. Crawford and H. Campbell, Liskeard, Ont.; Eustace Craven Bowman, Detroit, H. H. Lang, Cobalt, Ont.

The Dufferin Cobalt Silver Mines Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Ottawa, Ont. Provisional directors: R. A. Helmer, J. E. Hutcheson, Ernest Arthur Larmouth, George Harold Craig and F. H. Honeywell, all of Ottawa.

Northland Mining Company, Ltd. Capital, $250,000, divided into two thousand five hundred shares of one hundred dollars each. Head office, London, Ont. Provisional directors: T. H. Smallman, John Smallman, Geo. Henry Ronalds Harris, and Emilia Archange Harris, all of London.

British American Cobalt Mines, Ltd. Capital, $3,000,000, divided into three million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: John Black, Cobalt; A. G. Fowler Ross, Montreal; Ziba Gallagher, Ethel Maud Wilson and J. S. Booth, all of Toronto.

Cobalt Bullion Mines, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Haileybury, Ont. Provisional directors: A. T. Budd, Haileybury; H. P. Glidden, Cobalt; John MacKay, Renfrew; P. J. Montague and Frank Pottage, both of Toronto.

Penn Cobalt Mining Company, Ltd. Capital, $500,000, divided into five hundred thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: James Edward Day, Edward Vincent O'Sullivan, Mary Donevan, Harry Jewell and James Henry Hallett, all of Toronto.

Banner Cobalt Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Windsor, Ont. Provisional directors: Robert Schulenburg, Merton Lawson Rice, Irving Wesley Green, Warner Raphael Thompson and Timese Lemay, all of Detroit, Mich.

Cobalt Silver Crown, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: John Walter McDonald, Gertrude Eleanor Cherpaw, Richard Stuart Dobbs Hartwick, Eva Lena Bradley and Thomas Brown, all of Toronto.

Pennsylvania Cobalt Silver Mines, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Eugene Van Portway, John George Adair, Emmett Ernest Gallagher, Eugene Coleman Spereman and Jeanette McKinnon, all of Toronto.

The Nepigon Mines Company, Ltd. Capital, $5,000,000, divided into five million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: J. H. Black and John Ferguson, North Bay, Ont.; L. P. Sandbach, Haileybury, Ont.; G. C. Campbell, New York; A. M. Wiley, Port Arthur, Ont.

Cobalt Mining Information Bureau, Ltd. Capital, $40,000, divided into eight hundred shares of fifty dollars each. Head office, Toronto, Ont. Provisional directors: George Fifield Morton, Alexander Hector Beaton, Emmett Ernest Gallagher, Eleanor Jane Potts and Jeanette McKinnon, all of Toronto.

Consolidated Cobalt Mines, Ltd. Capital, $2,000,000, divided into four hundred thousand shares of five dollars each. Head office, Toronto, Ont. Provisional directors: Harper Armstrong, Alexander Fasken, George Herbert Sedgewick, Archibald Thomas Struthers and William Henry Syms, all of Toronto.

Standard Cobalt Mines, Ltd. Capital, $2,000,000, divided into four hundred thousand shares of five dollars each. Head office, Toronto, Ont. Provisional directors: Harper Armstrong, Alexander Fasken, George Herbert Sedgewick, Archibald Thomas Struthers and William Henry Syms, all of Toronto.

Dardanelles (Larder Lake) Gold Mines, Ltd. Capital, $250,000, divided into two hundred and fifty thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Henry Stanyon, Frank Pottage, George Henry Shackleton, Bessie Mabel Cook and Frederick Napier Tennant, all of Toronto.

Freeda Larder Lake Gold Mining Company, Ltd. Capital, $500,000, divided into five hundred thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: James Edward Day, John Michael Ferguson, Edward Vincent O'Sullivan, Arthur Winlow Bixel and Mary Donevan, all of Toronto.

Harris-Maxwell Gold Mining Company, Ltd. Capital, $100,000, divided into one hundred thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Walter Robert Wakefield, Edward Wakefield, Homer Mason, Robert Paterson and Matthew Moore Hulse, all of Toronto Junction, Ont.

The Lumsden Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: John Inkermann MacCraken, Ottawa; Alexander Hector Beaton, Emmett Ernest Gallagher, Eleanor Jane Potts and Jeanette MacKinnon, all of Toronto.

The Esparanza-Cobalt Mines Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Windsor, Ont. Provisional directors: Walter Edward Parker, Frederick Sealy Osborne, Harry Bromfield Bennett, Adams Milton Holden and Benjamin Streeter Warren, all of Detroit, Michigan.

The Brooks Hudson Silver Mining Company, Ltd. Capital, $500,000, divided into five hundred thousand shares of one dollar each. Head office, New Liskeard, Ont. Provisional directors: T. H. Brooks, C. H. Fullerton, John B. Stallwood, Murdoch McLeod, F. W. Haynes, New Liskeard, Ont.; W. G. Otto, Vars, Ont.

The National Cobalt Silver Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Provisional directors: William Gordon, Pembroke, Ont.; John Worthington Smith, Charles James Rattray, Bethune Norman Gordon, Larmouth and Godfrey, Benning Greene the Younger, all of Ottawa.

The Century Silver Mining Company, Ltd. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Sidmoor Sager, George Laws, Alexander Cook Hynd, John Courtland Haskell, Morley Oscar Barnard, Gaius Barrett Rich the Younger and John Andrew Rogers, all of Buffalo, N.Y.

Cobalt Lake Mining Company, Ltd. Capital, $5,000,000, divided into five million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Sir Henry Mill Pellatt, Norman Macrae, Britton Osler, George Charles Loveys, John Francis Hope McCarthy, Hugh Spence, Austin Gregory Ross, Molyneux Lockhart Gordon and James Miller Ewing, all of Toronto.

BRITISH COLUMBIA.

Chemainus Copper Mine Company, Limited. Capital, £200,000, divided into two hundred thousand shares of £1 each.

Old Dominion Copper Development Syndicate Company, Limited. Capital, $35,000, divided into thirty-five thousand shares of one dollar each.

The Bay Gold Mining Company, Limited. Capital, $200,000, divided into two hundred thousand shares of $1 each.

CATALOGUES.

The Sullivan Machinery Company, of Chicago, U.S.A., has issued a booklet descriptive of the Sullivan Air Compressors. It is well illustrated and affords an idea of the scale upon which the Sullivan Machine Company works. A fuller catalogue is also issued. One of these books will be sent on application to the nearest branch office of the company. These are situated at Claremont, N.H.; New York, 42 Broadway; Pittsburg, Pa., Farmers' Bank Building; Knoxville, Tenn., Houston Building; St. Louis, Mo., Missouri Trust Building; Joplin, Mo., corner 4th and Virginia Ave.; Denver, Col., 1748 Broadway; Salt Lake City, Utah, Keith Building; San Francisco, Cal.; Butte, Mont., 48 E. Broadway; El Paso, Texas, 209 St. Louis street; Paris, France, 25 Rue Raffet. Agencies in all mining centres.

We are in receipt of a report of the total output and value by states of the mineral products of the United States in 1905. It was compiled by Mr. Taylor Thorn, and was issued by the Department of the Interior, U. S. Geological Survey, Chas. D. Walcott, director.

Catalogue No. 26, "The Diamond Drill and Its Work," has been issued by the American Diamond Drill Company, P.O. Box 1442, New York, N.Y.

CALENDARS.

The Morris Machine Works of Baldwinsville, New York, have sent out one of the handsomest calendars of the year. It will particularly appeal to all who love horses and dogs.

F. H. Hopkins & Co. have sent to the Mining Review a particularly useful calendar. It is large and very clear; such a calendar, in fact, as every business man wishes to have hanging in his office.

We are in receipt of a calendar from Mussens, Limited, which, in addition to the usual information, carries some convincing illustrations of Bucyrus steam shovels, Vulcan locomotives, "Smith" concrete mixers, and other machinery for which Mussens, Limited, Montreal, are the agents.

There are calendars and calendars. A truly artistic one is generally hard to find, but those that Miss Graham, the head of the Ladies' Business College, 345 Temple Building, Montreal, is sending out, with her compliments, are about as dainty as anything we have seen. They carry a reproduction of a painting by the French artist Langee entitled "Harvest Days."

The B. Greening Wire Co., Ltd., of Hamilton, Ont., have favored us with their annual calendar. They write: "It is the usual design showing portraits of the president and incorporator of the present firm, the founder of the business here and the founder of the present firm in Warrington, England, where the late Benjamin Greening came from to start this business here.

"From the cut of the buildings our friends will see that there has been no growth this year, but from the plans being laid down at the present time there will be considerable increase during the coming year to take care of the increased volume of business that this firm is sharing with the rest of the manufacturers in Canada.

Are the Canadian Winters Too Severe for You?

IF SO

Why Don't You Take a Trip to the Sunny South

BY THE

ELDER, DEMPSTER LINE?

Our next sailing will be the SS. "Sokoto," from Halifax, on the 20th January, for the Bahamas, Cuba and Mexico.

Write for our illustrated booklet, "A Tour to the Bahamas, Cuba and Mexico"; also for particulars of our special 42-day Yachting Trip by the magnificent new R.M.S. "Sokoto," sailing from Halifax, January 20th, and again on March 15th.

For further particulars and to book passage, apply to

NORMAN L. LUSHER, 178 St. James Street, MONTREAL.

W. H. HENRY, Temple Building, MONTREAL.

or to **ELDER, DEMPSTER & CO.,** 319 Board of Trade Building, MONTREAL.

DRUMMOND COAL

The standard of excellence in Bituminous Coal and Coke for Blast Furnaces, Foundries, Manufacturing and Domestic Use.

RELIABLE, UNIFORM and STRICTLY HIGH GRADE

Shipped from Pictou Harbour, Halifax, and all points on Intercolonial Railway and connections by the . . . .

In his speech from the throne His Honour, Lieutenant-Governor Clark of Ontario, made the following reference to Ontario mining:—

The great value of the mineral deposits in the Cobalt district is becoming more and more evident and the future is full of promise both to the investor in mining properties and the people of the Province. The rights of the Province in these deposits have been kept steadily in view by my Ministers, and accordingly a measure providing for the taxation of mining properties will be submitted to you for consideration. I think it well to draw to your attention the fact that a tendency to hasty and reckless investment and speculation is abroad, and, it is to be hoped, will be kept in check by the good sense of our people.

The report of the Berry Creek Mining Company, Limited, of Victoria, B.C., for 1906, has been made public. This mine is situated in Cassiar Mining Division, British Columbia, reached by way of Wrangel, Alaska, and Telegraph Creek, B.C.

This new district was made famous in the '70s by the rush to Cassiar, when Dease, Thibert and McDame Creeks yielded $5,000,000 in placer gold. The British Columbia Mining Company has 10 hydraulic leases, 8,000 acres in all, fronting on Thibert Creek, 1,500 feet. From previous mining operations it had been learned that the average values of the ground since the company came into existence has been about 9¾ cents of gold to the cubic yard, from the top gravel, but when the bottom gravel was washed with the top gravel the average has been about 13 cents a cubic yard.

The conditions of mining at the end of last season's work were considered better than at any previous time. The paystreak shows for 1,100 feet, and it is estimated that there is in sight 400,000 cubic yards of material, having a value of from $50,000 to $55,000.

The most remarkable fact about the Berry Creek deposit is the large values in platinum, osmium and iridium. These have, heretofore, been going to

waste, but it is proposed to employ an expert this year to erect a plant that shall save a large percentage of the metals of the platinum group.

According to the Latchford correspondent of a Toronto paper, it is proposed to give transportation facilities to the new camp that will no doubt be developed this spring upon the Lady Evelyn River, through a line of steamers that is to run from Latchford with certain breaks to Sucker Gut. This would be very nice for Latchford if it should turn out to be feasible.

We have spent the better part of a summer upon these waters, and we are of the opinion that a line of steamers between Latchford and Lady Evelyn will not run for some years, if ever. It is hard work to take a canoe either up, or down, many of the rapids of the Montreal River. There are the Pork Rapids, at the head of Bay Lake, and then Mattawabika Falls, which, although not so high as Niagara, would be too formidable for a steamer to negotiate, and we hardly think it would pay to build locks as suggested, seeing that the river in so many places is hardly deep enough to carry a canoe. The way to take freight into the new camp would seem to be as follows: A line of small steamers at the head of the north-eastern arm of Timagami to Stoney Portage at the north end of the lake. Here a tramway could be installed and a small light draft steamer could carry the freight across Diamond Lake, whence a road or tramway, of about one mile and a half in length, would land cargoes at Lady Evelyn River at the very head of Sucker Gut.

SUMMARY REPORT OF THE GEOLOGICAL SURVEY FOR 1906.

The issue of the Summary Report of the Geological Survey Department for the calendar year 1906 within two weeks of the close of the year is a matter of congratulation to the Hon. Mr. Templeman and to all concerned in the production of the report.

The value of this publication has been greatly enhanced by the insertion of a concise table of contents and an extended index by the use of which any reference to the mass of information contained in the report is easily found.

The report contains the Directors' statements regarding the work and administration of the Department, prominence being given to the efforts being made to increase the efficiency of the department, especially in regard to the early publication of the information collected by the different field parties; and attention is drawn to the great increase in the value of the mineral production of the Dominion during the past twenty years, from $10,221,000 in 1886 to $63,574,000 in 1905. During this period the aids towards mining given by the Dominion government as appropriations to the Geological Survey and the Mines Branch of the Department of the Interior have only increased from $115,055 to $173,555. The necessity of an increase of trained geologists to the staff is pointed out and the best method of procuring such officers is suggested.

A concise statement is given of the progress in the mining industries of the Dominion during 1906 which shows a healthy state of development throughout, owing to the enhanced prices of the metals and to the more economical methods of mining and smelting. The second part of the report deals with the work of the field parties under different officers of the department. These include the following:

Messrs. McConnell, Keele, Maclaren and O'Farrell engaged in the estimation of the value and volume of the Yukon gold-bearing gravels. Mr. Cairnes in examination of the mineral deposits of southern Yukon. Mr. LeRoy on the geology and economic minerals of the southern part of British Columbia along the Pacific coast. Mr. Leach on the important coal and copper areas of the Bulkley Valley, Skeena River. Mr. McConnell on a geological investigation of the Similkameen Valley in southern British Columbia. Messrs. Brock, Young and Boyd on an extensive study of Rossland camp. Mr. Dowling on the northern extension of the valuable coal beds in the Rocky Mountains. Dr. Chalmers and Prof. Macoun on the geology and soil along the line of the Grand Trunk Pacific railway in Saskatchewan and Alberta. Mr. Denis on the coal, oil and gas resources of Alberta and British Columbia. Messrs. McInnes and O'Sullivan on the geology and natural resources of the country on the proposed line of railway to Churchill on Hudson Bay. Mr. Ingall on the copper deposits of eastern Canada. Messrs. Collins and Wilson on portions of the country along the line of the National Transcontinental Railway in northern Ontario and Quebec. Dr. Bell on the Cobalt silver district. Dr. Barlow on the country east of Lake Timiskaming. Messrs. Johnston and Ellis on surveys in New Brunswick, and Messrs. Fletcher and Faribault on surveys in Nova Scotia.

These various reports, all of which are stuffed with facts, and many with information quite lately obtained, are condensed into one hundred and fifty-one pages and should go far to satisfying the mining community of all parts of the Dominion.

OUR CHIEF GEOLOGIST.

It is with much pleasure that we note that one of our best known geologists, a man who has been in the firing line for half a century, Dr. Robert Bell, F.R.S., Chief Geologist of the Canadian Survey, has been awarded the Cullom medal for the year 1906. The medal is given by the American Geographical Society, and this is the first time it

has been awarded to any other than an American citizen.

The prize is a magnificent gold medallion, purchased out of monies left by the late Gen. T. W. Cullom of the United States Army. His will directs that the prize be given annually to such as distinguish themselves by remarkable geographical discoveries, or by their labors in the advancement of geographical science. When of equal merit, citizens of the United States were to have the preference. It speaks well for the honesty and straightforwardness of the Council, that the necessary two-thirds vote was received by a Canadian geologist.

The American Geographical Society's headquarters are in New York. They occupy a very fine and commodious building on 81st street, in which are stored the Society's large and valuable library, collections of maps, charts, etc. The Society was incorporated in 1852, or fifty-five years ago, and it has always been the principal geographical society of the great Republic. It commenced, immediately, the publication of its monthly Journal, the name of which was changed at the end of fifty years to the Bulletin, which is one of the leading geographical periodicals of the world. The Hon. Charles P. Daly, LL.D., Chief Justice of the Court of Common Pleas of New York, and a devoted geographer, was continuously president of the society from 1864 till his death in September, 1899, a period of thirty-five years.

The American Geographical Society, in awarding the Cullom Gold Medal to Dr. Bell, has conferred on him a truly substantial honor, of which he may, indeed, be proud, but this is not the only conspicuous honor for geographical work which came to Dr. Bell in 1906. Earlier in the year, the Patron's Gold Medal, the chief prize of the other great geographical body of the world, namely, the Royal Geographical Society, was awarded to him by the unanimous vote of its council, and with the cordial approval of King Edward, who pays for the medal and also takes a great interest in its award and in the work of the society in general. At one of its meetings which he attended recently, upon the conclusion of the lecture of the evening, he reviewed the subject which had been treated of and moved a vote of thanks to the lecturer.

The Patron's or King's Medal, a beautiful work of art was founded when the society was first established, in 1830. Some of its recipients in the earlier days were Endersley, Burns, Chesney, Carl Ritter, Fitzroy, and later Sir George Nares, for geographical services in various parts of the world. Among those who have won the Patron's Medal for their explorations and surveys in North America were Thos. Simpson, Dr. Rae, Captain Back, John Ross, Captain Palliser, Sir Robert McClure and Sir Leopold McClintock. This medal or other awards of the Royal Geographical Society have been bestowed upon the more noted African explorers, such as Dr. Livingston, Captains Speke, Grant and Burton, Sir Samuel Baker and Sir Henry M. Stanley.

Dr. Bell has been fortunate in his opportunities for making extensive surveys of two kinds, the work having been done for the Government of old Canada, and since 1867 for the Dominion Government. The geographical part was done as being essential to the geological, which was the principal object. It is well known that the former has been much appreciated for many years, wherever geography is studied, but the latter has really been the more important service to Canada from a utilitarian or economic point of view, and it will be found to be of the highest value as the information acquired comes to be more and more needed in the progress of mining and practical geology in the Dominion.

TINSTONE IN CANADA.

Tinstone has at last been discovered in a solid vein in Canada. Samples were received at the end of last month by the Geological Survey from Mr. Harry Piers, curator of the provincial museum, at Halifax, and they proved on being assayed to be cassiterite, the most valuable of tin ores, containing 78 per cent. of tin and 22 per cent. oxygen. The discovery was made by Mr. John Keddy, at Lake Ramsay, on John Reeve's farm, three miles west of New Ross, Lunenburg County, N.S. The ore is found in semi-crystalline forms disseminated through a vein of decomposed, kaolinized pegmatite in granite.

As early as 1868 tin ore is reported by Prof. How to have been found in Nova Scotia in granite at Tangier and Shelburne, and latterly it has also been found in granite drift at Tangier and Country Harbour, and in the tailings at Malaga gold district. Still the granite rocks which form the backbone of the peninsula of Nova Scotia have always been regarded as barren of minerals of economic value by the prospector.

In 1903, Mr. E. R. Faribault, of the Geological Survey, examined geologically the New Ross region, and reported in the Summary Report for that year, the occurrence of ores of molybdenite, zinc, iron, manganese, copper, lead and silver, and other less important minerals, and he recommended the locality as a promising field for prospecting. In the Summary Report for 1906 a reference is again made to the ore-bearing character of the granites of that region and to the rumor of tin ore having been found at Lake Ramsay. Specimens brought then from that locality were examined for tin, but they only proved to be zinc blende, a mineral which much resembles cassiterite. The vein has only been opened 12 feet in depth and it requires to be developed considerably more to prove the economic value of the deposits. Still the fact is established that the granites of Nova Scotia contain valuable minerals, and chief amongst them is tinstone. More

exploratory work should be done in that region by panning for tinstone along the streams and developing the numerous pegmatite veins which cut the granite. In the reports of the Geological Survey tin ore is reported to have been found in drift at several places in Canada. It was found in New Brunswick on the Pokiok river, York county; in Quebec, on the sixth lot of the eleventh range of Whitton, Compton county; and in the gneiss of Buckingham, Labelle county; in Ontario in minute quantity at Sudbury, and the Vermillion mine, in the county of Denison, district of Algoma; in British Columbia in a three feet vein of pegmatite cutting granite near Osoyoos lake, also in Cariboo and Boundary Creek districts; and in the Yukon in several tributaries of the Klondike river, but so far, most frequently in Bonanza, Hunker and Sulphur creeks, where it occurs as stream tin in smooth rounded pebbles up to two inches in diameter, which remain with the gold in the sluice boxes, on account of their weight. The discovery of tinstone in the Laurentian rocks of Greenland constitutes a claim to attention in the fundamental strata of Baffinland where commercially valuable deposits may be expected.

Tinstone is a rare mineral all the world over, and has been found in paying quantities only in very few places, and generally in pegmatite veins in the granite. The world's output of tin in 1905 was 92,607 tons, produced by only six localities: the Malay peninsula producing 58,547 tons, or 60 per cent. of the whole. Bolivia, 12,500 tons, Billiton and Banka Islands in the Dutch East Indies, 12,615; Australia, 5,028, and England, 3,857 tons. In the United States tin ore was found in several states, including Maine, New Hampshire and Massachusetts, where it occurs in granite much similar to that of Nova Scotia, but not in paying quantities. No tin was produced in the United States before 1903; in that year nineteen tons of high grade concentrates were extracted from South Carolina and shipped to England; in 1904 about 142 tons of concentrates from South Carolina, South Dakota and Alaska were shipped to England, but no production is reported for 1905.

The price of tin has increased greatly during the last few years, and as the demand is greater than the supply it will certainly keep on increasing. In 1905 the price per pound increased from twenty-nine cents to thirty-five cents; in April, 1906, it reached 38.6 cents, and at present it is forty-two cents. The high price of tin is naturally stimulating developments in all parts of the world, especially in Australia and Bolivia. The cost of production has increased in the Malay peninsula on account of the exhaustion of the richer and more easily worked alluvial deposits, and also on account of the rise in wages.

Mr. Faribault will be in Nova Scotia again next summer to complete the geological survey of the gold-bearing and granite rocks lying to the west of Halifax in Lunenburg County, and will devote some time to a study of the mode of occurrence of the mineral veins at New Ross, so as to assist if possible in the development of this promising new district.

THE SOUTHERN YUKON.

Until recently it has been generally supposed that the mineral wealth of the Yukon existed entirely in its placer deposits, and as these are mostly in the northern part of the territory, the southern part was considered of little value. The days of the individual placer miners appears to be almost a thing of the past, as none of the fabulously rich deposits such as caused the early Klondike excitements have recently been found, and the work of washing the sands and gravels is now chiefly carried on by large concerns, so the life of the Yukon, to some, appeared to be measured by the life of the gold sands to the north. However, quartz mining has recently become of such importance and promise as to practically dispel this former idea.

To reach this country the usual route is to go by boat from Vancouver or Seattle to Skagway, Alaska, a distance of about 865 or 1,000 miles, respectively, thence via the W. P. and Y. Railway to Whitehorse, Yukon, a distance of 111 miles. From here steamers run down the river to Dawson, about 460 miles.

A few years ago a number of copper claims were staked just west of Whitehorse and some very encouraging development work was accomplished, but for a number of reasons the camp has been, until this last season, practically at a standstill. A few trial shipments of about ten tons of ore were made. Three such samples from the Copper King gave returns of 46 per cent., 31 per cent. and 29 per cent. copper, and there appears to be plenty such ore. This last season, Byron N. White, of Spokane, commenced work on the "Pueblo" and by surface stripping uncovered a body of almost solid ore about 270 by 250 feet, and a shaft was sunk in one place over 100 feet, and neither wall had at this time yet been found. The ore is hematite iron strongly impregnated with copper. The whole deposit seen would average at least 4 per cent. copper, and carries some gold values, and by hand sorting very high grade shipments could be made. The contact along which the copper properties are located can be traced over fourteen miles, and is mineralized throughout the entire distance.

With this exception no quartz mining, except a few assessments done by prospectors in different places, had been done in this southern Yukon until about a year ago this last summer, when Col. J. H. Conrad commenced work on a number of properties in the Windy Arm district, which is along the railway, and about forty miles south of Whitehorse.

Since then considerable development work has been done on a number of properties both by the Conrad Consolidated and the Anglo-American companies. The ores consist chiefly of high grade silver minerals and gold in quartz veins, which are in true fissures, and vary from a few inches in width to over twenty feet. Argentiferous galena is the chief mineral, often associated with rich silver minerals, such as argentite, ruby silver, and stephtanite, and accompanied by pyrite and arsenopyrite.

The Conrad Consolidated has three Riblet aerial tramways in operation for carrying the ores of the different properties to the shores of Windy Arm, the longest being 18,697 feet in length, with its upper terminal 3,469 feet above the lower, cost over $90,000 to install. The others are much shorter.

Some shipments of ore have been made, but these were mostly trial shipments. The properties are as yet in the prospect stage, but for the amount of work done look very promising.

The success of the Windy Arm properties encouraged prospectors to prospect more carefully this season, with the result that a number of valuable finds have been made. About the middle of June quartz carrying free gold and telluride minerals was found between the Watson and Wheaton rivers, about eighteen miles southwest of Robinson Siding. These quart veins were traced in a belt about two miles wide for about twenty miles in a southeasterly direction, and, over seven hundred locations were made. The quartz is quite well mineralized in places, carrying gold and silver values chiefly. However, no work has been done as yet to see what values the veins really carry. The telluride ores from the original discovery on Gold Hill assayed into thousands of dollars per ton, but only a small amount of this was found. The average surface assays which were made in the district were, however, encouraging.

A large body of stibnite carrying mercury was also discovered towards the end of the season, to the west of the other properties.

So considering that there were only a few men in the country and these were only prospecting a very short time, the results go to show over what wide areas the valuable ore deposits of the Yukon are distributed.

Added to this there is plenty of coal in the district. Quite an extensive basin of anthracite coal lies just to the south of the Whitehorse copper deposits, and is easily accessible from the railway. Also coal is being mined down the river north from Whitehorse in different places, and will probably be found much closer to Whitehorse. The samples taken from Tantalus and Five Fingers mines gives in the laboratory a good firm coherent coke. So that a smelter at Whitehorse, to treat the copper ores there, is one of the probabilities in the very near future, as there is plenty of water power in the vicinity.

OUR MINING INDUSTRY IN 1906.

The Director of the Geological Survey has introduced into his summary report for 1906 a new feature which will appeal to all those interested in the mining industry of this country. In a few words he sums up the principal items of the mineral production and shows that the mining industry has never yet been in so healthy a condition. He writes, "It can be said without fear of exaggeration that the condition of the mining industry in Canada in 1906 has been one of large prosperity, that it has, in fact, achieved greater progress and given bigger returns than during any previous year on record. In the year 1905 the total mineral output reached almost $70,000,000, as compared with but a little over $60,000,000 in 1904, and while actual figures of production are not yet available for 1906, the activity evidenced in both the metalliferous and non-metalliferous mining will, no doubt, result in another large increase being shown. There has been during the year an active demand for nearly all mining products, and the higher prices realized, especially for the metals and their ores, has not only helped to increase the actual output, but have stimulated development and prospecting throughout the country.

Metallic.—The increase in prices of metals during 1906 is distinctly shown by the following quotations. The average price of the metals for 1905 was as follows: Silver, 60.35 cents per ounce; copper, 15.59 cents per pound; lead, 4.7 cents per pound; spelter, 5.82 cents per pound; nickel, 40 cents per pound. During 1906 the prices of all these metals had increased, and in December, 1906, the quotations were as follows: Silver over 70 cents per ounce; copper, over 22 cents per pound; lead, 5.75 cents per pound; spelter, 6.4 cents per pound; and nickel from 45 to 50 cents per pound.

Nickel.—The nickel-copper mines at Sudbury have been actively worked throughout the year and will show an increased output. Electric power has been introduced and the general efficiency of the works greatly improved.

Copper.—The actual output of copper in eastern Canada, outside of the metal obtained from the nickel ores above mentioned, is comparatively small, but a great deal of work has been done during the year in the exploration and development of copper properties.

British Columbia is now Canada's great copper-producing province and more particularly the great bodies of low grade, but easily mined, ores of the Boundary district. The shipments from this district during ten months of 1906 are estimated at close on a million tons or greater than the total output of 1905. The smelting capacity of three furnaces in the district was considerably increased during the year. Dividends were declared by one company aggregating $1,215,000.

The copper mines of the Coast district in this province have been actively worked during the year,

as were also in the ores of the Rossland district, which are further mentioned under the heading "Gold."

Gold.—The gold output in Canada has been showing a yearly decrease since 1900 due to a regular falling off in the Yukon placer production, and this decrease has, in all probability, continued in 1906. In eastern Canada the output has never been large, but Nova Scotia seems to make a better showing in 1906 than in the immediately preceding years. In British Columbia the gold production has shown a slow but steady increase which has to some extent counterbalanced the decrease in the Yukon output. In Rossland an important amalgamation of interests took place in the early part of the year. The War Eagle and Centre Star mines, the smelting works of Trail, with the St. Eugene silver-lead mines of East Kootenay, and other interests, were united under one management known as the Consolidated Mining and Smelting Company of Canada. The consolidation is one which will, no doubt, tend to much greater stability in the mining industry.

The discovery of new ore shoots in the Centre Star and other mines, the payment of dividends by the Le Roi, the Le Roi No. 2, and the Consolidated Mining and Smelting Company, and the encouraging detailed geological work done by the Geological Survey under Mr. Brock, have all tended to put new life into the district and a bright future is looked forward to. The total ore shipments for 1906 may possibly not exceed or even equal those of 1905 owing to the unfortunate strike of coal miners at Fernie having caused the smelters to close down for some months in the latter part of the year for want of coke.

In Cariboo several properties, including that of the celebrated Consolidated Cariboo Hydraulic Mining Company, were acquired by the Guggenheim Exploration Company, and a large investment of capital is being made in the construction of many miles of new ditches, which will supply a more regular and larger supply of water for the working of the huge areas of gold-bearing gravels this company possesses.

The Atlin placer deposits were worked about as usual, although a shortage of water had to be contended with.

The gold output of the Yukon will again apparently show a decrease. Official figures are not yet available, but from current reports apparently not more than $6,000,000 is to be expected this year. In this district the large corporations are absorbing the smaller operators and the Guggenheim Exploration Company under the name of the Yukon Consolidated Gold Fields Company has entered the field buying up numerous claims. The company has already commenced the construction of ditches and flumes to provide water for operating their claims. Other large work are to be undertaken, such as the construction of reservoirs, a power plant, etc., and altogether a large number of men will be employed this winter.

Iron.—The iron industry has been active throughout the year, a good demand for all classes of iron products having been experienced and the iron furnaces have been operated probably more extensively than ever before. A new furnace plant is in course of erection at Port Arthur intended to utilize the ores of the Atikokan areas. The output of pig is likely to be larger than in 1905, and would probably have been still greater but for an unfortunate dispute between the Dominion Iron and Steel Company and the Dominion Coal Company in November regarding their coal contract.

Lead and Silver.—The argentiferous galenas of the Kootenay districts are again being worked on a large scale, the East Kootenay mines, St. Eugene and others, being large shippers during 1906.

The Cobalt district of Ontario has attracted world wide attention during the year and is rapidly becoming an important silver producing district.

Zinc.—The concentrating of zinc ores in British Columbia has continued with considerable success. The large zinc smelter at Frank, Alta., was sufficiently advanced for the first metal to be turned out in June. It is understood, however, that some further changes and improvements were found necessary before regular smelting could be undertaken.

Non-metallic.—Amongst the non-metallic class of minerals mined in Canada, the more important are mica, chromite, coal, corundum, gypsum, mica natural gas, petroleum and salt, besides the structural materials including the clay products, stone and lime and cement. The mining of all these products and others of lesser importance has actively progressed during the year. The coal mining industry especially has made good progress in the various fields exploited, Nova Scotia, Alberta and Saskatchewan and the Crowsnest Pass and Vancouver Island fields of British Columbia. In Alberta a rapidly growing population has created such a demand for coal that new mines are yearly opened up and a much larger output made. Nearly one-half the coal mined at the Crowsnest Pass is converted into coke to supply the rapidly growing demands of the smelting industry in British Columbia and for export. Labor difficulties have interfered to some extent with the operations at Fernie and at Lethbridge, the latter causing a shortage of coal at certain points in Saskatchewan which threatened to become serious. These difficulties have, however, been happily settled before the close of the year and no doubt in time to avoid any further serious trouble.

The asbestos mining in the eastern townships of Quebec has been particularly active during the year, prices have been good and a large increase in mill capacity to handle the mineral is contemplated.

The chromite ores of this district have also been mined about as usual.

Gypsum mining in Nova Scotia and New Brunswick and to a lesser extent in Ontario and in Manitoba has been carried on with increased output. Higher prices have also been obtained in this industry.

The corundum of Ontario finds a ready market; mica has been in good demand and at higher prices, while natural gas, petroleum and salt industries of the Ontario peninsula have been worked as usual.

In the structural material class the production of clay products such as bricks, tiles, etc., stone and lime, has to keep pace with the growth of the population. The increased use of cement in all kinds of structural work such as buildings, sidewalks, and roadwork, bridges and monolithic work, etc., has caused a great demand for this product and a largely increased output is being made.

CONCENTRATION.*

Since the world became highly civilized, there have been eras, or ages, when some one great industry has flourished to a much greater extent than the rest during that period, such conditions lasting, perhaps, for several decades and even centuries. The present age might appropriately be called the age of mining. At no previous time in the history of the world has the mining industry taken such a strong hold on the people as at present. Mining in nearly every civilized country has forged to the front with great rapidity. New discoveries are being made every day, and new concentration, or reduction, plants installed.

Canada, as we are all convinced now, is a country of great mining possibilities. Events are transpiring from day to day which demonstrate, as Dr. Adams has pointed out, that we have scratched or prospected only a very small percentage of the great territory allotted to us for exploration, and that we may reasonably expect such great and almost bewildering discoveries, as the world has never yet witnessed. But, right here, another aspect of the subject presents itself, and this may be best put into the form of the following questions. Are we aware that many ore deposits, of various natures, whose existence has been known to us for years, have not been developed, nor has there been any attempt made to make them economically useful? Do we realize that with the progress of technical science we are able, to-day, to treat ores more successfully than ten or twenty years ago? That we now can make mines pay, which could not be put on a paying basis years ago, on account of the lack of knowledge of proper methods of treatment?

Gentlemen, it would appear from these questions that I find fault with the craving of the general public for something new, before they have taken advantage, fully, of these dormant things lying at our threshold waiting utilization! No; far from it. New mineral discoveries are needed to draw the attention of foreigners, and of foreign capital to this country—Canada in the first place needs a denser population, and, so far as I can judge, we need more foreign capital with which to develop our resources. But it often happens, that just such capital, originally intended for investment in new discoveries, has, for some reason or another, been applied to the development of mineral resources of this country, known for some time, but which on account of expensive methods of separation could not in the past be made to pay.

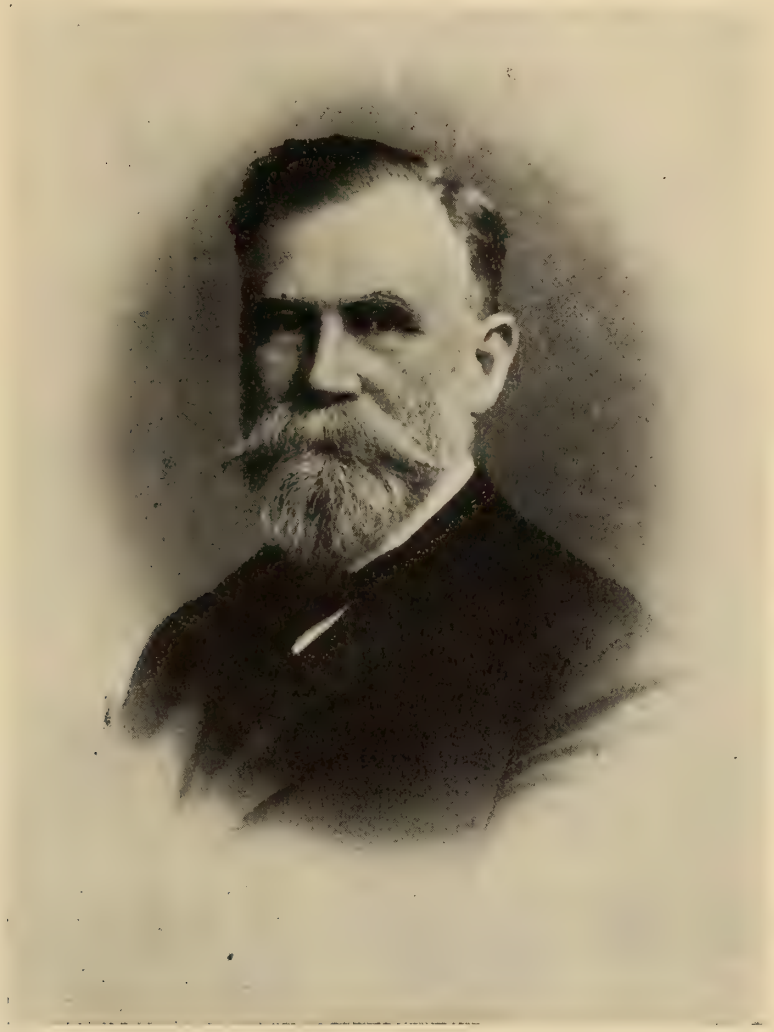
Here then, logically, another question arises: What constitutes the success of a mine? What are the essential factors which make up the successful mining venture? Gentlemen, to answer this question would require a long dissertation on a subject which lies beyond the scope of this paper. First and foremost, there is required a study of the geology of the ore deposits—a branch of science which has been greatly developed during recent years. To cite only one example of how this enters into practice; it may be remarked that thousands of dollars expended in the fruitless prospecting of twenty years ago, would have been saved, if there had then been the knowledge of secondary enrichment that there is to-day. Next comes the matter of the tonnage, and in the case of metalliferous ores, the assay of the ore developed. Of great importance are the conditions governing the extraction of the ore, and the cost of mining. And last, but not least, the question of the treatment of the ore—its economic separation from the accompanying gangue material. It is upon this latter subject that I should like to say a few words to you, gentlemen, especially to the younger members of my audience, and I feel confident that you, after careful consideration, will find my remarks, based as they are on personal observation in the field, to be not far from the mark.

The mining engineer of to-day requires not only a broad knowledge of the geological conditions which govern the mineral deposits, not only a knowledge of the ways and means of getting out the ore, but he requires also a deep knowledge of the problems of separation. How many mines have been doomed to failure through the absence of just such knowledge? The profession of mining engineering presupposes, nowadays, a very broad knowledge of the principles which govern modern ore separation. Twenty years ago we may say that ore separation was simply in its infancy; a time when it was believed that simply cobbing the ore, or putting it through a crusher and treating it by the wet process, was perhaps enough for so-called rough treatment, and when no further utilization of the residue was deemed necessary. But, to-day, with the great advance in technical science, with progress in all branches of industry, these old processes are found insufficient, and to our great

* Address delivered before the Mining Society of McGill University by Mr. Fritz Cirkel, M.E., Montreal.

satisfaction we find that mining engineers have not been idle in extending and improving the processes in vogue, in fact, old-fashioned separation methods have been succeeded by others that make it possible for a mine to pay dividends which could not have been worked at a profit by old methods.

But, gentlemen, we must not stop here. We must not think there has been such progress that we may now treat all kinds of ore with success. On the contrary, new ores of complex composition, are found each day, and which require special treatment, though the principles involved may be in all cases identical.



Take gold, for instance, We all know that some twenty years ago the only way of extracting gold from its matrix was by the well known amalgamation process, which was, with here and there slight variations, applied to all free milling gold ores. We remember, also, that twenty years ago great excitement was caused by the invention of the cyanide process. Now, from the success this process has attained treating Transvaal ores, as well as those of California, it would seem that nearly all gold ores could be amenable to this process with slight variations. But this we know is not the case. A further development was registered by the application of the Pellatin-Clerici process, an electric process, for which it was claimed, that all gold occurring even in a very fine state of division could be extracted. Yet, although this process was successfully applied to a number of ores, still there are gold ores which do not seem to be attacked successfully by any process in vogue. I have a case in mind, where ores which contain the gold in a very fine state of division, were treated with this process, and the result was that fully 45 per cent. of all the gold was lost. Another case, which will illustrate the necessity of continuous experimentation with one's ore, is one which came under my attention some eight years ago, in the State of Washington. This mine when I made the examination, had, approximately, 100,000 tons of gold ore in sight, averaging eleven dollars in gold to the ton. A mill was built for the treatment of the ore at an expense of $60,000, but, although great efforts were made to bring the enterprise to a successful issue, it was doomed to failure, owing to the impossibility of getting a satisfactory extraction of the values. This mine, although having a very large tonnage of ore in sight, has been lying idle ever since. Here, gentlemen, is an example of a case where ingenuity can make its mark; here is a case which demonstrates that we have not yet solved the problem of gold extraction in all cases, and it is for the engineer, and for the chemist to work hand in hand for the discovery of such treatment as may deal with ores in which the gold is in an extremely fine state of division. Here, is a case where a fortune awaits the engineer or chemist, who will solve an intricate problem of gold extraction.

I will deal, now, with another ore, which is the mainstay, the backbone and foundation of the wealth of a nation; iron. You know that we find iron deposits through the Laurentian formation. A number of deposits were worked some thirty or forty years ago, and although the mines offered great inducements as regards tonnage in sight, the operations were not successful. What was the cause? Was it the composition of the ore, which prevented it from being used successfully in the furnace? No, it was, simply, the lack of proper separation of the ore from the gangue. But it is with satisfaction we find that since that time processes have been invented which facilitate the concentration and handling of such ores. Magnetic ores, in nearly all cases, are more or less mixed with the rock of the containing formation, and it would be an immense task to separate the ore from the gangue by hand. However, magnetic concentration comes to our aid, and ores which have only a percentage of 23 per cent. can be made use of by concentration. I may add that in the great concentration plants in the Adirondacks, magnetic concentration is in vogue, and the mines, through this process alone, have been made an unqualified success, and put on a paying basis.

From an examination of the iron ore deposits in Ottawa County, I am convinced that our magnetic mines can be put on a paying basis, by just such a system of magnetic concentration, and it is not unlikely that an American firm, which has been conducting diamond drill operations in some of the mines, will put up a large concentration plant, and work the mines to their full capacity.

From what I have said, gentlemen, you may easily infer that here is another case, where there is sufficient ore in sight, but where there has been no mechanical means whereby the ore might be treated, so that it was acceptable to the market. John Stuart Mill says: "To draw inferences is the great business of life."

I may quote another example of my meaning—asbestos. You know that Canada supplies the whole world with asbestos, but this would not be so were it not for the processes of separation which have been invented to extract the fibre from the gangue. The history of this mineral makes interesting reading. Mining operations in the Eastern Townships of Quebec commenced on a small scale in 1878, and in that year 50 tons were taken out for which, however, it was difficult to find a market. The quality of the fibre was excellent, and the width of the veins was everything that could be desired, from 1 inch up to 2, 3 and sometimes 4 inches. This justified the expectation that large deposits of the mineral might exist in that locality, though their true importance and value were not ascertained until several years later. Shipments of the better grades made to London created quite a sensation in the market; extensive tests and investigations were

DR. ROBERT BELL, F.R.S.,
Chief Geologist.

made, and the result was that the high value of this mineral on account of its exceptional qualities for spinning purposes was soon established, and the race for the acquisition of additional areas likely to contain the valuable mineral began. The land was considered practically of very little value for agricultural or any other purpose, and mining operations were rapidly extended.

For the next ten years we witness a rapid development of the industry. The mines are worked on a large scale, while the prospector is still busy exploring for the mineral in the surrounding mountains. Villages spring up like mushrooms, in a country which is physically speaking, one of the roughest. The population, comprising before the begining of mining operations, only a few scattered families, increases to several thousands, and the whole country shows all the evidences of industrial activity and prosperity.

But it was soon discovered that the primitive methods of hand extraction were faulty, inadequate and expensive, especially as far as the lower grades were concerned. As a matter of fact, under prevailing price conditions, only those mines which were working on richer ground, and had a large percentage of crude asbestos, had a chance to live and carry on operations with a profit. The natural outcome of this condition was obvious; many mines producing only a very small percentage of the higher grades were forced to shut down, and this, together with serious difficulties accentuated by overproduction and a consequent fall in prices, caused the industry to receive a severe set back in the middle of the nineties. For some years the industry languished, all retiring save those who would not be discouraged, no matter what should happen.

However, the mechanical ingenuity of those engaged in the mines, and of those having the development of the industry at heart, came to the rescue; handcobbing of the lower classes of asbestos gave way gradually to mechanical treatment, and this method, in the course of years, was so successfully and effectively worked out that, to-day, we find every mine in the district with a complete milling and fiberizing plant. By this process, all the smaller fibre, which in the earlier years was left in the rock, and thrown on the dump, is saved, and as new uses for this short material sprang up, the life of a mine was prolonged and its management attended with less difficulty.

As a result of these innovations, 16 mills with a capacity of 3,500 tons of asbestos rock per day, are operating in the district, and if reports prove true, the capacity of the mines and mills will be largely increased during the present year.

The asbestos industry is a striking example of what human ingenuity, if applied in the right direction, may accomplish. It demonstrates that, in order to atttain success, it is necessary "To strive, to seek, to find and not to yield."

The asbestos mines of the Eastern Townships constitute one of the most prosperous industries of the Dominion of Canada, and they are of special interest to the mining and industrial world, from the fact that, in so far as now known, they represent practically the only deposits where this mineral of a quality adapted for spinning and for the finer purposes of manufacture can be mined with a profit. So great are the advantages which these mines possess, particularly as regards accessibility and the ease with which the extraction of the fibre is now accomplished in the mills that, unless fields as yet unknown and as easy of access can be discovered, the Province of Quebec will long enjoy the privilege of being the principal source of supply of asbestos, not only of the North American continent, but of the world.

I have another case in mind; graphite. Canada has been known for over 50 years to possess rich deposits of this mineral in the Laurentian formation. But what have we to show in the way of a graphite industry, in the way of development of our mines, or of concentration plants? Surely, not much up to this time. The statistics tell us the yearly production amounts to only a few thousand dollars. But there seems to be to-day a better appreciation of our graphite resources, especially by foreigners, and this, going hand in hand with great improvements in concentration will, undoubtedly, result in the establishment of a solid graphite industry.

The general public nowadays is apt too much to live under illusions of prospects of great wealth; they invest blindly in mining ventures where according to their opinion great wealth awaits them, or is, at least, bound to come by persistently putting holes in the ground. As a rule, they consider mining as a gamble, and not as a legitimate business as in any other walks of life. They flee the practical miner who offers a mine abounding in low priced ores; but they listen attentively to the promoter with his fairy tales of fabulous silver finds in the Cobalt district, who will eventually do "mining" himself—not in Cobalt but in the pockets of the public. What is the result? The resources of the lesser minerals lie dormant and are not developed. I have a case in mind where large tracts of graphite lands, with numerous outcrops of fine flake graphite could not find a buyer for years, until American capitalists took hold of them recently. They, by further exploration work, found that the ore bodies were of such large extent that now two graphite separation plants are in course of construction, and over one million dollars has thus been invested in the last two years.

It is gratifying to know that American capitalists are now taking a hand in the development of these resources. They have not been slow in recognizing the great value of these deposits; and that is not all—they have also realized the great value of concentration in making the mineral marketable,

and here—I venture to say—lies the secret of success in the case of graphite mining.

I trust I may be permitted here to discuss some of the principal causes which retarded measurably the healthy progress of this industry. The graphite ores of even the same composition cannot always be treated by similar methods, on account of the different physical characteristics of the mineral occurrences. This difficulty is apparent in the case of ores containing flake graphite, as well as in those containing only dense or amorphous graphite. Both of these ores occur in some localities in gniess, but it would be futile to attempt to apply a process, which gives perhaps good results in the separation of these ores occur in some localities in gneiss, but is even more complicated, when ores containing both varieties are to be treated.

Another difficulty arises from the fact, that in some localities the gangue, accompanying the mineral, is found to change as development proceeds, and it must be said, that this is one of the principal sources of difficulties in the construction, operation and adjustment of graphite mills. The selection of one or the other method is very often based on guess work, and with very little regard to what the general "run of mine" is likely to be. When a deposit of graphite is discovered, a number of test holes are sunk, as a rule, to determine the character of the ore, or to trace the ore lode on the surface; where the ore appears to be of satisfactory quality and quantity, larger excavations are made, or a shaft is sunk, or a tunnel is run, following the trend of the ore body, and in the majority of cases, where quick returns are essential for the continuation of the enterprise, the construction of a mill for the treatment of the ore is proceeded with, based on preliminary tests with ore generally taken from chutes, which promise to deliver the bulk of the material to be treated. Very often, however, it is found in the further development of the mine, especially in the crystalline formations that the ore changes in character, both physically and mineralogically. That, for instance, an ore originally flaky turns into one that is both flaky and amorphous; that, further, the gangue with the accessory minerals change, and so on, and the result is that the mill which was originally laid out and constructed to suit a specific class of ore has now to treat an entirely different one. A series of experiments then demonstrate, that the arrangement of the apparatus and perhaps these themselves have also, to be changed, in order to meet these new conditions; sometimes an entirely new system has to be adopted, which in the majority of cases can only be done by spending a large amount of money.

The author has a case in mind, where a property was superficially tested and found to contain flake graphite in quartz. Before proceeding with the development of the mine, to determine the extent of the ore body and its character, a mill for the treatment of the ore was erected. In developing this mine, however, it was discovered, that the contents of flake diminished, and that, instead, amorphous graphite appeared. That, further, the gangue changed from quartz into pure calcite. The consequences were obvious. Change after change had to be made in the mill in order to meet new conditions arising solely out of the development of the mine, but with little success, until it seemed inadvisable to alter the existing milling process. The construction of an entirely new mill was the only remedy, but the financial resources being exhausted mill and mine were shut down.

We learn from this example, that the construction of a mill to treat the ores of a mine should only be proceeded with, when all the conditions, the character of the ore, as well as the extent of the ore body, are fully known, and this can only be attained, if the mine is developed properly, the stopes laid open, and the different ore shutes thoroughly tested as to their contents in useful and waste material. Until such is the case experiments on a large scale with the ore should be deferred, the preliminary outlay for opening up the mine is insignificant compared with the large expenditure, to say nothing of the trouble and annoyance, resulting from the premature erection of a milling plant, with a system based upon guesswork, hasty judgment, and insufficient knowledge of the conditions really existing in the mine.

Mechanical ore separation is an ancient art, but during the last ten years it has experienced some remarkable improvements. These have revolutionized the practice of ore dressing in general; it appears, probable, that there will be still further innovations, of a character not yet clearly foreseen, except by some inventors who are working on special lines. Even as recently as five years ago there were practically no methods of mechanical separation, except hand sorting, jigging and washing on tables, and magnetic separation, the last method having only a very limited application. Since then radically new processes, such as electrostatic separation, oil concentration and the flotation of minerals in certain baths have been discovered. In these ways it has become possible to separate a wide range of minerals of close specific gravity, that cannot be separated by jigging or slime washing. Similarly, it has been demonstrated, that phosphate can be separated from hornblende, the difference in specific gravity being only 0.35, further molybdenite, monazite and other rare minerls, can be separated from their gangue, which it is often difficult to do by ordinary gravity concentration. Experiments have shown that graphite may be separated electrostatically from its gangue, and it is not unlikely that such a process will be developed commercially before long. These experiments have been, to a certain degree, successful, and, it may only be a question of time and of some improvements, before a

complete success is attained. It may be of interest to quote the following note from W. R. Ingalls* on general ore separation: "Probably few realize the probable extent of development, which they will experience during the next ten years, or what results may be achieved by them. It is quite certain that no single process is a universal panacea for all the difficult problems of ore treatment. For certain ores one process is best adapted; for other ores another process. For still other ores the best results may be achieved by a combination of two, or three, or even more of the special processes. This is a direction of effort, that has not yet received very much attention. It will be, however, the logical result when the design of such ore dressing plants passes out of the hands of the promoters of special processes into those of the engineer, who is retained by his clients to secure the best results."

Gentlemen, I trust that you have fully understood the purpose of my paper. I have drawn your attention to the fact that good mining engineering besides geology, mechanical engineering and surveying, requires also a thorough knowledge of the principles of ore separation. It is often asserted that in order to make this or that ore marketable, it is only necessary to write to an engineering firm, who will put up the concentration plants at a contract price. This procedure is as stupid as it is unbusiness like. Each firm has certain special machinery to sell, which might work in a satisfactory way, on a specific mineral of a certain chemical composition or physical qualities; but these machines do not give satisfaction on every ore. Generalizations on this subject are entirely impossible, and it is the engineer in charge upon whom falls the task of devising such apparatus, or of making such combinations of known apparatus as will enable him to make the best extraction of his ore. It is when face to face with cases of this kind that the mining engineer can show of what stuff he is made; whether he has fully grasped the value and applicability of general concentration principles.

Many a mining enterprise has been doomed to failure because the party at its head had no knowledge of the theory and practice of the separation and classification of ores. It is not sufficient for an engineer to know whether this rock is a granite, or that one a diorite; it is not sufficient to unearth hidden treasure and bring it to the light of day; no, in ninety out of a hundred cases, the real work and trouble begins with the preparation of the ore for the market. It is all very well to dig out silver by the bushel as they do in some of the Cobalt mines. These mines are exceptions to the rule, and they form only a very minute percentage of the working mines. Gentlemen,—and I mean specially those young fellows who are preparing for the difficult task of the mining engineer,—only a few of you will have the pleasure of becoming the leading spirit of a mining enterprise, where there is abundance of rich ore, and where there is perhaps no difficulty in marketing whatever you get out of the mine. But, I venture to say, that most of you in the course of your professional career, will have to confront other more serious problems, some of which will tax not only your knowledge of concentration but also your resourcefulness. You may be called upon some day by people who put unlimited confidence in your ability, to take your place at the head of a large mining enterprise, to answer the fundamental questions which determine the value of a property: How much will it pay? How long will it pay? And how much will it cost?

Gentlemen, I think I have already taken up too much of your time, yet in conclusion may I be permitted to say one word more: Do not neglect the study of the fundamental principles of ore separation and classification.

I trust that I have shown you in the examples I have mentioned why you should devote much of your time to these subjects. You enjoy such great facilities here in McGill University, that I should think you would find no trouble, whatsoever, in making yourselves acquainted with the subject under discussion. You have all the important machines that are used in concentration, and on which you can study at your leisure the principles involved, and in this respect, McGill is far ahead of any other institution of a similar nature. I remember that, when I was studying at the Academy at Aachen, Germany, our mining professor explained the working mechanism of various apparatus by small models, which were supposed to be true copies, and that we never had the opportunity—as you gentlemen have here in this institution—to put these to practical tests. I must congratulate you upon the splendid equipment of your mining laboratory and concentration plant; but this is simply due to the untiring efforts of Dr. Bonsall Porter.

* "Engineering and Mining Journal," 1905, to page 643.

CLAY AND THE CLAY INDUSTRY IN ONTARIO.

By W. G. M.

The more stable but more prosaic mineral industries of a country are apt to be neglected somewhat for those which appeal more strongly to men's imagination or cupidity The clay working industry, which next to agriculture, can be called the most ancient of industries, has up to the present been almost neglected by scientific workers, although during late years in Germany, the United States, and in other countries, it has been receiving more attention. Several of the States of the American Union, and other countries, now have departments devoted to the study of clay and its products. In Ontario the clay industry has grown rapidly during

recent years. Brick, being cheaper than stone, is being used in modern cities in place of wood on account of fire protection purposes. As years go on, the clay industry must become proportionately more important. It is well, therefore, at this time, for Ontario to have a systematic report such as that of Mr. M. B. Baker, on "Clay and the Clay Industry," The report is now in press and will be distributed at an early date by the Bureau of Mines, Toronto.

In Part I. of his report Mr. Baker gives, in 41 pages, an account of the character, origin and modes of occurrence of clay, written in such a way as to be understood, it is believed, by persons who have had little technical training. His age classification of clays will doubtless be found very useful by manufacturers as well as having an educational value from the side of culture. Every worker's interests will be widened and his mental attainments broadened by his understanding something of the origin and relationships of the materials with which he is dealing. There is nothing in Mr. Baker's report treating of the relationships of the various shales and clays—Erie, Red Top, Leda and Saugeen—with which every clay worker in the Province has something to do, that cannot be understood by almost any one who can read English. Manufacturing difficulties will thus be avoided and a scientific knowledge will be gained which cannot be estimated in mere dollars and cents.

The 15 pages of Part II. are devoted to the manufacture of clay products. In these pages the methods of manufacture are described and practical hints are given for overcoming difficulties which are met with almost daily in manufacturing

In Part III., pages 56-112, typical shale and clay working plants are described under the heading of counties, which follow one another in alphabetical order. This part of the report will be of local interest. The clay worker who desires to gain a knowledge of the modes of occurrence of his material, will have descriptions of similar occurrences in his own county with which to compare it.

Pages 112-120 deal briefly with various industries in which clay is used as part of the raw materials.

The 71 illustrations in the report have been carefully selected to represent typical occurrences of clay and shale, to throw light on the modes of occurrence of these materials and to represent various machines and plants used in the clay industry in the Province.

Mr. Baker's work in connection with the industry has not only been of value in the preparation of this report, but he has done work, which has been highly commended by clay workers in various parts of the Province, in giving practical advice in his visits to many plants.

Three or four years ago the clay workers, first of Ontario, and now of the whole Dominion, organized a society known as the Canadian Clay Products Manufacturers, which holds an annual meeting—the last three being at Waterloo, Hamilton and Toronto respectively—at which numerous papers are read and discussions are held on various topics connected with the industry. These meetings have proved very valuable and every clay worker of the Province should join the rapidly growing membership of the society.

The statistics of the clay industry show more clearly than can otherwise be done the relative importance of clay among mineral products. In this Province the manufactures from clay have till recently represented nearly 20 per cent. of the output of our total mineral industry. In the United States clay products form nearly 10 per cent. of the very large mineral output. Moreover, it should be remembered that a high percentage of the receipts from the clay industry are expended on labor and supplies. From this point of view no mineral industry can be claimed to benefit a community or a country more than that of clay.

BRITISH COLUMBIA IN 1906.

By Arthur Wheeler, Jr., Vancouver, B.C.

The year just past has been by far the best, from the standpoint both of tonnage and value, that British Columbia has had since her advent into the list of mineral producing countries of the world.

While the figures following are only approximate, full returns not being yet available, they have been compiled by Mr. Wm. Fleet Robertson, Provincial Mineralogist, and may be taken as rather under than over the mark.

Compared with the official figures for 1905, the estimate is:—

	1906.	1905.
Gold	$6,070,000	$5,902,402
Silver	2,200,000	1,971,818
Copper	8,690,000	5,876,222
Lead	2,690,000	2,399,022
Coal	4,590,000	4,152,936
Coke	1,050,000	1,358,925
Miscellaneous	1,100,000	800,000
Totals	$26,390,000	$22,461,325

Worked out these figures mean that copper has increased in value of production 49 per cent.; lead, 13 per cent.; silver, 11.6 per cent., and gold 3 per cent. Coal production has increased 10 per cent. and miscellaneous products 13½ per cent. Coke has fallen off slightly, owing to the seven weeks' strike in the Fernie coal mines during October and November last.

This strike not only lowered the possible production of coke, and coal, but seriously affected the copper, lead and silver production, as during the strike practically all the up-country smelters either closed entirely or seriously curtailed their output.

Consequently many of the mines ceased mining and undertook repair work, and, this reduced the possible output by perhaps $5,000,000.

As can be seen from the table above the total estimated value of British Columbia mineral output last year reached the enormous total of $26,390,000, which one, taking the population of the province as only 200,000, being less than the population of the city of Seattle, the fact of the richness of this province is made more apparent.

Figuring out the per capita production of mineral, mined in British Columbia in 1906, shows that nearly $132 was produced for every man, woman and child in the province.

Tonnage.

From statistics to hand, the ore tonnage for the past year is as follows:—

	Tons.
Coast (estimated)	90,000
Boundary	1,155,138
Rossland	281,711
Slocan-Kootenay	133,299
Total	1,660,148

ATLIN.

The gold output for this district for 1906 was approximately $500,000, with every prospect for a much increased production for the coming season, due to the fact that the advent of the Guggenheim Exploration Syndicate has led to much better processes for saving the gold and on a very much larger scale than heretofore.

Pine Creek.—Work on this creek has been confined almost entirely to two companies, the Pine Creek Power Company and the Atlin Consolidated Mining Company. Both of these companies have been very successful. The former operated two pits with three giants with 7-in. nozzles in each pit. From 20 to 25 men were employed in each pit and the plan of exploding 2,000 pounds of 75 per cent. powder in one blast was adhered to with the same gratifying results as in 1905.

The Atlin Consolidated Mining Company is operating above the Pine Creek Power Co. The company did not get properly started until August, when a 70-ton Bucyrus shovel was installed. After work started in earnest $1,000 was taken out every 24 hours.

On Boulder Creek, a tributary of Pine Creek, La Societe Miniere de la Colombie Britannique realized $40,000 for the season's work.

Spruce Creek.—It is this creek that the Guggenheims intend operating. They have secured practically everything excepting the property of the Spruce Creek Power Company. They will, in all probability secure enough stock in this company to gain control and will then, according to Mrs. Rosalind Watson Young, A.M., I.M.E., to whom I am indebted for the information concerning Atlin, which appears in the current number of the B. C. Mining Exchange, put in a bedrock flume and mine the gravel by steam shovel.

A company operating on Spruce Creek called the Northern Mines, Limited, has come to grief through having two managers. Another, the Columbia Hydraulic Company, has sold out because it installed a plant without having first prospected the ground, and still another, the British Columbia Dredging Company only operated for one month and, as returns were unsatisfactory, then ceased operations.

So far dredges have proved a total failure in Atlin and only steam shovels have paid the big operators.

McKee Creek.—Work is now confined to the McKee Amalgamated and the McKee Consolidated Companies, who have control of the creek. These two companies are under one management. H. Plumbe, who has been in charge for two years, in the absence of the Hamshaw Brothers, has secured for his company about $50,000 each year. In the coming season a steam shovel and tram system are to be introduced. McKee has been a dividend producer.

Speaking of this company, Mr. Fletcher T. Hamshaw, the manager, said recently: — "The steam shovel will be operated in conjunction with the hydraulics already in operation. I will hydraulic off the top material down to within 12 feet of bedrock, and pick up the gold-bearing gravel together with four feet of soft bed rock with the steam shovel.

"The plant will consist of a Bucyrus 110-ton steam shovel, one mile of railroad and switches, 30 six-cubic yard cars, two 20-ton electric locomotives and 1½ mile of flume. A permanent washing station will be built on the hogback near the canon, giving 160 feet of a dump, and the dump is at a point where the creek has a 12 per cent. grade. Ten cars will be dumped at one time, and all boulders will be hydrauliced on the grizzly under 150-foot head. There is a 120-foot dump for the grizzly. The system is gravity throughout. Owing to the heavy grade on this creek, the haul will be less than one-half mile on a down grade of one foot per 1,000 feet. The physical conditions are very favorable to economic working. A small sawmill will be taken in this winter on the ice, and the lumber sawed on the ground.

"The Guggenheims have made a success of their steam shovel on Tar Flats this summer, and I understand have bonded one-third of the district, so that I expect next year will see a great deal of development work, and the installation of new plants will greatly add to Atlin's output, and make it one of the heaviest gold-producing sections of the North."

WINDY ARM AND WHITE HORSE.

In both these districts extensive work has been going on all last season. A large number of properties are being opened up in and around Conrad City and Wynton, a town on the British Columbia side of the boundary line, built at the foot of Windy Arm.

Near Tutshi Lake some rich strikes have been made, copper, gold and silver values being very high in many of the ores found.

In all probability a smelter will be built at White Horse this summer.

The ores there are rich in copper, some shipments having realized 30 per cent. net at Tacoma, Wash., U.S.A., smelter. This long haul militates against the successful development of the camp and it is reported on excellent authority that Capt. John Irving of Victoria, B.C., the pioneer in copper mining, has succeeded in raising the necessary capital for the erection and working of a smelter in the White Horse district.

It is also reported that a large concentrating works will be erected at Conrad City to reduce the ores of the Windy Arm camp.

COAST DISTRICT.

The writer has just returned from an extended trip up the British Columbia coast and found throughout the entire coast line the signs of the most encouraging activity. The weather at present and for some time past has been too severe to permit of much work being done, but just as soon as the spring opens there will be one of the most startling mining booms that the coast has ever seen. During the trip I interviewed several miners returning from Portland Canal and the interior and all had the same story to tell of splendid mineral found and lots of it. Coast mining will be the subject of a future article and anticipating that I will briefly review the actual mining done on Portland Canal, Texada and Vancouver Islands.

Portland Canal. — The progress of this camp during the past season has justified all expectations. The many properties on which development work has been done has proved the fact that the ore bodies are of great extent and permanency.

Several new strikes were made, and of the many prospectors who visited the district, and prospected for the season, not one failed to locate property of value. Many of these also took up pre-emptions and purchased lots in the townsite, and erected houses on their holdings.

A considerable number of mining claims changed hands, and many more deals would have been made, but the prospectors for the most part refused to consider any proposition other than a part cash payment down, which in most cases led to the deal falling through. This policy is bad for the camp and and also for the prospector.

The delay in commencing the construction of the bridge across the Bear River, which is confidently expected will be built this fall, retarded progress greatly; the heavy snowfall of last winter caused an unprecedented high water in June and July, which rendered the cable by which the river is at present crossed unavailable for days at a time. In attempting to ford the swollen stream a party of prospectors were swept off their feet and only succeeded in reaching the shore by a miracle.

On Glacier Creek the greatest activity was manifested. McGrath and Griffin have exposed their lead on the Little Joe and Lucky Seven for the entire distance of the two claims, and have crosscut it in several places, exposing ore in every cut. They have also run 30 feet on the vein, and will continue work all winter. The Stewart Trading Company have an option on this property, which is one of the best located in the district, being only five miles from tide water and at an elevation of 2,000 feet. The average width of the vein is six feet, which is galena and iron pyrites with considerable lead carbonates, and the values run from $30 to $400 per ton in silver, lead and some gold. The vein lies in the contact between slate and porphyry, and the strike is N.W. and S.E., being the same as practically all the ledges in this district.

Adjoining McGrath and Griffin's property the Portland Development Company have a force of men at work sinking a shaft on their main lead, the ore of which is similar to other veins in the vicinity, the iron pyrites carrying gold to the amount of $60 per ton.

On the Olga, purchased a year ago, for a few hundred dollars, D'Arcy McDonald has a good showing, an average assay of the dump giving $51 in silver and lead.

A half interest in the Jumbo group was sold to S. Silverman, of Seattle. S. Gourley, who still retains the other half, has refused many offers for his interest. No work was done on this property other than the usual assessment work, which was also the case on the adjoining claims, the Halla and June. An offer to bond these claims for $30,000 was refused a year ago, but a deal is now pending at an increased figure.

Some new locations were made adjoining these claims by J. Welch, P. Boyle, Hucker and Strickland, of Ketchikan. This ore is arsenical iron pyrites, and carries values gold, $37; silver, 6 oz.; copper, 2 per cent. A group of claims was also located by J. Perault, for Ketchikan people on similar ore, three miles further south, the average from which was $10 in gold.

Rush and Bagg have been working on their lead all summer, and have proved the property to their satisfaction. Some of the ore from this claim runs 2,000 ozs. in silver.

On claims owned by M. K. Rogers the usual assessment work was done. The Copper King was

bonded by G. M. Brown, of Seattle, the first payment has been made, and Mr. Brown, who is now in Seattle, is expected back shortly, with material to work the property all winter. This ledge is 39 feet in width, and carries values from 8 to 12 pert cent. copper with a little gold.

McKay and Bibeau will ship some ore this fall from their claim, which is proving, on development, to be one of the best in the district.

Bert Ranche will make a ten-ton trial shipment from his claim, the Main Reef, as soon as the Stewart Land Company have finished their floating wharf. The ore averages $90 in silver and lead, and the property is favorably situated, being only six miles from tide water.

On the Sunbeam the ledge has been traced throughout the entire claim, and open cuts run, showing up a large body of ore, with a well defined pay streak.

Several new locations were made on Bitter Creek, of which the Copper Canyon group seems the most promising. The main ledge on this property is three feet in width, lying in slate and porphyry, and contains values of $41 in copper and gold.

On the Roosevelt, a copper-gold property on which development work has been carried on for some years, a four-foot vein of galena was located, which promises to rival the original location both in extent and value.

While doing assessment work on the Rainier, Fred Rainey discovered a three-foot vein of galena and quartz with about eight inches of lead carbonates, an assay from which gave $174 in silver and 60 per cent. lead.

Among new locations made was the Greenhorn group, a three-foot ledge of quartz carrying copper 12 to 20 per cent., silver 6 oz. Also a group of claims 22 miles from Stewart on an iron cropping carrying values in gold and copper.

On American Creek, the American Girl group maintains its pre-eminence. Only assessment work was done on the claims this season by the owners, who, owing to the San Francisco disaster, were involved in a delay in regard to the taking over of the property. A new lead was discovered on the ground carrying high values in silver.

On the May Bee and Louise a tunnel was run on the ledge which is 17 feet in width; the pay streak is 2½ feet, and averages $35 in silver. This ledge is crosscut by a canyon, and a vertical depth of over 100 feet of the vein is exposed.

Assessment work was also done on the Rangoon and Bandolier, and some good ore discovered, assays giving silver, $341; copper, 27½ per cent.

Work was carried on all winter on the Kansas group, and 70 feet of tunnel run. Some new locations have also been made on this creek which promise well. The season is now practically over, and many of the prospectors are leaving. Many have gone to Maple Bay Mines, where 150 men are now at work. It is expected that about 50 men will winter here, and should the erection of the bridge be commenced immediately probably many more will remain.

Texada Island.—On Texada the Marble Bay Mine has been steadily shipping high grade bornite ore all the year at the rate of 1,000 tons per month, netting the operating company about $25,000. This mine is perhaps the most profitable in British Columbia and has the best showing of copper ore in the province. The ore at present being mined is obtained at the 800-feet level which is 950 feet below sea level. The writer visited the mine last April and thanks to the courtesy of the manager, Mr. Alexander Grant, had the privilege of examining the mine in company with Mr. Charles Sangster, the coast representative of the Rand Drill Company, and several well-known mining men from Vancouver, including Mr. W. Thos. Newman, M.C., M.I., and the foregoing facts were ascertained then and have since been corroborated by many.

Further north, on Texada Island, the Loyal group owned and operated by Mr. Jacobs, of Seattle, is showing up well as are also the Copper Queen and the Cornell adjoining the Marble Bay. The two are operated by Seattle capital and are both paying good dividends.

Half way across the Island and five miles from the Marble Bay, W. Thos. Newman is opening up the Commodore Mine with considerable success. The showings on this property are remarkable and the geological conditions offered a field for the most thoughtful consideration and were most carefully investigated before any work was undertaken.

The work on the Commodore is now in an advanced stage and Mr Newman reports that next summer will see the Commodore a big producer.

Vancouver Island.—The Tye Mine, on Mount Sicke, has continued to ship ore all year and, in addition, has been steadily sinking, prospecting for the ore body at depth. In this mine the main ore body extends through Mount Sicke in the form of a huge shoot at about the 300-feet level. This shoot is about exhausted but the management has succeeded in locating similar ore but of much lower grade at the 1,000-feet level, and is now cross-cutting this body at the 1,250-feet level. Whether this cross-cut has cut pay ore or not is not yet known. The Tyee Company, however, is in splendid shape, and after paying dividends for years, building a smelter and operating the mine, has the original capital intact in the books in London, Eng., and can by securing new ground still continue business. Mr. Clermont Livingstone, the resident managing director, reports that work on an adjoining property, the X. L., is showing up some good ground.

Adjoining the Tyee is the Richard III, in which, recently, an important strike of high-grade copper ore was made. This property will be one of the

Canadian Government Mineral Exhibit, Christchurch, New Zealand.

most important shippers in Vancouver Island this coming year.

On the west coast of Vancouver Island, there is every prospect of renewed life in a mining sense this year. Very little work of any description was done last year.

THE INTERIOR.

While on the coast there has been, and is, a very healthy movement in mining, the interior mines have been the mainstay of the industry during the past year. The great bulk of the tonnage has, as can be seen from the table of shipments given at the beginning of this article, come from the Boundary country, assisted materially by Rossland and Slocan-Kootenay.

The greatest producer has been, and is, the Granby Company, operating at Phoenix. Out of a total ore tonnage from the Boundary country of 1,155,138 tons, this company shipped to their smelter at Grand Forks, 804,598 tons or 69 per cent. The Dominion Copper Company ranks next with 216,788 tons and the British Columbia Copper Company third, with 121,241 tons.

The output of the latter company was curtailed very considerably owing to the fact that the plant at Greenwood was closed down for several months while the smelter capacity was being doubled. The smelting capacity of this plant is now 1,500 tons per day and a very large increase may be looked for from the British Columbia Copper Company's mines this year.

According to Mr. W. B. Wilcox, the editor of the Phoenix Pioneer, to whose excellent special number, just published, I am indebted for the information on the Boundary, in six years and a half the mines of the Boundary have sent out to the district smelters approximately 4,644,000 tons of ore. This is from 1900, in the midle of which year ore shipments were commenced, to the end of 1906. It will thus be noted that the progress has been little short of marvellous. In 1900 but 97,000 tons were shipped, while in 1906 a total of about 1,191,000 tons of Boundary ore were dug out of our mines and sent down the hills in different directions to the three district reduction works—eleven times as much in 1906 as in the year 1900. To show the yearly progress and increase of output the following table is given:—

1900	97,000	tons.
1901	390,000	"
1902	509,000	"
1903	690,000	"
1904	830,000	"
1905	953,000	"
1906 (Dec. estimated)	1,191,000	"
Grand total	4,660,000	"

Not only has the British Columbia Copper Company increased the capacity of their smelting plant but the Granby Company has also considerably enlarged some of their furnaces, and at present the Dominion Company are spreading out and are at least doubtling their smelter capacity at Boundary Falls.

The recovery of copper per ton from the ore of the mines of the Boundary is known to be low, comparatively speaking, and an average rate of 25 to 30 pounds per ton is considered conservative. On this basis, the copper fine production of the Boundary mines for the first year of ore shipping, 1900, was but 3,000,000 pounds. On the same basis, the recovery for 1906 will amount to about 35,000,000 lbs.—an amount sufficient to make it worth while in the world's grand total. Altogether the mines of the Boundary in these seven short years, have contributed approximately 140,000,000 pounds of copper. In addition to this there are the gold and silver values to be considered. The values of the ores thus treated would amount to more than $25,000,000, not taking into consideration the high prices prevailing for the brown metal for the last year or more.

The Granby Company is spending about $100,000 at present on the Victoria property shaft and headworks. This shaft, when completed, will be the permanent working outlet for the whole of the company's mines in Phoenix. They are now down 400 feet, the shaft has been timbered and will be ready for use in the early spring. The hoisting engine will be driven by electricity and is 250 h.p. There are at present two crushers of 150 tons per hour, minimum, capacity and another is being installed at the headworks of a like size, giving the company the necessary machinery to crush 450 tons per hour, minimum.

Ore bins are being erected at the shaft and both the Canadian Pacific and the Great Northern Railway companies are making arangements for connections.

Development work has been steadily pushed and is now years ahead of needs. More properties have been secured. The Gold Drop group has been extensively exploited and has proved the property has immense tonnage. On the Curlew a large tonnage has also been opened up. This claim being below the Gold Drop may eventually be used to tap the ore reserves of the latter by means of tunnelling.

On the Dominion Copper Company's property new machinery is being installed with a view to increasing the shipments to meet the requirements of the new enlarged smelter.

The B.C. Copper Company has been working towards a much larger output from their Mother Lode mine. The output from this mine will be trebled and will, it is confidently expected, ship 1,500 tons per day this year. The Emma, in Summit Camp, on the C. P. R. branch, from Eholt to Phoenix, has also been extensively developed. The company, last year, purchased outright the Oro Denoro, adjoining the Emma of the B.C. mine in the same camp. The B.C. mine, in the past, has shipped 100,000 tons of ore while the Oro Denoro is known to have large reserves of ore which can be cheaply mined, and being situated right on the railway very cheaply shipped.

A most important feature in connection with the huge operations in the Boundary country, is the fact that the Granby Company has paid dividends during the past year at the rate of 12 per cent. on a capitalization of $15,000,000 on 1.1 per cent. copper ore. Considering that the original price of the stock was 25 cents on the dollar this means that original holders received, last year, about half their original investment back in the shape of dividends and hold their stock now at 33 per cent. above par.

One important feature of the year's development in the mines of the Boundary was the advent of the Consolidated Mining & Smelting Company of Cananda to Phoenix, when that company took a lease on the well known Snowshoe mine here. That this company, which is operating so successfully at Rossland, should reach out into the Boundary and take up one of the large properties, is another evidence that the Boundary is attracting the attention of more and more mining men of note. The Snowshoe is now shipping ore daily.

While Boundary's copper mines have been shattering all previous records for output, etc., the high grade silver and gold mines of this section have not been forgotten. Chief among these is the Providence, near Greenwood, which is to-day a better mine than ever before. A dividend of some $16,000 was paid in September, and development with some 35 men has been steady all this year. The company will doubtless make an even better record during the year to come.

The Skylark is another silver mine that has done well, having paid for development and the bond also from the proceeds of the ore shipments in the last two years. Its Phoenix owners should begin to receive some profits this coming year.

Among the large number of mines in the high-grade belt that are looking well and doing satisfactorily may be mentioned the Elkhorn, Prince Henry, Strathmore, Bay, Mavis, Crescent, Don Pedro, E. P. U., Helen, Tip Top, Greyhound, Moreen and a dozen others.

(To be continued.)

THE CANADIAN ROCKIES.*

By Reginald A. Daly.

(Continued.)

It is well known that one of the first designations of the entire mountain group lying between the Pacific and the Great Plains was due to Humboldt. His "Cordilleras of the Andes" extended from Cape Horn to the mouth of the Mackenzie river. Humboldt occasionally used the singular form "Cordillera of the Andes" for the same concept. In view of the general restriction of the term "Andes" to the mountains of South America, Whitney, in 1868, proposed that the name "Cordilleras," with variants, "Cordilleran System" and "Cordilleran Region," be retained to designate the North American equivalent of the Andes. This name was adopted in the United States census reports for 1870 and 1880, and by a great number of expert geologists and geographers since 1868. In process of time, however, the singular form, "Cordillera" and variants, became used in the same sense. In one of these forms the Humboldt root word with Whitney's definition has entered many atlases. It appears on numberless pages of high-class Government reports, geographical, geological, and natural history memoirs, and of such works as Baedeker's "Guide-book to the United States," Stanford's "Compendium of Geography," etc.

The time-honored, erroneous, similarly inclusive name "Rocky Mountains," with variants, "Rocky Mountain System," "Rocky Mountain Belt," etc., has, however, held the dominant place in the popular usage. Its inappropriateness for the heavily wooded Canadian mountains is abundantly evident. For the United States, Clarence King wrote a generation ago—

"The greatest looseness prevails in regard to the nomenclature of all the general divisions of the western mountains. For the very system itself there is as yet only a partial acceptance of that general name Cordilleras, which Humboldt applied to the whole series of chains that border the Pacific front of the two Americas. In current literature, geology being no exception, there is an unfortunate tendency to apply the name Rocky mountains to the system at large. So loose and meaningless a name is bad enough when restricted to its legitimate region, the eastern bordering chain of the system, but when spread westward over the Great Basin and the Sierra Nevada, it is simply abominable."†

The following table summarizes the above-mentioned variants along with others more recently introduced, and still other general names now only of historical interest. The names of prominent authorities and the leading dates when they have published the respective titles are also entered in the table. The authority for some of the older names is Whitney's work on the United States, published in Boston, 1889.

Mountains of the Bright Stones—
General use, end of eighteenth century.

Shining Mountains—
Morse, "Universal Geography," 1802.

Stoney or Stony Mountains—
Arrowsmith, 1795; President Jefferson.

Columbians (*sic*) Mountains—
Tardieu, 1820.

Chippewayan Mountains—
Hinton, 1834.

The Cordilleras of the Andes (in part)—
Humboldt, 1808, etc.

The Cordillera of the Andes (in part)—
Humboldt, 1808, etc.

The Cordilleras—
Whitney, 1868; many authors since.

The Cordillera—
G. M. Dawson, 1884, etc.; Gannett, 1898; Rand-McNally, 1905.

The Western Cordillera of North America—
J. D. Dana, 1874, 1880.

The Cordilleras of North America—
Hayden, 1883; Leconte, 1892, etc.

The Cordilleran Region—
Whitney, 1868, etc.; Hayden, 1883; Shaler, 1891.

The Cordilleran System—
Whitney, 1868, etc.; King, 1878; Baedeker, 1893.

The Cordilleran System—
Hayden, 1883.

The Cordillera Belt—
G. M. Dawson, 1879; etc.; Rand-McNally, 1902.

The Pacific Cordillera—
Russell, 1899, 1904.

The Cordilleran Plateau—
Hayden, 1883.

The Cordillera of the Rocky Mountains—
J. D. Dana, 1895.

The Rocky Mountain System—
Leconte, 1892, etc.; Heilprin, 1899; many others.

The Rocky Mountain Region—
Powell, 1875, etc.; G. M. Dawson, 1890; Gannett, 1899.

The Rocky Mountain Belt—

THE TREATMENT OF ARSENICAL ORES.

By Chester F. Lee, Mining Engineer.

The Cascade range is noted for the arsenical character of many of its ores. At Monte Cristo, Goat Lake, Silverton, Silver Creek, Elba and many other places a considerable arsenic content is a characteristic. Not all the ores of this range are arsenical by any means, but those in which this constituent is prominent are so widely spread and so considerable in amount that the handling of them and the getting of some return for the arsenic contained is a vital matter. The only plant in the state that can make marketable arsenic (the white arsenic of commerce, As 2 O3) is at Everett, and indeed, until 1904, when the Anaconda works in Montana were supplied with a plant for extracting arsenic from flue dust, this was the only place in the United States where it was made.

At the present time, what ores of this class are treated at all are shipped to smelters and treated as gold or silver ores pure and simple, and a penalty of about 50c is exacted for each per cent. of arsenic over a certain amount and the smelters refuse to take on any terms ores high in this metal; as they claim that the volitilization of arsenic in the roasting furnaces and the smelter stacks causes undue losses of the precious metal. Producers of ore have long contended that not only should they not be penalized for their arsenic, but they should be paid for it. They point out that the Anaconda works has produced, in the three years ending July 1st, 1906, 1,107,176 pounds of white arsenic, all of which was sold at a good price and all of which came from a by-product, flue dust.

If this is the case, how much more ought their ores, rich in arsenic and of fair gold and silver values, to have the treatment suited to them the pecuniary benefit of which would be felt in every mining district of the state.

The quantity of these ores and the development work done on the properties that can produce them is sufficient to warrant a constant and increasing supply; why, then, cannot this metal receive the same sort of attention accorded to copper, lead, zinc, etc.? The reason probably is that the metallurgy of arsenic has had no attention in this country, as heretofore there has been no visible supply of the raw material. The beginning of better things seems to be now at hand, and the American Smelting & Refining Co., to whose tender merices we seem to be irrevocably committed as far as reduction works are concerned, are said to have promised some return for arsenic in a certain district, provided a sufficient tonnage to be regularly shipped was guaranteed them.

White arsenic is worth on the average from 3 to 3½ cents per pound. This is the grade known as "commercial."

You will see quoted in the lists of chemicals "refined" and "C.P." (chemically pure) at rates several times this and at the present time, in sympathy with other metals, the price is considerably above this, but an average of 3½ is all that it is safe to count on year in and year out, for the unrefined product.

The general run of the Cascade ores of this class contain from 3 to 10 per cent. of metallic arsenic (As.). About 6 per cent. may be taken as a fair average, as that is what a careful sampling of two of the best known mines gives. Six per cent. metallic arsenic will produce 160 pounds of commercial white arsenic theoretically (6 per cent. is 120 pounds per ton; allow one-third more for the oxygen absorbed from the air, as the atomic weight of As2 is 150, and of O3 is 48.), and we have 160 pounds white arsenic, allow 5 per cent. loss on this in the process of obtaining it, and we have 150 pounds net; now deduct for the cost of reduction, packing in barrels, freight, etc., 1½c per lb., and we have 150 pounds at 2c., or $3.04 as a fair return on a 6 per cent. ore. Many of our Cascade ores carry from $6 to $10 in gold and silver, and this extra $3 would make all the difference with them between success and failure, between profit and loss in the mining operations. It costs not a cent more to get this ore out than formerly, and if $3.00 even can be added to the returns, it is an addition to the net.

Aside from the possibilities of shipping and smelting the ore raw there are at least three other courses open: 1. Water concentration with subsequent smelting of concentrates. 2. Cyanidation of the raw ore for gold and silver, and subsequent roasting for arsenic. 3. Roasting for arsenic with subsequent smelting of the roasted residue.

To take them up in order: Water concentration has been tried at Monte Cristo with only partial success. The sulphides and arsenides which carry the values are softer and more brittle than the quartz in which they occur and excessive fines and slimes result from grinding, the losses in this particular case are said to have run from 30 to 40 per cent. This mill has been lately repaired and will begin a new campaign in the spring under new management and the results will be looked for with interest. There are arsenical ores in other places in the Cascades better adapted to concentration than those of Monte Cristo, ores that are less massive and more granular as to the sulphides and in which the quartz and other gangue matter is not so tough and hard.

Raw cyaniding of sulphide ores has made a good deal of progress in the last few years and has been very successful in a number of cases. Cascade arsenical ores have been the subject of experiment here in Seattle in the laboratory and on a small practical scale and enough has been done to show that the thing is feasible in this case. An extraction of gold of 80 to 90 per cent. has been obtained and the estimated cost in a 100-ton plant is $1.50 a ton for operation. After cyaniding and washing

the ores can be roasted for arsenic. This roasting should not cost more than 50 cents per ton.

The third possibility is to roast the ore first for arsenic in a comparatively inexpensive plant at the mine and ship the roasted ores to the smelters for the extraction of the precious metals. This would obviate many difficulties at present encountered. The ore would be freed from nearly all the sulphur as well as their arsenic, which would result in a slight enrichment of the product, the arsenic could be marketed by the producer and the smelters would be eager to get the desulphurized and dearsenuretted product and would be willing to pay good rates for it.

Good returns await the company that has ore reserves large enough and the courage great enough to be the pioneer along these lines. Either of the two latter methods should be the subject of careful experiment on a small working scale before works of any size are built. Under competent direction tests can be made at a reasonable cost with results that will be reliable and of great benefit to the mine owner and the mining industry of this section.

CORRESPONDENCE.

FROM THE ANTIPODES.

Dear Sir,—

I have sent you, under separate cover, photos of the mineral section of the Canadian Exhibit. It is by far the largest and most complete collection of economic minerals here, and our installation is quite different from any of the other exhibits.

The exhibition was opened on the 1st of November by the Premier, Sir Joseph Ward, and his first official visit was to the Canadian Court. He was very much impressed with the extent of our mineral resources.

The general public are more interested in our exhibit of asbestos, mica, nickel and cobalt, these minerals being new to New Zealand.

I have not had time to visit the mining districts, but will do so later on, the Minister of Railways having given me every facility for doing so.

The attendance, so far, has been very good and there is every prospect of the exhibition being a great success. Up to date the number of admissions is over 517,000.

New Zealand is a delightful country and the people the most hospitable I have ever met. There is no doubt whatever but that the trade relations between Canada and New Zealand will be materially increased as a result of the exhibition.

I shall be pleased to send you my impressions of the different mineral exhibits here, also anything I may come across during my trip through the colony.

With best wishes for the New Year.

Yours very sincerely,

R. L. BROADBENT,

The Editor, Canadian Mining Review,
Montreal.

[We reproduce in this issue two interesting photographs that accompanied Mr. Broadbent's letter.—Editor.]

We are requested to state that all communications, mail and express matter to the American Institute of Mining Engineers, or the United Engineering Society Building, should be addressed to 29, West 39th Street, New York City.

EXPERIMENTS WITH COBALT ORES.*

By Henry M. Howe, LL.D., William Campbell, Ph.D., and Cyril W. Knight, B.Sc.†

(New York Meeting, April, 1907.)

This paper gives the results of an investigation of the behavior of the argentiferous cobalt-nickel arsenides of Temiskaming, Ontario, in roasting, made in the metallurgical laboratories of the School of Mines of Columbia University in the City of New York. The ore was kindly given by the owners of the La Rose and Trethewey properties at Cobalt, Ontario, and Mr. E. J. Hall, Tutor in Assaying in Columbia University, has helped us much.

I. Object of the Investigation.

The object of the investigation was to learn:—

1. The temperature at which the arsenic is most rapidly expelled;
2. The thoroughness with which it is expelled by prolonged roasting at this temperature;
3. The effect of adding charcoal (a) near the end of the roast and (b) at the beginning of the roast.

II. Nature of the Ore.

The important ores mined in the Temiskaming deposits are: native silver—with small amounts of dyscrasite (Ag_6Sb), argentite (Ag_2S), pyrargyrite (Ag_3SbS_3)—smaltite ($CoAs_2$), chloanthite ($NiAs_2$) and niccolite (NiAs). Mispickel (FeAsS) and cobaltite (CoAsS) also occur in smaller quantities. The average composition of the ore shipped from this district for the first six months of 1905 was: silver, from 4.1 to 4.8 per cent.; cobalt, from 6.9 to 8.2 per cent.; nickel, from 3 to 4.7 per cent.; and arsenic, from 30.9 to 34.6 per cent. The ore which we treated consists chiefly of smaltite. In our laboratory-work the temperature was kept below the melting-point of silver (960° C.) in order to prevent loss of that metal, though our preliminary experiments showed that these ores do not frit or clog at this or even at a somewhat higher temperature.

The Temiskaming ores contain little gold, only $0.40 per ton in case of the ores which we treated.

III. Sampling and Assaying.

About 43 lb. of the ore, in lumps about 3-in. cubes, were crushed so as to pass through a sieve of 20 meshes to the linear inch. In this crushing we caught and separated particles of metallic silver which represented about 75 oz. of silver to the ton of ore, or about 11 per cent. of its total value. Some of these particles were about 0.25 in. in diameter.

For assaying, a lot of 37 assay-tons was next separated from this crushed product by means of a "split" sampler, and then ground so as to pass a sieve of 100 meshes to the linear inch. In doing this a second lot of metallic silver particles, representing 117 oz. per ton of ore, was separated.

The results of 12 crucible-assays and 9 scorification assays were:—

	oz. per ton of ore
Metallic silver by the crucible process.....	477
Metallic silver by the scorification process. ..	497
Add metallic silver separated in crushing.. ..	75
Add metallic silver separated in grinding. ...	117
Total silver-content	689

The ore contains 56 per cent. of arsenic.

For the silver-assay the following quantities were used: For scorification, 0.2 A.T. of ore was roughly divided into halves, each of which was scorified with 60 g. of lead and 1 g. of borax-glass. The resulting two beads were weighed together. For the crucible process, 0.5 A.T. of ore, 2.5

* A paper to be read before the American Institute of Mining Engineers, April meeting.

† Respectively Professor, Instructor and Student of Metallurgy in the School of Mines of Columbia University in the City of New York.

A.T. of lead oxide, 2-3 A.T. of soda, 1-3 A.T. of borax-glass, and 4.5 g. of argol were used.

IV. The Roasting.

The roasting was done in an American Gas Furnace Company's oven, 27 in. long and 20 in. wide inside.

The ore was held in shallow iron pans resting on the hearth of this furnace, and lined with 0.5 in. of fire-brick.

The temperature was measured by means of a Le Chatelier pyrometer. The thermo-couple was protected from arsenic and other fumes by a porcelain tube, and was placed immediately above the ore. It entered through a circular hole in the back of the furnace and was connected with a Keiser and Schmidt galvanometer, standardized by means of the melting-points of zinc, aluminum and copper. The temperature was recorded and the ore rabbled every 10 min. In none of the roasts was any fritting or clogging of the ore noticed.

V. At What Temperature is the Arsenic Expelled Most Rapidly?

Roast No. 1.—In this test, 3.5 lb. of the ore, crushed to pass a 20-mesh sieve, were placed in the furnace, the temperature of which had previously been raised to 490° C. The temperature was then gradually raised at the rate of about 120° C. per hour, until it finally reached its highest point, 870°C. Samples were taken with the usual precautions, and their arsenic was determined by fusion with sodium peroxide, neutralizing with acetic and sodium hydroxide (using phenolphthalin as an indicator), precipitation as silver arsenate with silver nitrate, and titrating with ammonium thiocyanate.*

The results of the roast are given in Table I.

Though the arsenic escaped pretty rapidly at first, yet towards the end of the second hour its escape was almost completely arrested, in spite of the continued regular rise in temperature. But when the temperature reached 840°, the expulsion of arsenic again became rapid. These results tend to prove that the behavior of smaltite resembles that of pyrite, of which the first atom of sulphur is removed at a much lower temperature than the second.

*Miller's Quantitative Analysis for Mining Engineers, p. 114.

Conclusions.—1. That 15 per cent. of arsenic (per 100 of ore), i.e. 27 per cent. of the total arsenic, is expelled below 700° C.

2. That the rest of the arsenic is not expelled until the temperature reaches about 840°, when rapid expulsion again sets in.

VI. How Thoroughly Can Arsenic be Expelled at 890° C?

Roast No. 2.—In this roast about 3 lb. of ore, ground to pass a sieve of 20 meshes to the linear inch, were raised quickly to about 890° C. (a temperature a little above that which Roast No. 1 had shown that arsenic is rapidly expelled), and held near that temperature for about four hours, with frequent rabbling.

As shown in Table II, the arsenic was expelled fairly rapidly until it had fallen to about 20 per cent., but thereafter very slowly.

VII.—Does Charcoal Added after Roasting at 890° Cause Further Expulsion of Arsenic?

Roast No. 3.—In order to learn whether an addition of charcoal after long roasting between 840° and 890° C. (temperatures between which we had found that arsenic is expelled rapidly) causes further expulsion of arsenic by reducing the fixed arsenates to the volatile forms of arsenious acid and metallic arsenic, one of us roasted a third lot of ore at temperatures between 870° and 890° for 1.5 hr., and, without removing it from the furnace, he then stirred in 10 per cent. by weight of charcoal, ground so as to pass a sieve of 10 meshes to the linear inch, but not one of 20 meshes. The results are shown in Table III. If too coarse, charcoal disintegrates and scatters the ore, and if too fine it burns away too fast.

At the time of adding the charcoal, fumes of arsenic had ceased to be visible, but this addition caused a sudden evolution of dense fumes, which lasted for only a few minutes.

The charcoal had little effect on the arsenic. Before its addition the ore contained 15.8 per cent. of arsenic, and 1 hr. later this had fallen only to 15 per cent.

In this roast, after the ore had been exposed to a temperature above 856° for 1 hr. 40 min., its arsenic-content had fallen to 15.8 per cent., whereas in Roast No. 2, after it had been exposed 2 hr. to temperatures above 846°, it still contained 18.3 per cent. of arsenic. This difference tends to show that unnoticed variations in conditions may materially influence the rate of expulsion, as is the case in many roasting-operations.

The fact that the arsenic was expelled in this roast, before the addition of the charcoal, more thoroughly than in any of the others, in spite of the very rapid raising of the temperature at the beginning, goes to show that the behavior of smaltite differs in an important way from that of pyrite, the temperature of which must be raised very carefully and slowly, lest the fritting or enamelling of the outer surface of the individual particles prevent the free access of the air to their interior, and thus arrest the roast.

VIII.—Does Charcoal Added at the Beginning of the Roast Increase the Expulsion of Arsenic?

Roast No. 4.—About 2 lb. of ore were mixed with 10 per cent. by weight of charcoal, raised to 880° in 2 hr., and held near that temperature for 1.75 hr. more, or a total of 3 hr. 45 min. The charcoal seems to have had little effect, because at the end of this time the ore still contained 17.5 per cent. of arsenic, or more than in Roast No. 3 after it had been above 856° for 1 hr. 40 min., and but little less than in Roast No. 2 after it had been above 795° for 2 hr. 10 min.; and in each of these latter cases the expulsion of arsenic was brought about without the use of charcoal.

These cases are here recapitulated:—

Roast.	After Remaining Above	For	The Ore Still Contained
No 2	846° without charcoal.	2 hr.	18 3 per cent. of arsenic
No. 3	856° without charcoal.	1 hr. 40 min.	15.8 per cent. of arsenic
No. 4	880° with charcoal.	1 hr. 45 min.	17.5 per cent of arsenic

IX.—Does Finer Grinding Increase the Expulsion of Arsenic?

Roast No. 5.—In order to learn whether finer grinding would lead to further expulsion of arsenic by exposing the ore more fully to the air, the ore which had already undergone Roast No. 3 was re-ground so as to pass a sieve of 100 meshes to the linear inch, and re-roasted for 2 hr. 30 min. at about 880° C.; but this re-roasting caused no farther expulsion of arsenic.

X.—Summary of Results.

The following conclusions apply only to the particular ore here treated:—

1. The percentage of silver as determined by the scorification-method is about 4 per cent. higher than as determined by the crucible-method.

2. The ore neither clogs nor frits at or even somewhat above 960°, the melting-point of silver.

3. The arsenic can be reduced from about 56 to 41 per cent., or by 15 per cent., by roasting below 700° C. (Roast No. 1, Table I.).

4. It can be further reduced by about 24 per cent., viz.: —to 17 per cent., by roasting at temperatures above 840°, and in this higher range the arsenic is removed much faster than at lower temperatures. (Roast No. 2, Table II.).

5. Hence our inference that the behavior of smaltite in roasting is probably analogous to that of pyrite, which loses its first atom of sulphur much more readily than its second; yet, unlike pyrite, this ore may be raised suddenly to 800° without harm, because, unlike pyrite, it does not frit or enamel when thus suddenly heated, but remains open and porous, so that the air may penetrate it. (Roast No. 3.)

6. Charcoal, whether added at the beginning or towards the end of the roast, fails to increase the expulsion of arsenic. (Roasts 3 and 4.)

7. We doubt whether it will pay to reduce the arsenic-content below 20 per cent.; even by roasting at temperatures above 890° C., because its further reduction is very slow.

A NEW MINING ASSOCIATION.

The Hastings (Ont.) Mining Association has been incorporated with the following members:

Mr. W. A. Hungerford, Vice-President of the Atlas Arsenic Co., was unanimously elected President.

Mr. Arthur Coe—1st Vice-President.

Mr. E. B. Davies—2nd Vice-President.

Mr. S. Wellington—3rd Vice-President.

Mr. D. Gillen—Secretary.

Mr. R. T. Gray—Treasurer.

The Vice-President, in his address at the organization meeting held in Madoc, spoke as follows:

I can assure you I consider it a very great privilege to have this opportunity to speak to you this evening on a question that is of the deepest importance to this section of Ontario and this county in particular. We have met here to-night for the purpose of organizing two associations, both with the same object in view, the welfare of the community. And I do not think there is a gentleman here to-night, but is heartily in accord with the object of this meeting. I am not intending to speak altogether in the interest of the Board of Trade, only that I sincerely hope you will be successful in forming such an organization as at this time, more than at any other time in the history of Madoc, such an organization should be formed. But I would like to say a few words in behalf of the mining interest of Eastern Ontario. As we, the miners of this section, feel that the present mining laws and regulations are not adapted for this section, and that the legislation that has taken place is all based in the interest of the Cobalt section, and not for the older portion of the province. And we feel separate legislation should be made, so as to meet the wants of the eastern district. The conditions existing in this section, and the Cobalt section, are so far apart that the same laws and regulations cannot govern both districts satisfactorily. We also feel that nothing has yet been done by the present Government that has benefited in any way this portion of Ontario, not that they wish to discriminate against this section, but from their want of reliable information regarding our wants. And we feel that representation should be made to the Government, so that we may have our rights. This county is the premier mining county in Ontario, in fact, I might say in Canada. And although Cobalt is immensely rich in silver and we hope also in gold, yet as a matter of fact, there is as much or more wealth in sight at the present time in Eastern Ontario and in this county, than Cobalt will ever produce, and when Cobalt has gone the way of all such mining camps, Hastings district cannot fail to be a flourishing mining centre. I do not make this statement out of any doubt about the richness of that section, but I make it from the facts connected with our county. In the first place Cobalt, we know, has some enormously rich silver mines, but in that alone consists her wealth. When they are worked out nothing will be left. Now, what has this district got. In the first place, we have more arsenical ores in the County of Hastings and Addington, than can be found in any other country in the world, and with capital to develop their deposits, we could produce enough arsenic in this district alone to supply the world's demand. And I make this statement knowing what I say to be the fact, that in no part of the Dominion of Canada can such views of auriferous free milling quartz be found as in this county. In the northern part of these townships you can see veins from fifty to two hundred feet wide. At the Craig mine in Tudor there is a vein over three hundred feet carrying free gold. True, the ores are low grade, but all high enough to pay if worked on a large scale. Then there are iron deposits in every township in North Hastings, and no finer iron can be found in the Dominion than in some of the best iron deposits. Look at the mines at L'Amable, owned by Mr. Farham, for which he refused $2,000,000 within the last month. And what about our pyrites? In what part of this continent can they be found in such abundance as in this district. See what the Nickle's Co., of New York, are doing in the township of Hungerford—erecting a plant at a cost of over one million dollars, to treat the products of their own mines. Then we have copper. See what Col. Saunders has been doing with his copper smelter at Eldorado, and Mr. Cushman at Bannockburn, with his lead smelter. And besides these ores we have talc, soap-stone and marbles of every shade and color, sandstones, feldspar, mica, asbestos, actinolite, corundum, cobalt, plumbago, flourspar, lithographic stone, molybdenite zinc, sodalites, celestite, marells, antimony, barite, apatite, fowlerite, and pyrrhotites, besides quarries of granites, gneiss, slate and lime stones. And it is because we have these minerals that we feel some sort of assistance should be given, and we hope that this association will be the means to bring this district more prominently before the public. The question has been often asked why our gold mines have not paid. The question is easily answered. In almost every case it has been the want of money, the want of experience, the want of development, and the cost of power. This is not a poor man's country, it requires capital to develop our mines, and the ores must be treated in large quantities, With two exceptions the largest mills in this district are ten stamp mills. As a rule our ores will not go over $4.50 to $5.50 per ton, although these exceptions in gold, which even with ten stamp mills would pay well, provided we had cheap power. When I tell you that it cost the Gold Fields Co. in the neighborhood of $35,000 to $38,000 per year for fuel, over $80 per horse-power per annum, and the Atlas Arsenic Co., when working the Gawley shaft over $20,000 per year with only a ten-stamp mill, you can have some idea of where the profits go, but now that the Government has taken up the power question, there is no reason if we can get the power at a reasonable cost, but that any one of our gold mines will pay. Of course, we who are in the arsenical district are not depending on the gold product alone, as we have the arsenic as a paying product, and there is every reason to believe that the arsenic mine will be in full blast next summer, provided arsenic holds its present price. Two years ago arsenic was sold in New York at $60 per ton. Now it is worth from $140 to $160 per ton. With our supply of arsenical ores, and the fact that in England where the main supply came from, manufacturing arsenic is a thing of the past, on that account there is good reason to believe that the eyes of capitalists will be directed to this district. In fact, they have got to, as with our gold product which our mispickle ores contain, we can manufacture arsenic

at a cost of $40 less per ton than they could do in any other country. It has also been said by skeptics who know nothing about the conditions of this section, that our pay ores do not continue with depth. I defy any one to show any truth in this statement. The fact is, that in every instance better values are found in the lower workings than on top. It is quite true we have no deep mines. The deepest shaft is on the Gold Fields' property at Deloro, which is in the neighborhood of 500 feet. The ore at this level is richer in arsenic and in gold, than was ever found on top. The same applies to the Cordova at its 400 feet levels, and also at the Gawley and Atlas arsenic mines, as well as at the copper mines at Eldorado, and lead mines at Bannockburn; also the Craig Co. mines in Tuar, and the richest and largest bodies of ore at the Nickle's property in Hungerford township, were found at these present workings between three and four hundred feet, and there has never been an instance on record where a true vein has pinched out in this section; so I may say that any statement of that sort is utterly misleading and untrue. Now, gentlemen, what do we want from the Government? We ask from the Dominion Government that no bounty be paid on pig iron which is smleted in part or in whole from American ores, but that a bounty be paid on iron manufactured from Canadian ores. That there shall be no duty on coal when used for smelting purposes. From the Ontario Government we ask that there shall be no licenses required for prospecting either on Government or private lands in this district; that the mining license system be done away with; that there shall be no bounties on gold ores that do not pay over $20 per ton. We also want that a full list of all the Government lands be placed in hands of the clerks of each township in this district where mine lands exist, so that those wishing to prospect Government lands may know the lots owned by the Government, and we ask that a tax of not less than 20c per acre shall be paid by owners on the mineral rights of properties who do not own the surface rights, and who are not working the properties. As you are aware, in this section thousands of acres are held by speculators who buy up these lands at tax sales. Selling the surface rights and holding the mineral rights for speculative purposes. By doing this the municipalities will get the benefit of this revenue, and they will either have to sell their properties at reasonable figures, or contribute to the revenue of the country. We would also ask the Government that an appropriation be made each year for assisting to build roads to mines that are situated in the unsettled parts of the county. We would also ask that assistance be given or a bounty paid for establishing reduction work for the treatment of pyrite ores, so as to encourage this industry in this section, where there are so many undeveloped pyrite properties. These questions with others on the same lines I hope will be brought up at our future meetings, and I am confident with our united efforts, we can show investors that there is no better field for investment than in this section.

QUEBEC'S MINING AREA.

The following communication has been received:

"While the Province of Ontario is selling the beds of Cobalt lakes for millions in cash, and so forth, the Province of Quebec is permitting speculators to take up vast blocks of the public domain, under "mining license," at five dollars a square mile. Recent discoveries in the Lake Chibougamau district have made it about as certain as anything in regard to mining can be, that this country is going to be a rich mining one, although the public has hardly realize that this is the case, and that we have in our own province a mineralized area, which, if it were served by a railway, would make Cobalt look like a pawnbroker's shop after a pledge sale. Already there is not an acre of rock or swamp in that district that a free prospector can go in on, for ten miles, at least, around Paint Mountain. When the railway is built, as built it must be in the near future, the prospectors must buy the rights to prospect from the gentlemen who hold the mining licenses, not from the province, and the minerals, when found, must be bought, not from the province, but from the same fortune miners, who mine by taking up blocks of, say, ten square miles by getting four lines drawn on an imaginary map, and paying fifty dollars. All this is to be the more regretted because the discoveries in the Chibogamoo district seem to be of such a nature as to lead to the belief that a very profitable, and what is better, a permanent mining industry will in time be established there. Free prospecting cannot now take place, and the indispensable railway cannot now be built with any hope that the mineral discoveries will recoup the expenditure, as must have been the case already in Ontario; for the returns from Cobalt (including the fees on company flotations), must have gone a long way towards paying for the Temiscaming Railway. One thing is certain, the mineral areas in the northern part of this province must be opened up by a railway, and that immediately. How it is to be done is a matter for the Government to decide. It has granted the licenses; it must face the music and the organ men it has fed so splendidly.

"QUEBECKER."

THE COBALT CAMP OUTPUT.

Cobalt ore shipments during the month of January, 1907. Period January 1st to January 12th, 1907:—

Jan. 3, G.T., 21,631, Buffalo Mine to Chas. L. Dennison, Perth Amboy, N.J., 59,000 lbs.

Jan. 4, G.T., 4,673, McKinley, Darragh, & Savage Mining Co. to Balback Smelting & Refining Co., Newark, N.J., 60,000 lbs.

Jan. 7, G.T., 7,802, Coniagas Mine to American Smelting & Refining Co., Perth Amboy, N.J., 62,700 lbs.

Jan. 7, G.T., 9,037, Coniagas Mine to American Smelting & Refining Co., Perth Amboy, N.J., 54,800 lbs.

Jan. 9, C.P., 44,838, Green Meehan to Canada Copper Cliffe, Ont., 61,210 lbs.

Jan. 10, P.R.R., 14,681, O'Brian Mine to American Smelting & Refining Co., Perth Amboy, N.J., 103,000 lbs.

Jan. 10, G.T., 29,806, Nipissing Mining Co., Nipissing Mining Co., New York, N.Y., 40,100 lbs.

Jan. 11, Soo, 25,386, O'Brian Mine to Canada Copper Co., Copper Cliffe, Ont., 64,866 lbs.

Jan. 12, Soo, 18,498, O'Brian Mine to Canada Copper Co., Copper Cliffe, Ont., 64,795 lbs.

Period January 20th to January 26th, 1907.

Jan. 21, N.D., 20,596, O'Brian Mine, Canada Copper Co., Copper Cliffe, Ont., 60,570 lbs.

Jan. 21, G.T., 6,142, Coniagas Mine to American Smelting & Refining Co., Perth Amboy, N.J., 56,720 lbs.

Jan. 21, C.P., 40,870, Cobalt Townsite Mining Co. to Orford Copper Co., Copper Cliffe, Ont., 47,160.

Jan. 22, G.T., 27,309, Buffalo Mine to Chas. L. Dennison, Perth Amboy, N.J., 40,000 lbs.

Jan. 23, G.T., 2,311, Nipissing Mining Co. to Nipissing Mining Co., New York, N.Y., 41,730 lbs.

Jan. 23, L.V., 8,953, University Mine to University Mine, c/o Leeoux Co., New York, N.Y., 61,385 lbs.

Jan. 23, C.P., 24,558, Cobalt Silver Queen Mining Co. to Canada Copper Co., Copper Cliffe, Ont., 38,860 lbs.

Jan. 23, C.P., 147,942, Cobalt Silver Queen Mining Co. to Canada Copper Co., Copper Cliffe, Ont., 86,823 lbs.

Jan. 24, G.T., 25,479, Nipissing Mining Co. to Nipissing Mining Co., New York, N.Y., 40,400 lbs.

Jan. 24, G.T., 24,135, Nipissing Mining Co. to Nipissing Mining Co., New York, N.Y., 42,047 lbs.

Period January 28th to February 2nd, 1907.

Jan. 29, G.T., 3,413, Nipissing Mining Co. to Nipissing Mining Co., New York, N.Y., 60,460 lbs.

Jan. 29, G.T., 13,453, Nipissing Mining Co. to Nipissing Mining Co., New York, N.Y., 60,394 lbs.

Jan. 30, G.T., 14,413, Nipissing Mining Co. to Nipissing Mining Co., New York, N.Y., 61,450 lbs.

Jan. 30, G.T., 28,886, Buffalo Mine, American Smelting & Refining Co., Perth Amboy, N.J., 40,000 lbs.

Feb. 1, G.T., 25,365, Nipissing Mining Co., Nipissing Mining Co., New York, N.Y., 40,180 lbs.

Making a total for this period of 262,484 lbs.

CANADIAN MINING INSTITUTE, ANNUAL MEETING.

The Ninth Annual Meeting of the Canadian Mining Institute, will be held at the King Edward Hotel, Toronto, on March 6th, 7th and 8th, 1907.

The usual single fare rate will obtain over all Canadian transportation lines.

The King Edward Hotel also offer a special reduced rate for members and others attending the meeting.

An interesting programme of papers has been arranged.

Members will be good enough to notify the Secretary as early as possible of their intention to attend.

The Nominating Committee submit, (in accordance with Par. XXVII., Sec. V, of the By-Laws), the following list of nominations to offices falling vacant at the end of the next Annual Meeting.

President—Mr. Frederic Keffer, M.E., Greenwood, B.C.

Vice-Presidents—Dr. J. Bonsall Porter, Montreal, Que.; Mr. W. G. Miller, Toronto, Ont.; Mr. W. Fleet Robertson, Victoria, B.C.

Secretary—Mr. H. Mortimer-Lamb, Montreal, Que.

Treasurer—Mr. J. Stevenson Brown, Montreal, Que.

Council—Mr. E. W. Gilman, Montreal, Que.; Mr. Jas. McEvoy, Fernie, B.C.; Mr. Frank B. Smith, Edmonton, Alta.; Mr. R. W. Brock. Ottawa, Ont.; Mr. J. C. Gwillim, Kingston, Ont.; Dr. F. D. Adams, Montreal, Que.; Mr. H. E. T. Haultain, Craigmont, Ont.; Mr. David H. Browne, Copper Cliff, Ont.

BOOK REVIEWS.

Bulletin No. 28 of the Institution of Mining and Metallurgy, London, E.C., England, has been received. It is replete with papers of interest to mining engineers and metallurgists.

The production of gas, coke, tar and ammonia during 1905 in the United States is given in a pamphlet just issued by the United States Geological Survey. The author is Edward W. Park.

"Land Smelting and Refining, with Some Notes on Lead Mining," is the title of a work that has been issued from the press of the Engineering and Mining Journal, New York. It is a reprint of various articles pertaining, especially, to the smelting and refining of lead together with a few papers bearing on mining of lead ore, taken from the pages of the Engineering and Mining Journal, together with others that have appeared in the Transactions of the American Institute of Mining Engineers. The editing has been done by Dr. W. R. Ingalls, whose intimate acquaintance with this branch of metallurgy, is, of course, well known. The book will be found a most useful work of reference by those having to do with either the smelting, refining or mining of lead ore. The price is $3.00.

The following reports and catalogues have been published by the Geological Survey since January 1, 1906:—

No. 913. The Mineral Pigments of Canada. By C. W. Willmott ((pp. 39). Published February 18, 1906.

No. 914. Supplementary List of Publications during 1904 and 1905 (pp. 11). Published February 20, 1906.

Mineral Production of Canada for 1905 (pp. 16). Published March 15, 1906.

No. 939. Preliminary Report on the Rossland, B.C. mining district. By R. W. Brock (pp. 40). Published June 2, 1906.

No. 923. Report on Chibougamau mining region. By A. P. Low, (pp. 61).

No. 940. Report on Graham Island, B.C. By Dr. R. W. Ells (pp. 46). Published July 20.

No. 888. The Geology and Petrography of Mount Yamaska. By G. A. Young, forming Pt. H. Annual Report, Vol. XVI (pp. 43).

No. 955. French edition of 923 (pp. 57). Published August 2.

No. 947. Summary Report of the Acting Director, for 1905 (pp. 144). Published August 31.

No. 950. Palaeozoic Fossils, Vol. III., Part IV. (and last). By J. F. Whiteaves (pp. 208). Published October 10.

No. 956. Catalogue of Publications (pp. 129). Sent to printer June 11. Signed for printing September 21. Published October 12.

No. 907. Annual Report (New Series), Vol. XIV. (pp. 1193).

No. 911. Annual Report (New Series), Vol. XV., (pp. 1025).

No. 905. "Cruise of the Neptune." By A. P. Low (pp. 355). Published November 19, 1906.

No. 928. Section of Mines, Annual Report, 1904.

The following reports are going through the press:—

No. 902. Report of Brome Mountain, Que. By J. A. Dresser.

No. 942. Report on the Upper Stewart River, Yukon. By J. Keele, and

No. 943. On the Peel and Wind Rivers, Yukon. By C. Camsell.

No. 952. Annual Report (New Series), Vol. XVI., (pp. 733).

No. 958. Annual Report on Chemistry and Mineralogy. By G. C. Hoffmann.

No. 949. Cascade Coal-field. By D. B. Dowling.

No. 961. Reprint of Report on Nickel and Copper Deposits of Sudbury district, Ont. By Dr. A. E. Barlow.

No. 962. Reprint of Report on the Nipissing and Timiskaming region, Ont. By Dr. A. E. Barlow.

The British Columbia Bureau of Mines has issued Bulletin No. 1, 1906, describing the mineral claims on the West Coast, and in the vicinity of Great Central Lake, Vancouver Island. It was written by the Provincial Assayer, Mr. Herbert Carmichael. The groups described are those of the June, and Yreka, and the hematite ore deposits of Quatsino Sound; the Marble Quarry, Stormont, Glengarry, and Texas, on Nootka Sound; Hesquiat Harbour, Indian Chief, and Prince Group on Sidney Inlet; Ormond, near Matilda Creek, Pete and Iron King, Copper King, Nos. 1, 2, and 3 and Ormond No. 2, near Ahousat; Good Hope, Killapa, American Wonder, and Hetty Green, of Clayoquot Sound; Red Rover, Enterprise, Sarita Group; Cascade Southern Group; Happy John Group; Monitor, The Nahmint, Gladys and Edith Group; on Barkley Sound. In addition, the Great Central Lake district is described. It is reached from the town of Alberni by waggon road, 12 miles long; the lake being 200 feet above the sea.

The general trend of the lake is east and west, and it is about twenty-five miles long by a mile or so wide. At its western end two creeks flow in, heading from mountains still farther west. A trail from the lake follows the most northerly of these creeks on a gradual ascent for a distance of ten miles, until it ends in a basin, shut in by high mountains, the basin having here an elevation 1,500 feet above the Great Central Lake, or 1,700 feet above the sea. To the south a precipitous bluff rises 2,075 feet high, from which pours a considerable stream of water that barely touches the rocks until it reaches the bottom, breaking into a mass of spray in its descent. The ascent of the bluff requires stout muscles, and the aid of the small bushes which cling so tenaciously to the clefts in the rock. On the top there is a small rocky plateau, or basin, enclosing a lake about half a mile long by a quarter wide, the elevation of the lake being 3,350 feet above the sea. The mountain lake, situated in the heart of Vancouver Island, with snow-clad mountains rising 2,000 feet above it, and the blue crevassed glacier of the "Nine Peaks" showing up to the south in the morning sun, forms a beautiful scene.

Big Interior Group: This group consists of seven claims, viz.: Big Interior, Nos. 1 to 7, and was located by Drinkwater and Nicholls, of Alberni. The claims are reached from the head of the small lake referred to, by

following up a small second basin, about a quarter of a mile. The head of this second basin is hemmed in on three sides by precipitous cliffs a thousand feet high, on which rests a snow cap, terminating in peaks which are 2,000 feet above the lake below. Practically, this entire face, some 4,000 feet wide by 1,000 feet high, shows the strong red color due to iron stain, while at the base there are thousands of tons of the same rock which have been mined by the action of elements. A closer examination shows this cliff to be a granitoid rock, mineralized with copper pyrites, pyrrhotite, and pyrite in varying proportions, some zones showing strong mineralization, while in others it is more sparse. To the west the rock assumes a brecciated structure and has been cemented together by a filling of calcite, with a considerable impregnation of copper carbonates, and into this zone a tunnel has been driven a distance of 31 feet. The ascent of the bluff is somewhat dangerous, owing to the rather precarious foothold, and the absence of vegetation, the top being reached at an elevation of 1,375 feet above the small lake. From the top of the bluff a snowslide was followed until a further elevation of 500 feet was reached, at which point the ore is uncovered, and shows the strongly mineralized granitic mass which is seen to penetrate a nearly horizontal strata of limestone, alternate bands of which continue to the top of the mountain 500 feet still higher. This sharp ridge, with its altitude of 5,700 feet, may be considered as the backbone of Vancouver Island, shedding the water to the south down the Alberni canal, to the northeast down Buttle Lake and the Campbell River, and to the west of Bear River into Clayoquot Sound.

The mineralized zone, showing in the face of the cliff to the north of the basin, and forming the great mass of low grade mineral on the property, is so large, so inaccessible, and the mineralization so scattered, that it would be impossible to obtain anything approximating an average general sample of the exposure without the expenditure of an amount of time and money not justifiable under the circumstances. However, at the foot of the cliff, there is a talus extending the whole length or width of the mineralized zone, made up of material broken away from the whole face of the zone in question. While this talus may to a certain extent have been affected by weathering, it still may be considered a very approximate sample of the inaccessible cliff. Samples were taken from this talus, from which it is judged that approximately the central portion of the mineralized zone will assay from ½ to 1 per cent. copper, with 1½ to 2 oz. silver per ton, and a trace of gold. These values extend over a width of about 1,500 feet, while to the right of the mineralization gradually fades off into the country rock.

To the left of the mineralized zone is what has been called, for purposes of designation, the "brecciated zone," and which is merely a continuation, to the left, of the mineralized zone which has been subjected to a crushing due to movement and in which the interstices between the fragments of the rock have been filled with secondary minerals, chiefly calcite, with some carbonate of copper, forming a secondary enrichment. This secondary enrichment has taken place, as would be expected, along defined channels, producing streaks of higher grade mineralization often forming commercial ore. Here, again, no general sampling was possible; although a tunnel has been driven for some 31 feet into the bluff, it was found impossible to examine the face of the cliff for 10 feet on either side of the tunnel mouth.

The mineralization just described, and which forms the great bulk of visible mineralization on the property is admittedly very much diffused through the rock, and is consequently so low grade as to be of value only if found to be amenable to some form of concentration, and of which there seems to be a fair probability.

On the top of the mountain, is an area in which the mineralization seems to be more concentrated, producing, in places, ore of a grade to stand transportation and treatment charges. This higher grade ore appears to occur along the lines of contact of alternating bands of granitic rock and limestone. The extent of the latter deposit it was found impossible to determine, as the ore was found to be covered in most places by a heavy capping of gossan, and in many places seemingly permanent snow and ice covered up the formation. While the future of the property is far from being proven, the very great extent of the mineralization, with occasional concentrations, certainly renders the proposition worthy of most careful investigation and prospecting.

Della and Glacier: These claims are situated on the small lake in the Big Interior Basin, and are owned by Drinkwater and Engvik. On the claims is a small quartz vein from 2 to 3 feet wide, mineralized chiefly with arsenical iron. Assays of the straight ore gave the following result:—Gold, 5.12 oz. per ton; silver, 5.2 oz. per ton; copper, 1.0 per cent. The vein has not yet been worked to any extent, but an attempt has been made to extract the values by roasting the ore and grinding in an arastra, which has been erected and is being run by a small waterwheel constructed on the ground.

An examination of the different properties on the west coast of Vancouver Island, especially those on which extensive development work has been done, would point to the following theory as to the mode of ore deposition.

The properties, with the exception of those in Quatsino and Great Central Lake, present nearly identical conditions. The mineralization occurs in or close to diabase dykes. Sometimes there is sufficient quartz in the fissure to make a quartz vein, but more often there is an entire absence of quartz, the vein-matter being the crushed material of the dyke. There appears to have been two periods of movement, the first in which the dykes have formed, when no mineralization took place; the second period in which these dykes were scattered and twisted, when probably secondary dykes of a similar composition to the first series were injected into the fissures found by the movement.

A careful examination of these deposits would lead one to the conclusion that mineralization took place at this time, not as a secondary enrichment, but as a direct deposit by ore-bearing solutions from below. The solid mineral is seen to penetrate what were originally cavities, and to follow along old slip-walls, inside of which, as a rule, no mineral whatever is seen, as would be the case if segregation had occurred. The deposits are often brecciated structure, the ore enclosing fragments of the original dyke-rock, and only occasionally is it seen forming a part of the dyke, and then it would be accounted for as forming part of the second upheaval when the later dykes were formed. Mineralization is found along fractured zones in these diabase dykes, and where these fractures contained cavities for the entrance of mineral-bearing solutions we now have ore-bodies, but where the ground is tight or shows only slight movement little or no ore is found.

Chalcopyrite froms the principal mineral of value, while pyrrhotite is a common mineral, occurring both massive and mixed with pyrite and chalcopyrite, but carrying little or no value in itself. Arsenopyrite occurs in any of the properties, and, as a rule, carries gold values.

While no geological map or extensive examination of this region has been made, the general country rock outside of the mineralized zones appears to be syenite, occurring often as mountains of great size and connected with a series of feslpathic dykes which penetrate the older rocks.

PERSONALS.

Mr. A. A. Talmage has become associated with the Pittsburg-Salt Lake Oil Company, his headquarters being in the Chamber of Commerce Building, Los Angeles, California.

On the evening of January 30, a supper was given to Mr. W. A. Duff, assistant manager of the Canadian Westinghouse Company, Limited, on account of his leaving Montreal to take the position of manager of the Canadian Westinghouse Company's office in Winnipeg.

On Feb. 6, about 60 or 70 members of the Ontario Legislature visited the School of Mines at Kingston, going by special train from Toronto. The School of Mines has asked for an increased grant, and the management were desirous that the members should see the work being done.

Mr. Robert R. Hedley, M.E., has resigned his position of manager of the smelter of the Hall Mining and Smelting Company, Ltd., Nelson, B.C.

Thomas A. Nevins, head of the banking firm of Thomas Nevins & Son, and a party of New York, Philadelphia and Pittsburg capitalists, have been in Cobalt inspecting properties.

Samuel Newhouse, E. P. Earl, W. B. Thompson, and Eugene Meyer, who have been inspecting the Nipissing properties, returned to New York at the beginning of the month.

Col. J. H. Robeson, a mining man of Denver has been secured by President Newhouse as manager of the Nipissing property.

Dr. J. J. Deadman, manager, and Fred. R. Price, secretary of the Abitibi Mining Company, have been in Toronto.

Mr. Geo. S. Wynne has been appointed acting general manager of the Lake Superior Corporation in place of Mr. Sawyer, who has returned to Pittsburg.

MINING NOTES.

A French writer says :—All the known deposits of platinum are becoming exhausted, and the price is going up to a prohibitive extent. In 1876 the metal could be bought for $100 the kilogramme. Four years later it had doubled; in 1901 it had quadrupled, and to-day the price is $1,200 per kilogramme, or twice the price of gold. Even that is for crude platinum. The worked metal is twice as dear again. Considering how many industries are now absolutely dependent upon platinum, the question of replacing it by some really efficient alloy or combination is acquiring vital importance.

NEWFOUNDLAND.

Valuable copper mines, covering an area of nearly a square mile, and situated at St. John's, Nfld., were a few days ago purchased from Messrs. Kawaja Bros., and the other two shareholders, by Mr. T. H. Ryan, representing a number of New York capitalists. The purchase price was $75,000. Sir E. P. Morris, of St. John's, who represented the North Sydney shareholders, transacted the deal. The property is said to be the most valuable of all the many copper areas in the Ancient Colony.

NOVA SCOTIA.

The development work which has been going on at Barrachois for the past few months has resulted in the exposure of an eighteen foot seam of iron ore. The operations have been carried on under the direction of W. F. Jennison, C.E., who leased the areas some months ago.

Samples of the ore were sent to Sydney Mines for analysis. The report from there was that the ore was of an A1 quality, and suited for the purpose of mixing with the Wabana ore in the manufacture of Bessemer pig.

QUEBEC.

Our esteemed contemporary, the Gazette of Montreal, had an editorial on Superintendent Obalski's report for 1905, in its issue of January 31. Better late than never. Yet the readers of the Mining Review read a resume of it in our July issue. The Gazette was more belated than the report.

ONTARIO.

Mr. E. J. Donn has been around Larder Lake for years. Mr. Donn states that about 1,500 persons are now living around the lake, and that about 2,000 claims have been staked.

Native silver is said to have been found forty miles up the Montreal River, in a location about twenty miles distant from Cobalt. It is stated that, in view of this find, the possible silver-bearing lands will be included in a block about twenty miles square.

Mr. Aubin, M.P.P. for West Nipissing, is authority for the statement that there is considerable activity in copper mining around Sturgeon Falls. Prospectors are going in by the dozen and rich veins are being discovered. A short time ago an area of some 480 acres was sold for $300,000.

This week we are able to announce the formation of the "Hugo Von Hagen Exploration Company," with an authorized capital of fifteen million dollars, being divided into three million shares of five dollars each, three-fifths of which are treasury stock, says the Wabigoon Star. This company has secured 51 per cent. of the stock of the Laurentian Gold Mines, Ltd., besides controlling interests in various other incorporations.

Mining Recorder Smith at Haileybury says remarkably rich specimens have been shown him as coming from Larder Lake.

From what can be gathered of the district generally, it would appear that it holds possibilities of becoming an important mining camp. Whether its future is good or bad, there is no doubt but that the district will be invaded this coming summer by a large number of prospectors.

A company has been organized to operate a mine discovered some time ago along Sturgeon Lake, in the Sturgeon Lake gold field district. The mine is reached from St. Ignace, and is 150 miles west of Port Arthur. The company will be known as the Douglas Mining Company, and will have a capital of $500,000. The directors will be Messrs. G. S. Gzowski, John Douglas, J. A. Gaggett, Geo. Laird, Toronto, and James Atwood, of British Columbia.

For the year 1906 the revenue of the Ontario Bureau of Mines reached a total of $250,090. This sum included the first royalty ever collected by the province from those engaged in the development of mineral deposits. This payment, amounting to $15,000, was made by the holders of the O'Brien mine, on a carload of ore shipped in 1905, subject to the outcome of a lawsuit then pending. Later the action was abandoned, and the O'Briens agreed to pay a royalty of 25 per cent. of the value of the ores mined. The aggregate also includes the sum of $108,500, the 10 per cent. payment made on the acceptance of the tender for the purchase of Cobalt Lake. Miners' license fees netted the province $70,000.

In 1905, the receipts reached a total of $61,560, while the appropriation made by the Legislative Assembly for the Bureau of Mines, including salaries for the staff in the office and in the field, and a vote of $25,000 for work in the Gillies limit, was $86,950. The revenue thus exceeds the year's expenditure by $163,140.

At the annual meeting of the Nancy Helen Mines Company, Messrs. W. R. Smyth, M.P.P., Wm. Black, and J. F. Black were respectively re-elected president, vice-president and secretary-treasurer. The reports presented were of a most satisfactory nature. Some work has been done on the 40-acre claim in Bucke township, owned by the company, and it gives promise of being a fine mining property. On the company's mine in the town site of Cobalt work has been and is being steadily continued. This property is numbered among the shipping mines of the district. A shaft has been sunk 82 feet and three carloads of ore are now awaiting shipment. A plant and

Westinghouse Exhibit at St. Louis.

equipment costing $20,000 is being installed, in fact, some of it is already in place. Several new and most promising veins have been discovered on this property quite recently, besides those now being worked. Among mining men in the Cobalt district the company's properties stand high and there has been considerable inquiry of late as to whether the company will make a public issue of stock. The company, it is said, intends to adopt this course some time in February.

A new mining district in Northern Ontario, which threatens to rival the far-famed Cobalt camp, is opening up in the Sutton Bay country, situated in Harris Township, lying eight miles east and one mile north of the town of New Liskeard. The new camp is commonly called the Casey mountain range, and at the present time of writing the showing prognosticates wonderful things for the future of the Casey mines.

The Casey mountain region is identical with Cobalt in formation. The same lower Huronian conglomerate with diabase contact is found to permeate the district, which lies on the edge of a swamp or the former level of Lake Temiskaming in pre-historic times.

The mountain range rises to a considerable altitude and runs east one and one-half miles, and has all been claimed. Native leaf silver in fairly large quantities has been found, and the two mining companies already operating are very much encouraged and expect to run into pay ore within a short time.

The companies operating are the Cobalt Silver Crescent Mining Company and the Bucknell Mining Company. The Silver Crescent Company is in charge of Herbert Murray, a mining engineer of large and varied experience, which has been gathered in California and at Nome, Alaska. Mr. Murray is of a conservative temperament, but even this trait does not prohibit him talking enthusiastically regarding the future of the Casey mountain range. At present the Silver Crescent Company has fifteen men working on the claim, busily engaged in cross-cutting and sinking a shaft to catch several veins of great promise. The several fissures are 4 or 5 inches wide, and carry cobalt ore and native silver. The decomposed cobalt bloom on one of these veins is as fine, if not better, than any in the Cobalt district farther south. The Silver Crescent Company has a nicely equipped camp, and in the early weeks of spring, machinery will be established for working the mine. The Cobalt Silver Crescent Company has a capital of $500,000, divided into dollar shares, and Pittsburg magnates are largely interested in the proposition.

The Bucknell Mining Company, next to the above claim, is working twenty-five men. They are just now erecting an engine and boiler-house, preparatory to establishing an up-to-date plant. A shaft has been sunk 40 feet on the property, and drifting from this centre 60 feet has transpired. The vein followed has a good showing of smaltite, or cobalt, ore and native silver, and recent assays promote confidence for the future in a large measure.

The Casey mountain range is two and one half miles from White River, a waggon road making transportation easy and quantities of wood and water abound for mining purposes.

COBALT.

The last car shipped from the Foster mine will, it is said, run over $58,000. "This is the richest yet shipped," says General Manager Adler.

It is rumored on the street that the negotiations in connection with the amalgamation of the Peterson Lake Company and the Nova Scotia are about completed.

The Nancy Helen Mines Company, which owns forty acres in Bucke Township, reports that a shaft has been sunk 82 feet, and that three car loads of ore are ready for shipment. A plant costing $20,000 is being installed.

The Coniagas people have commenced work on a 5x7 shaft in the Imperial Bank lot opposite the Prospect Hotel. There is known to be under the butcher shop to the north an important vein of ore, and it is the intention of the Coniagas to crosscut to this.

It is reported that McKinley-Darragh-Savage has declared a dividend of 2c monthly, equivalent to 24 per cent. per annum, on its 2,500,000 shares of $1 par value. No official announcement of a dividend has, however, yet been made, and local interests say they have not heard of it yet, though the mine has made some exceedingly rich shipments lately.

A report to Green-Meehan directors has just been received from Mr. C. A. O'Connell, manager, in which he gives the following figures: Number of days worked 53; average number of men employed, 35; number of tons of ore extracted, 47; actual cost of producing ore, $4,349.62; actual cost of production, per ton, $92.55; estimated value of ore shipped, $87,340.

Word has been received from Cobalt that an effort is being made to induce the settlers there to remove to Upper Cobalt, on Lake Temiscaming, a distance of about one and a half miles from the present site. The advantages of the new situation are that the site is much better, being on a gentle declivity, which slopes down to the lake. More sanitary conditions obtain, and good water can be secured. Upper Cobalt, it is also claimed, can be converted into a good summer resort.

Two shafts have been sunk on the eastern shore of Cobalt Lake by the Cobalt Lake Mining Company and calcite bloom has been discovered and some free silver obtained.

The draining of the lake will not be proceeded with for some time. The town of Cobalt, it is thought, might protest against the cutting off of the supply of water for fire protection purposes.

The proposition is to empty the lake by means of syphons and pumping plants.

At the second annual meeting of the Silver Leaf Mining Company, held January 30, in Toronto, the following were elected officers and directors for the ensuing year: President, Mr. A. G. Browning, North Bay; treasurer, Mr. A. E. Osler, Toronto; managing directors, Messrs F. B. Chapin and Frank Culver; directors, Messrs. S. C. Smoke, Toronto; Geo. L. Walker, Boston; John R. Stanton, New York; J. H. Rice, Houghton, Mich.; W. S. Pickett, Michigan, and Mr. Wm. D. Elwell, Boston.

Mr. E. T. Corkhill, provincial inspector of mines, Toronto, has returned to Toronto from the Gillies limit, where he has had charge of the operations of the government mining party.

He reports that work on the discovery reported some time ago is progressing steadily at the seventy-foot level, and that the ore body is showing up splendidly. In reply to a question as to whether they were shipping yet, he said that it had not been decided to do so yet, although they had lots of rich ore on the dump ready to do so. He states that all indications point to a great rush of prospectors into the Larder Lake district, when the spring opens.

A contract was signed recently between the financial agents of the Central Mines Company, Messrs. Thomas Nevins & Sons, and the Traylor Engineering Company, under which the latter is to supply the complete equipment for a 100-ton concentrator for the Cobalt-Central properties. This will be the first concentrator to be built in the Cobalt region. The crushers, rolls, rigs, concentrating tables, power house and elevators will be shipped as speedily as possible. The plant will enable the company to ship concentrates that will run high in silver. The company will also be able by this means to get full value for its shipments, as it will be able to carefully sample the same and know the average value before they are shipped, which is not possible to do on any shipments made from Cobalt as matters stand to-day.

R. Meeks, in The Engineer and Mining Journal, makes the following statements in a write-up of Cobalt:

It may be of interest to mention the final disposal of the ore from this district. While there are rumors of a smelter being built near the mines for the treatment of their ores, still, so far as can be ascertained, they are only rumors. Experiments are being conducted at Hamilton, Ont., which are said to be successful, and, moreover, it is claimed that mine-owners of Cobalt are financially interested in the venture. But at present all the ore is treated in three smelters, and must be hauled a long distance, and at considerable cost.

From the correspondence which I saw at Cobalt, the following smelter charges were derived: The American Smelting & Refining Company agrees to pay for 94 per cent. of the silver contents, and charges a flat rate of $10 per ton. The terms are cash immediately after the agreement of assays, and no payment is made for nickel, cobalt, or arsenic values. The matte containing the nickel and cobalt becomes the property of the smelters, and it is claimed that this is shipped to Saxony, Germany, for treatment. The shipper must also pay a sampling charge of from $5 to $6 per ton, and the freight charge, which amounts to $10.20 per ton. This charge is divided as follows: From Cobalt to North Bay, $3.20; from North Bay to New Jersey points, $7.

The Balbach Smelting & Refining Company of Newark, N.J., has a sliding scale, as follows:

Ore containing 400 oz. silver, $6; 400-500 oz., $5; 500-600 oz., $4; 600-700 oz., $3; 700-800 oz., $2; 800 oz., or more, no charge.

They agree to pay for 93 per cent. of the silver contents at New York market prices on the day of contract, settlement to be made 14 days after agreement of assays, or 1 per cent. less for cash. In this case, also, the shipper pays for sampling and freight charges as before.

Corroborated particulars relative to the charges made by the Canadian Copper Company, at Copper Cliff, were not available, but they are said to be as follows: The smelter makes no charge for smelting or sampling, and agrees to pay for 93 per cent. of the silver contents at market rates, and also agrees to pay for cobalt, providing it is in excess of 15 per cent., and that the nickel values are low. The freight charge to this smelter from Cobalt is $5.20, or practically one-half that charged to New Jersey. There is, besides, a direct saving of $5 to $6 for sampling, depending upon the value of the ore. In some districts a freight and treatment charge of possibly $25 per ton would be the determining factor between profit and loss.

BRITISH COLUMBIA.

The management of the Jumbo mine have decided to expend $75,000 in working this property, and the mine will be opened by a shaft of several hundred feet depth.

The total shipments of Rossland ore for 1906 were 277,361 tons, which is less than in 1905. The falling-off is due to a strike of the employees of the Crow's Nest Coal Company. At an estimated value of $12 a ton, the total output is worth $3,338,332. Since 1894 the total output has been 2,592,254 tons, valued at $36,728,480. The best shippers last year were the Le Roi and Centre Star which produced 126,396 and 114,500 tons of ore respectively.

On the White Bear mine drifting and diamond drilling has been done on the 800-foot level, and drifting and cross-cutting has been kept up on the 700-foot level. There has also been drifting on the 1,000-foot level. The most important find was made on the 700-foot level, when a shoot of ore 20 feet wide, and of good grade, was uncovered. About 1,350 tons of second-class ore has been run through, the plant producing 1,350 tons of concentrates. During the year 570 tons of raw ore were shipped.

The reports for the year show that the Central Star and its allied mines have much improved. The holdings of this company were increased by the purchase of the Idaho and the Iron Mask properties. The workings of the Iron Mask have been connected with those of the War Eagle and Centre Star by drifts and cross-cuts, which makes it possible to bring its ore out above its 450-foot level through the connections made between the 400-foot level of the War Eagle and the 350-foot level of th Centre Star. Considerable surface work has been done on the Centre Star, and its related properties and a large crusher having a capacity of 1,000 tons a day, and a 700-horse power motor have been installed. About 350 men are employed.

On the Le Roi mine is a staff of 325 men. A cross-cut has been driven through the dike, which runs across the western end of this mine, and ore bodies of good grade have been discovered on the west side of the dike. The western section has been opened on 800, 900 and 1,000 feet levels, and the workings have been extended 250 feet west of the dike. About half the tonnage which is now being shipped is from this portion of the mine. The explorations at the 1,200-foot level have resulted in the finding of a good shoot of ore, and by extending a winze from the 1,350-foot to 1,750-foot level, large ore bodies have been revealed. A contract has been let to sink the main shaft down below the 1,350-foot level.

The gross shipments of ore from the Le Roi-Tevo mine were 21,000 tons; of a gross value of $24 per ton, and the concentration milled 10,500 tons of second-class ore at a value of $3.50 per ton. The concentrates were worth from $25 to $30 per ton.

COAL NOTES.

The approximate output and shipments for the month of January of the Dominion Coal Company were as follows: Output, 252,108; shipments, 165,215.

One thousand union men went out on strike on February 4, at No. 3 colliery of the Nova Scotia Steel Company at Sydney Mines. The men refuse to work with non-union men, of whom there are about one hundred employed at the mines. The trouble, which has been brewing for some time, is purely between the men themselves, the company having absolutely nothing to do in the matter. For some time the union men have been trying to induce their non-union friends to join the association, but without success. At a meeting of the Pretoria Lodge, held on Saturday night, it was decided to quit work on February 4, in the event of their demands not being acceded to. All the prominent P.W.A. officials are now on the spot. The mine has been closed down.

General Manager Brown, in an interview stated that, for his own part, he did not think the company would interfere in the matter. The company cannot compel any man to join the union. They must treat all employees alike. On the other hand, the miners claim the company must discharge the non-union men or close down the mine.

The P.W.A. held a session of their lodge from 1.30 this afternoon until 10 o'clock to-night, when the entire situation was considered.

Nothing could be learned as to the conclusion reached, as it was decided not to divulge anything until to-morrow.

The Nova Scotia Steel Company has a large quantity of coal banked.

THE MINING AND INDUSTRIAL SHARE MARKET.

(Specially reported for the CANADIAN MINING REVIEW by ROBERT MEREDITH & Co., Mining Brokers, 57 St. François Xavier St., Montreal.)

Active interest in mining shares has not yet become evident, the market has been dull all the month for mines as well as other securities. The monetary situation and great congestion of general trade, is no doubt to a considerable extent responsible for the condition, but there is evidence that with the advent of spring active operations will be commenced in many camps, and it is probable that the production of precious metals this year will far exceed any previous one in the history of the Dominion.

In industrial shares the same condition prevails, and while most of the companies are showing good returns and doing a profitable business, the demand for the stocks is limited, and in consequence prices are irregular.

INDUSTRIAL NOTES.

Messrs. F. H. Hopkins & Co., are sending out a very artistic postcard, showing the 1907 model Ransome concrete mixer in operation.

The Gutta Percha and Rubber Manufacturing Company, of Toronto, Limited, state that their company is not in any way, shape or manner, a part of, or connected with any rubber merger or trust.

That more gold lies in the bosom of that far-north country than has ever been brought out of it is a fact which the public, in its usual carelessness, seems to have lost sight of completely. It seems to think because there's no more mad rush, there's no more gold.

But there are men here and there who are not content to let the precious metal stay up there any longer than they can help. One of the firms actively interested is The Yukon Consolidated Goldfields Company, Limited. Believing that the best aid they can have up there is electricity, they have purchased a large supply of apparatus from The Canadian Westinghouse Company. They will use this apparatus in dredging.

There is no doubt that electric power will be the most effective and least expensive in the end. And the operations of this company will be watched with interest.

The phenomenal growth of the use of concrete construction during the past two years has carried with it an equally augmented demand for finely crushed stone.

A few years ago the "screenings," a product of a stone crushing plant of a size of ¾ in. and less, was considered waste, while in a great many localities there is now the greatest demand for this size of product. Finely crushed stone is required for many purposes for which it was formerly considered unsuited.

In order to meet this new demand for finely crushed stone, the Allis-Chalmers Company, represented in Canada by the Allis-Chalmers-Bullock, of Montreal, has designed for the Gates Rock and Ore Breaker a short type of head and concaves, by the use of which the desired product may be obtained. An illustrated bulletin on this subject is now in preparation in which it is shown that the builders have not departed from the accepted standards of the Gates Breaker, the only changes being a simple substitution of the crushing parts. With the short head and concaves, the head is made shorter and of larger diameter than in the case of the standard length head.

This type of breaker has been used with excellent success when a fine product is desired from the machine, and when the stone fed into the breaker is of a comparatively small size.

It has also been used to equally good advantage as a rejection crusher when a fine product is desired and when the stone fed in is principally slabs and spalls from a larger machine which have been rejected by the screen.

The short head and concaves are fitted to either style D or style K Gates Breakers. The machine may be fitted with either the chilled iron head and chilled iron concaves, or manganese steel "gunlock" mantle and cast iron centre and manganese steel concaves.

A new double drum electrically driven hoisting engine built by the Lidgerwood Mfg. Company for the Inca Mining Company, which was shipped recently, will have to travel over an interesting and complicated route before it reaches its destination beyond the summit of the Andes in Peru and be set up for use.

The Santo Domingo Mines, for which the hoist is destined, lie in the old dominion of the Incas in Peru and behind the Lake Titacaca region where the Spanish conquerors found such stores of precious metals.

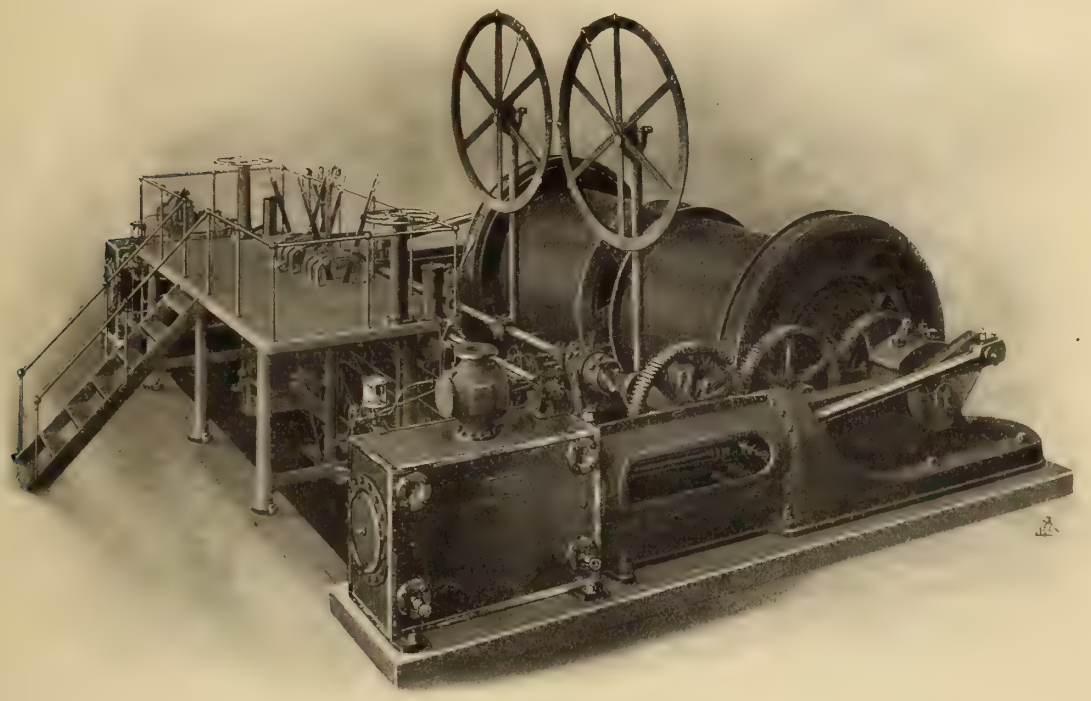
The Santo Domingo Mines were discovered about twelve years ago by a couple of Peruvians who had wandered across the summit from Arequipa in search of placer gold. Suddenly they discovered a vein of gold-bearing ore where a landslide had uncovered the native rock. A year later the property was acquired by a party of men of Bradford, Pa., and the Inca Mining Company and the Inca Rubber Company were formed. Besides the mining property the Bradford men have a concession of about one million acres of rubber producing lands which they are developing. Work on the mines was begun about eleven years ago, and more than two and a half million dollars worth of gold has been taken out up to this time. The company has about thirty miles of tunnels, shafts and drifts opened up.

The hoist which is now on its way is to be placed in a tunnel which has been run 1,700 feet into the mountain, cutting the vein 1,500 feet below the outcropping, at the top of the hill. A 500-foot-deep shaft has been sunk from the tunnel, and the new hoist is to bring the ore from the lower workings to the tunnel level. Accompanying the hoist are two 200 kilowatt General Electric generators. These will furnish current generated from a water power to operate the hoist, mill and other machinery of the mine. The mill contains 10 stamps, a concentrating and a cyaniding plant. The hoist will go by steamer to the port of Mollendo. From there a railroad will take it to Tirapata in the Lake Titicaca region. There the Inca Mining Company will receive it and carry it 150 miles over roads of its own building, to the mine. The first part of the way for 100 miles is over a waggon road. This reaches to the summit of the Andes at Lake Arracoma, 16,000 feet above the sea level. The next 50 miles is only a mule road. To make it possible to transport the big hoist over this part of the route it was built in sections, with no one piece weighing more than 300 pounds. The total weight of the hoist is 13,800 pounds. The drums are each 48 inches in diameter with 40 inch faces. The hoist is designed for a duty of 3,000 pounds, to be lifted at a rate of 400 feet per minute. It is driven by a 37 horse power induction motor of the General Electric Company's make, and operated by a 440 volt alternating current.

The power house is about a mile away from the mill. It is intended to develop about 250 horse power at first, and this can be doubled by adding another standpipe. The mine lies at an elevation of 5,000 feet above the sea. Beyond the mine the company has built a road about 75 miles long to the Tambopata river, where it is now putting together a little steel-hulled steam boat for navigating the Tambopata, Madre de Dias and Beni rivers. At the crossing of the Irambari river the road is carried by a wire rope suspension bridge, 320 feet long. Telephone lines 250 miles long, belonging to the company, connect the mines with the railroad and points where work is being prosecuted.

Safety Blasting Fuse was invented in 1836 by the late Wm. Bickford, of Cornwall, England, and the firm of Bickford, Smith & Co., Ltd., are his successors. White Jacket Fuse is their latest production, and takes the place of Blue Jacket Fuse, which was introduced into South Africa and Australia four years ago, and into Canada quite recently by Mussens Limited. The blasting fuse, which is ordinarily used all through the Dominion of Canada at the present time, is white countered gutta percha. One of the properties of gutta percha is that, on keeping for several months, it perishes, and owing to this property, it has always been necessary to be sure that gutta percha fuse was fresh from the factory, or at any rate not more than six months old, in order that it might be perfectly safe in wet ground. If the gutta percha has perished in any way, the fuse is very likely to crack and let damp into the powder, which would prevent the fuse burning through to the end, which would cause one of those misfires, which frequently lead to serious loss of life. In the White Jacket Fuse the water-proofing is put on twice with a special black varnish, the composition of which is the property of Bickford, Smith & Co., and which no one else has yet been able to successfully copy.

White Jacket Fuse will stand twenty-four hours immersion in water, and this is far more than is ever required in practice. Instead of having to be used as soon as possible after leaving the factory, it can be kept for one or two years without in any way deteriorating, and is of great importance in the case of a commodity like fuse, which is held in stock by dealers in different parts of the country, making it almost impossible for the customer to tell how long the stock has been held. Besides these special qualities, the burning speed of the fuse is every regular, and is guaranteed to vary less than ten per cent. on either side of the standard. It also stands rough handling and rapid changes of climate and temperature better than any fuse which has ever been on the market in Canada before.



The Hancock Cons. Copper Co., Mr. John L. Harris, Supt., whose mines are located at Hancock, Mich., has recently ordered from the Sullivan Machinery Co., of Chicago, a hoisting engine to be used for sinking the principal shaft and for permanent service, after the shaft is completed to its final depth of 4,000 feet.

This hoist will be of the first motion, heavy duty, Corliss type, with engines 24 in. diameter by 48 in. stroke, and two loose drums, 8 feet in diameter by 9 feet long, driven by band friction clutches, and designed for hoisting in balance. The drums will be grooved for 1 1-4 in. steel rope, and the maximum hoisting speed under full load will

be 3,500 feet per minute. The clutches and band brakes will be steam operated, with automatic compressed air substitution, in case the steam pressure falls below a given point, owing to accident or for other reasons.

This hoist will be furnished with the Sullivan patented automatic throttle closing device and interlocking automatic stop. By these contrivances, the steam will be automatically shut off at a fixed distance from the top of the shaft, allowing the engineer to bring the cage to a stop at the desired point, by use of the brake. In case the engineer, for any reason, fails to set the brakes, they will be set automatically at the proper point, to prevent an overwind.

Hoists of this same design have recently been furnished to the Republic Iron & Steel Co., Republic, Mich., the Ironton and Colby Mines, Bessemer, and the Dunn Mine, Crystal Falls, Mich.

Sullivan Hoisting Engine, Ironton Mine.

MINING INCORPORATIONS.

ONTARIO.

Mines, Limited. Capital, $40,000, divided into four hundred shares of one hundred dollars each. Head office, Toronto, Ont. Provisional directors: W. H. Moore, Gerard Ruel and Geo. F. MacDonnell, all of Toronto, Ont.

Cobalt Gem Mining Company, Limited. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: J. E. Day, J. M. Ferguson, E. V. O'Sullivan and Mary Donevan, all of Toronto.

Silver Horse Shoe Cobalt Mining Company, Limited. Capital, $40,000, divided into forty thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: Jos. Brown, Neil Sinclair and A. M. Harley, all of Toronto, Ont.

Kennedy Cobalt, Limited. Capital, $1,000,000, divided into one million shares of one dollar each. Head office: Toronto, Ont. Provisional directors: W. H. Jackson and J. A. Morden, of Toronto, Ont., and David Kennedy, of Toronto Junction, Ont.

The Silverford Cobalt Mining Company, Limited. Capital, $200,000, divided into two hundred thousand shares of one dollar each. Head office: Toronto, Ont. Provisional directors: T. H. Barton, F. D. Byers, and O. F. Taylor, all of Toronto, Ont.

The Jack Pot Cobalt Silver Mining Company, Limited. Capital, $750,000, divided into seven hundred and fifty thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors: R. S. Gilpin, D. A. Rose and F. T. Whittemore, all of Toronto.

Quebec Cobalt Mining Company, Limited. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: J. E. Day, J. M. Ferguson, E. V. O'Sullivan, J. H. Hallett and Mary Donevan, all of Toronto.

Duluth Cobalt Mining Company, Limited. Head office: Haileybury, Ont. Capital, $500,000, divided into five hundred thousand shares of one dollar each. Provisional directors: J. F. Gillies and J. F. Hope, of Toronto, and John Mackay, of Sault Ste. Marie, Ont.

The Cobalt Mutual Mines Company, Limited. Capital, $100,000, divided into one hundred thousand shares of one dollar each. Head office, Haileybury, Ont. Provisional directors: Arthur G. Slaght, Hugh LeRoy Slaght and Wm. Henry Phelan, all of Haileybury, Ont.

Montreal Cobalt Power Company, Limited. Capital, $1,000,000, divided into ten thousand shares of one hundred dollars each. Head office: Toronto, Ont. Provisional directors: J. W. Bain, G. B. Strathy, R. R. Perry, L. C. Todd, and J. E. Riley, all of Toronto, Ont.

Cobalt Mines Syndicate, Limited. Capital, $100,000, divided into one hundred thousand shares of one dollar each. Head office, Toronto, Ont. Provisional directors, J. E. Day, John M. Ferguson, E. V. O'Sullivan, James H. Hallett and Mary Donevan, all of Toronto.

London-Cobalt Mining Corporation, Limited. Capital, $2,000,000, divided into two million shares of one dollar each. Head office: Toronto, Ont. Provisional directors: Geo. Stevenson, F. H. Potts, J. W. McDonald, E. Gillis, and Eva Lena Bradley, all of Toronto.

The Cobalt Ore Sampling Company, Limited. Head office: Cobalt, Ont. Capital, $100,000, divided into one hundred thousand shares of one dollar each. Provisional directors: W. H. Fletcher, G. W. Parker, C. H. Moore, G. A. Woodward and George Ross, all of Cobalt, Ont.

Independence Cobalt Silver Mines Company, Limited. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Toronto, Ont. Provisional directors: W. M. Williams, Joplin, Missouri; C. E. Mabon, of Lewiston, New York, and C. E. Loomis, of Attica, N.Y.

The Sharpe Lake Cobalt Silver Mining Company, Limited. Capital, $1,000,000, divided into one million shares of one dollar each. Head office, Ottawa, Ont. Provisional directors: J. E. Murphy, W. Abbott, of Cobalt, Ont., and W. R. Bradbury, W. E. Matthews and R. G. Code, of Ottawa, Ont.

The Bucke Silver and Cobalt Mining Company, Limited. Capital, $300,000, divided into three hundred thousand shares of one dollar each. Head office: Ottawa, Ont. Provisional directors: F. A. Heney, Nepean, Ont.; H. Hopp, E. L. Horwood, T. A. Beament and John L. MacLaren, all of Ottawa, Canada.

The Cobalt and Larder Lake Gold Mining Company, Limited. Capital, $300,000, divided into three hundred thousand shares of one dollar each. Head office: New Liskeard, Ont. Provisional directors: Geo. C. Legge, Norman Bingham Strong, W. J. Egan, J. J. Kelly, and H. D. Graham, all of Haileybury, Ont.

The Youngstown-Cobalt Silver Mining Company, Limited. Capital $1,000,000, divided into one million shares of one dollar each. Head office: Cobalt, Ont. Provisional directors: Geo. Albert Baker, Youngstown, Ohio; Walter A. Sadler, and D. H. Granville, of Cobalt, Ont., and G. W. P. Hood, of Toronto Junction, Ont.

The Casey Mountain Cobalt Mining and Development Company, Limited. Capital, $250,000, divided into two hundred and fifty thousand shares of one dollar each. Head office, Haileybury, Ont. Provisional directors: R. B. Fergusson, R. G. Williamson, Geo. A. Pollard, David A. Reid, all of Regina, Saskatchewan, and David Williamson, of Haileybury, Ont.

BRITISH COLUMBIA.

The Bay Gold Mining Company, Limited. Capital, $200,000, divided into two hundred thousand shares of one dollar each. Office in Yale District, B.C.

The Old Dominion Copper Development Syndicate, Limited. Capital, $35,000, divided into thirty-five thousand shares of one dollar each. Office, Kamloops, Yale District, B.C.

CATALOGUES.

The Atlas Engine Works, of Indianapolis, have issued Bulletin No. 134, showing the various engines and boilers manufactured by the Atlas Engine Works. The headquarters of the company are at Indianapolis.

Catalogue A describes the Butters Patent Filter. This will thoroughly filter and wash slime at a minimum cost, and will handle slimes that cannot be treated by any other method. The sales agents are The Blaisdell Company of Los Angeles, Cal.

"Everlasting," is the title of Catalogue No. 16, issued by Wendell & MacDuffie, 26 Cortlandt street, New York. This firm makes asbestos shingles, slates and sheathing, made wholly of mineral fibre, asbestos, and the best Portland cement obtainable.

The Report of the Board of Trustees and of the State Mineralogist, California State Mining Bureau, have been issued to cover the fiscal year ending January 30th, 1906. The total value of the mineral production of California during that period was $43,069,227.

A useful article in a prospecting outfit is a No. 10 forge; height 31 inches, width, 18 x 18 inches, weight, 125 lbs. They claim that if one of these forges should fall 20 feet its appearance might be spoiled, but it would be ready for business. Mussens Limited keep them in stock.

Mussens Limited send us a pamphlet descriptive of the Reading Multiple Gear Chain Hoist, capable of handling weights of from 1,000 to 40,000 lbs. Also some descriptions of hoisting machines manufactured by Marsh & Henthorn, of Belleveille, Ont., for which Mussens Limited are the agents.

The Sullivan Diamond Core Drills are known the world over, though some interesting details may be gained, even by experienced men, from Catalogue No. 5, issued by the Sullivan Machinery Company, Railway Exchange Bldg., Chicago. It leaves very little to be said about the Sullivan Diamond Drill.

The Hathorn Works of the Western Electric Company are adequately described in a well illustrated pamphlet issued by that company. A map showing the positions of the different branches of the Western Electric Company, may be found useful by those wishing to procure electrical apparatus and supplies.

Catalogue No. 1, issued by the C. L. Hathaway Rock Crusher Company, Denver, Col., is descriptive of the Gyratory Rock and Ore Crusher manufactured by that firm. Every part of the crusher is shown, and a very full description of its mechanism, and the mechanical principles involved is included.

"The Diamond Drill and its Work" is the title of Catalogue No. 26, issued by the American Diamond Rock Drill Company, 95 Liberty street, New York City. Anyone having drilling to do would do well to procure a copy of this pamphlet before deciding where to order. Several of these drills are in use in the regions about Cobalt and Sudbury.

"Westinghouse Motor Applications" this month treats of A.B.C. Disk Fans. The introduction to this pamphlet states that ventilation is a subject that can never receive too careful consideration—a statement with which our readers well agree most thoroughly. Westinghouse motors from .25 to 2.85 h.p. are suitable for driving fans 18 inches to 60 inches in diameter. The Canadian Westinghouse Company will be pleased to send this pamphlet to all enenquirers.

Westinghouse Motor Applications, is the name of a little booklet issued by the Westinghouse Electric Manufacturing Company of Chicago, represented in Canada by the Canadian Westinghouse Company, Limited, whose general offices and works are at Hamilton, Ont., with branches in Toronto, Vancouver, Winnipeg, Montreal and Halifax. This publication deals with the use of the small power motor for blacksmiths and blowers. Small motor powers are to-day replacing hand drive with even greater success than has been attendant upon the replacement of other forms of power drive by the larger types of motors.

CONFEDERATION LIFE BLDG.

TORONTO, ... 190

Dear Sir:-

This letter accompanies the first number of a new fortnightly journal devoted to Canadian Mining, Metallurgy and kindred subjects. With the new publication is incorporated the "Canadian Mining Review," a monthly which has been for twenty-three years the leading mining journal of the Dominion.

The AIM of the publishers is to provide a paper that will effectively cover the entire field of mining in the Dominion, and special effort will be made to publish reliable information at first hand. To that end a staff of responsible and properly qualified correspondents has been engaged in the respective mining provinces and districts. In addition many of the most eminent engineers, metallurgists and geologists have consented to act as special contributors.

The POLICY to be adopted in the editorial conduct of the new paper will be such as to ensure the respect and approval of all those engaged or interested in the promotion of legitimate mining in this country. Neither fear nor favor will influence the tone of the editorial comment on men and affairs, and an honest endeavor will be made to protect the public against company frauds and misrepresentations. At the same time it is hoped to maintain that happy mean, where fact will be presented without the tinge of either undue optimism or unnecessary pessimism.

Each issue of the Journal will be well illustrated, and, with a view to advertising the mineral resources of Canada, representative minerals, reproduced by the three-color process, will appear on the front cover from issue to issue.

In short, it is proposed to publish a well-printed, well-edited and well-informed fortnightly Mining and Metallurgy paper, and to establish thereafter a reputation for intelligence and honesty of purpose.

With this brief explanation the publishers solicit your support and co-operation, and would request in particular that you sign and return the attached subscription blank. Should you already be a subscriber, however, they would ask you to be good enough to hand this letter with your recommendation to a friend or colleague interested in Canadian mining, or to whom a publication of the character now contemplated would be likely to appeal. It is also desired to place the Journal in all Libraries and Reading Rooms in the Dominion, and anything you can do in promoting this purpose in your own locality will be very highly appreciated.

Yours very truly,

J. J. Harpell

Business Manager

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

A person 18 years of age or over having discovered mineral in place, may locate a claim 1,500 feet x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

A free miner may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each miles of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The Attention of Miners and Capitalists in the United States and in Europe is invited to the

Great Mineral Territory

Open for Investment in the Province of Quebec.

GOLD, SILVER, COPPER, IRON, ASBESTOS, MICA, PLUMBAGO, PHOSPHATE, CHROMIC IRON, GALENA, Etc.

ORNAMENTAL AND STRUCTURAL MATERIALS IN ABUNDANT VARIETY

The Mining Law gives absolute security to Title, and has been specially framed for the encouragement of Mining.

All mines belong to the government of the Province on all unsold lands and on all those sold since the 24th of July, 1880, but gold and silver are always reserved, whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such licenses the first right to purchase the mines. In the case of lands where the surface alone is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is $5.00 per 100 acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the government. The purchase price is as follows :

Mining for superior metals on lands situate more than 12 miles from a railway in operation, $5.00 per acre, and on lands situate less than 12 miles from such a railway, $10.00 per acre ;

Mining for inferior metals—the price and the area of the concessions are fixed by the Lieutenant-Governor in council.

The words "superior metals" include the ores of gold, silver, lead, copper, nickel, and also graphite, asbestos and phosphate of lime ; and the words "inferior metals" mean and include all the minerals and ores not included in the foregoing definition and which are of appreciable value.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions : The full price must be paid in cash ; specimens must be produced and accompanied by an affidavit ; a survey at the cost of the applicant must be made on unsurveyed lands ; work must be bona fide begun within the two years.

Mining licenses giving the right to work the mine and dispose of its products, are granted on payment of a fee of $5.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts. The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the New Grand Trunk Pacific Railway will run.

The government has made special arrangements with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines at Quebec, under the direction of the Superintendent of Mines, will give all the information asked for in connection with the mines of the Province of Quebec, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to :

Publisher's Announcement

THE delays and vicissitudes incidental to the inception of any new publication have temporarily modified the "Journal's" editorial and business plans.

It is, however, a part of our design to establish a page devoted to answering the enquiries of correspondents. We shall, moreover, be glad to identify minerals, to give information regarding mining matters, and to generally satisfy all pertinent enquirers.

We hope also to be able to announce, from time to time, the publication of articles of immediate technical value.

The "Journal," with its large and admirably placed circulation, is well adapted to serve the needs of those who are looking for help or employment. For these columns we shall make special rates.

We shall welcome suggestions and criticisms at all times.

No section of Canada in which mining is carried on will be overlooked in our effort to deal fully with our field.

The Business Manager intends to put an index to advertisements in a prominent place in ensuing issues.

A certain amount of space will be used in every number for the purpose of attracting attention to specific features of our advertising columns, and any change in our policy will be announced in this space.

SCHOOL OF MINING

A COLLEGE OF APPLIED SCIENCE

(AFFILIATED TO QUEEN'S UNIVERSITY)

KINGSTON, ONTARIO

1. Four Years Course for a Degree (B.Sc.)
2. Three Years Course for a Diploma in

(a) Mining Engineering.
(b) Chemistry and Mineralogy.

(d) Chemical Engineering.
(e) Civil Engineering.
(f) Mechanical Engineering.
(g) Electrical Engineering.
(h) Biology and Public Health.

For Calendar of the School and further information apply to the Secretary, School of Mining, Kingston, Ontario.

McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science, and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

ANNOUNCEMENT

The publishers beg to announce that *"The Canadian Mining Review,"* which has so long and so honorably identified itself with mining affairs in Canada, has been incorporated with *"Canadian Mining Journal."*

In taking this step the publishers were actuated by the conviction that it would be decidedly better for the whole mining fraternity to have one responsible national periodical.

The *"Review"* has in its lifetime done excellent work. It has helped to make history.

The *"Journal,"* it is hoped, will, with ampler opportunities, carry on the work in a larger field.

THE CANADIAN MINING JOURNAL

Its Opportunity, Aim and Purpose

At no time in the history of industrial development in Canada has the outlook appeared more favorable than at present. The country is enjoying in full measure a wave of prosperity, the effect of which is manifest in the phenomenal increase in trade activities, the extension of markets, the expansion of manufacturing interests, and the ready disposition of outside capital to seek investment in Canadian undertakings. This prosperity is general and widespread. It accurately describes conditions from seaboard to seaboard and is applicable with equal truth to all Canadian industries. In mining, however, in whose welfare we are concerned in particular, the recent advances and improvements have been gratifying to a degree, and all indications now promise an extraordinary revival of interest. In this belief the publishers have considered the occasion opportune to introduce to the public a new mining journal, national in range, of which the present is the first issue. It is thought that there is opportunity and wide scope for a periodical such as it is proposed *The Canadian Mining Journal* shall be, and the many expressions of encouragement and approval already received from men of eminence and position in the engineering and metallurgical professions, mine managers and others, have confirmed this view.

It is customary with the first appearance of a periodical for the publisher to make some pronouncement of aim and purpose. We conform to this convention: but we trust ere long to substitute achievement for promise. The aim, then, of this Journal is to supply a recognized demand. Without intending disrespect to our contemporaries, all excellent in their way, there does not exist at the present time a periodical ostensibly devoted to our mining and metallurgical industries which can lay true

claim to be really representative of those interests, or to comprehensively cover the wide field of Canadian endeavour in these directions. *The Canadian Mining Journal* starts its career under favorable auspices. It has no special interests to serve, no prejudices to obstruct its usefulness, and it is untrammeled by considerations of financial disability in providing the necessary machinery by which to accomplish its purpose. Hence, in the understanding that the first function of a newspaper is to publish news, arrangements have been completed to secure reliable information at first-hand by the engagement of a staff of resident and travelling correspondents, the majority of whom are technically trained men, in whose independence of view and general trustworthiness we have every confidence. A number of the most eminent specialists in Canada have also generously consented to lend their services in advisory capacities and will, moreover, act as special contributors to these pages. In this connection, it may be mentioned in passing, that *The Canadian Mining Journal* hopes to create a new departure in Canadian technical journalism in respect to the remuneration offered contributors to its columns. Heretofore too much advantage has been taken of the good nature of our leading scientists, who have been asked to write for Canadian papers on the ground that they would thus display a meritorious public spirit. But modern conditions of struggle and competition, "something for nothing," is anomalous. It is neither fair to ask nor just to expect such concessions; and *The Mining Journal* hopes to substan tiate its conviction that journalism in Canada can thrive without dependence on charity.

We have alluded to the recent revival of mining in Canada; but while this implies material progress of industry, the discovery of new and rich mineral territory and the extension of the productive area, we do not lose sight of the fact that this very improvement is resposible for "boom" conditions, which, as they are likely to react to the detriment of legitimate undertaking, are to be deplored. This exuberant state of affairs, however, is natural and inevitable; but it remains for the press—and in this respect *The Canadian Mining Journal* sees its duty very clearly—to unhesitatingly assume the task of safeguarding the public interests by fearlessly setting its face against "wild-catting," and the machinations and misrepresentations of the fraudulent company promoter. British Columbia in general, and Rossland in particular, have scarcely yet recovered from the ill-effects of the bursting of the "boom" bubble of eight years or so ago. The Cobalt "boom" promises to assume still greater dimensions. Althought the undoubted richness of the area warrants enthusiasm, it is safe to assume that a considerable proportion of the properties in which the public are being invited to invest—some of them in fact, described as Cobalt mines, are not even situated within the boundaries of the district, cannot pay to work, and their promoters have no false ideas on that score. This, and the speculative inflation of values, are clouds on the horizon; and it rests largely with the technical and financial press to avert the threatening storm.

In making itself an organic part of Canada's industrial life, *The Journal* will strive to follow intimately the rising generation of technical men. There are few who realize the valuable work which our technical colleges are doing, in supplying year after year highly-trained engineers, chemists and metallurgists. There are fewer who appreciate the tremendous importance of keeping these young men within our own borders, of training them to meet our own industrial problems. Thus and only thus may Canada fulfil her destiny.

With this brief introduction we bespeak for *The Canadian Mining Journal* favor and support. We shall hope to establish between our readers and ourselves sentiments of common regard.

If by our efforts and their co-operation we are able to assist in the upbuilding of a great Canadian industry, that, we feel, will be a privilege indeed, an incentive to work and effort in the widest sense and a high goal at which to aim.

EDITORIAL NOTES

An important change in the tariff, announced on the 11st inst., provides for a 99 per cent. drawback on bituminous coal, when imported by proprietors of smelting works and converted at the works into coke for the smelting of metals from ores. An ancient proverb tells us what the good dame remarked when she contributed her mite to the industrial resources of Scotland.

The necessarily superficial character of much of the geological and prospecting work done in Canada is now and then accentuated by the discovery of rich deposits in districts which have been explored and settled for many years.

The recently announced discovery of cassiterite in Lunenburg county, Nova Scotia, emphasizes the need and utility of constant and intelligent search for mineral deposits.

The field geologist is too hard-worked to indulge in detailed prospecting. But what he can do is to delimit the field for the prospector. Apparently this discovery of the valuable mineral cassiterite is due largely to the intelligent work of Mr. Faribault.

The demand for tin is constantly increasing. The supply is, on the other hand, practically stationary, and, as the reserves are diminishing, the metal is gradually rising in price.

In nearly all the tin-producing regions of the world cassiterite or tinstone, as it is commonly called, is the chief tin-bearing mineral.

Cassiterite is a black, brown or colorless mineral. In most instances the color is black or brownish. When black it shows a metallic lustre, when brown its lustre is resinous. Its streak, when rubbed on a rough unglazed porcelain surface, is never black, but varies from white to chocolate brown. It is hard, though very brittle and friable. Its brittleness easily gives a mistaken idea of

its hardness. It is heavy, and, therefore, easily separated by panning from most of the minerals usually associated with it.. In situations it occurs in sizes ranging from a graia up to individual pieces weighing one or two pounds.

Almost invariably cassiterite is found in veins cutting granitic rocks. Usually these veins are of quartz. The minerals topaz, fluorite, tourmaline, wolframite and arsenical pyrites (mispickel), are generally associated with the cassiterite. In these cases the cassiterite is of secondary origin.

But instances are known in New South Wales and the Dakota Black Hills where tinstone has been found in pegmatite as an original constituent of the rock. Presumably, the recently discovered tinstine in Nova Scotia falls under the latter category.

In a recent issue of *The Monetary Times,* some caustic remarks are made regarding certain alluring mining advertisements, which are to be seen in the daily press.

General and vague condemnation is, no doubt, valuable; but it fails of its purpose. A sure, though perhaps Utopian remedy, would consist in the concerted movement of the press against advertising any but *bona fide* mining companies.

It may devolve upon *The Canadian Mining Journal* to take specific action in the not remote future. Distasteful as this duty is, it must occasionally be done, if the best interests of the mining industry are to be conserved.

Meanwhile *The Journal* strongly recommends the excision of a few of the most efflorescent advertisements from the pages of otherwise responsible newspapers.

Knight-errant of a century that knows no romance, the prospector hits the lone trail for the tall uncut. Razorless, he perforce must grow a beard. Persecuted by the ubiquitous mosquito, suffering all the ills of exposure and privation, he eats his dough boys, smokes his twist and is content. Impelled by an urgent faith, he perseveres and fails and is forgotten, or, he finds and is famous.

Unsuccessful, he is spurned and flouted. Successful, he is fawned upon, flattered and not infrequently spoiled.

A badly regulated thirst is a not unusual concomitant of the first flush of achievement. For this the one specific is a return to the bush.

But, levity apart, his country owes to the fearless, tireless prospector a surprising debt of gratitude. Were it not for his perfervid enthusiasm, Canada would not now be reaping the rich harvest of Cobalt, not would she be taking her place among the great mineral producers of the world.

Laws are made with an eye single to the glory of greedy corporations; lobbies are vocal with the clamorings of special interests. The broker, the banker, the miner and the operator howl to the legislative moon when all things do not fit their fancies.

But the prospector, unprotected, uncaring mayhap, is silent. He cannot organize, he does not strike. He dies strange deaths in lone lands. Hymned by no bard, unsung of poets, the prospector is girding up his loins against another season of peril and flapjacks. We wish him God-speed! Prosperity be with him! Prosit!

The present agitation over the Ontario Government's proposed taxation of mines will supply much polemical pabalum to the press. From a controversial standpoint, the question is a somewhat torrid one.

The Journal wishes to encourage not controversy, but (so far as may be) dispassionate constructive criticism.

The conditions under which Ontario mining legislation has been framed must be kept in mind. No body of laws can be final. They must be a growth. Additions and amendments should be made only after mature consideration. A regulation which appears innocuous and even beneficial now, may develop a surprising sting in course of time. We have a body of mining men organized under the name of the "Canadian Mining Institute." These men are responsible citizens. Why should not the "Institute" be consulted in matters so vitally important to its members' welfare? We can think of no more capable, no more representative organization. It includes men who are versed in every phase of mining activity, and it embraces a wide diversity of interests.

We do not for a moment impugn the motive which inspire Ontario's legislators. It is probable that the objectionable features of the proposed bill have not been promptly enough nor strongly enough represented to the Government.

But even the eleventh hour is not too late. Let the Government step warily. It is making or marring for all time.

From the nature of his work the practical foundryman meets with difficulties which are surmountable only by the expenditure of much time and energy. One by one, he must encounter obstacles which to him are new, but which have, in modified forms, been met by many before him.

The key to some of these difficulties is held by the chemist, the solution of others is the property of foundrymen of riper experience.

Although there is a tendency to-day to call upon the chemist for incidental help, in relatively few cases is the function of applied chemistry recognized.

And, on the other hand, the experienced foundryman is apt to look upon his knowledge, knowledge gained in the rough school of xeperience, as his own peculiar property.

There are, in Canada, several active foundrymen's associations. These do much good. But, we believe, that an association organized upon a national scale, with active local sections, would inevitably improve the character of foundry practice.

Few establishments are large enough to justify the maintenance of a laboratory for their own work. But it is entirely practicable for a group of foundry owners to support an efficient chemist.

And the chemist in no sense supercedes the practical man. He merely provides a ready remedy for difficulties; he offers a short cut to efficiency.

Further, nothing can take the place of constant interchange of opinions and advice. The progressive man must be alive to this. A progressive industry must establish a community of interests among its workers.

A bill, entitled "An Act to Supplement the Revenues of the Crown," was given its first reading before the Ontario Legislature on February 13.

In the preamble it states that large sums of money have been and are being expended by the Province in administering mining affairs, encouraging mineral industries and opening up railways and other facilities to mining regions, therefore it is expedient to increase the revenues of the Province.

The bill accordingly provides that every mine in the Province, the annual profits of which exceed a certain

sum, shall be liable for an annual scaled tax, adjusted in proportion to such excess annual profits.

It further provides for the imposition of an acreage tax on all mineral locations and mining claims in any unorganized territory of the Province.

Clause 23 of the bill provides that in case any doubt arises as to the liability of any person to pay a tax under this Act, the Minister of Mines may compromise the matter by acceptance of such amount as he may deem proper.

Taken in its entirety, the bill is cumbersome. It is, moreover, inopportune. Undoubtedly it has been inspired by an honest and not unnatural desire to secure for the Province a larger share of Cobalt's riches. In attaining this end the framers of the bill have overlooked the inevitable effect that such an enactment would have upon mining interests generally.

That it would tend to divert foreign and domestic capital to other fields is undeniable. But its most immediate effect would be to depreciate the holdings of small investors.

In operation it would be singularly complicated.

Clause 23, referred to above, clothes the Minister with discretionary powers so absolute as to give him entire liberty to free any person or persons from payment of the tax. This is not only unsound, but unsafe.

Part II. of the bill deals with natural gas. It imposes a tax (amount yet unspecified) on every thousand feet flowing, drawn or pumped or produced by a well.

"A meter," it continues, "shall be affixed . . . to every pipe or duct at or near the mouth of every well," for the purpose of measuring and recording the total gross quantity of gas produced by the well.

It will be noticed that a distinction is made here. The tax on gas is on the gross quantity produced and not upon profits.

Incidentally it may be remarked that the affixing of meters to all pipes or ducts is either a physical impossibility or a matter implying a largely disproportionate expense.

It is, perhaps, pertinent to observe that in drafting legislation of this kind competent specialists should be consulted.

Could local interests and all questions of expediency be relegated to oblivion, we are confident that but few thinking men would dispute the necessity and adequacy of a properly adjusted acreage tax. The subject is a large and complicated one. Expediency must in most human affairs play a large part. But we are approaching a parting of the ways, when principles must be considered. Therefore it behooves us as citizens of a great country to squarely and fairly meet the questions of to-day and to settle them to the permanent good of that country and not to the temporary gain of party or persons.

The method, at present in vogue in Canada, of stimulating industry by subsidizing production is open to attack on sound economic grounds. We believe that the whole principle of the Government bonus on output is fundamentally unsound. In the case of the Canadian mineral oil industry we have, for example, an illustration of the inadequacy and disadvantages of the bounty as compared with the more straightforward and economically sounder protection duty.

Formerly Canadian oil was protected by a duty of $1.75 per barrel. At the solicitation of the American Trust, the Standard Oil Company, this duty was removed. In support of this step it was argued that Canadian production was not equal to the domestic demand. And the presumption was that the Canadian consumer would benefit by the free admittance of oil from the United States. Meanwhile, to compensate the operators of oil wells in Canada, the Government agreed to pay a bounty of fifty-two and a half cents per barrel on production.

As a consequence of all this the Canadian consumer pays exactly the same price for his oil as he did before.

The Canadian producer is getting $1.14 per barrel at the well in the Tillbury field, instead of $2.12, the average price per barrel in 1904, the year before the duty was removed. The American trust pockets the difference. Moreover, we are now supplied with American oil to the detriment of the new Canadian oil fields; which, together with the older sources, are quite capable of fully supplying the home market.

From other points of view the bounty system is open to objection.

One strong count against it is that it discourages the investment of capital in industries which, from the fact that they are subsidized by Government, are looked upon as unstable.

The very name "bounty" is unfortunate. Our mining industries require not the fortuitous and inadequate help of a bonus; but assistance of a very different nature.

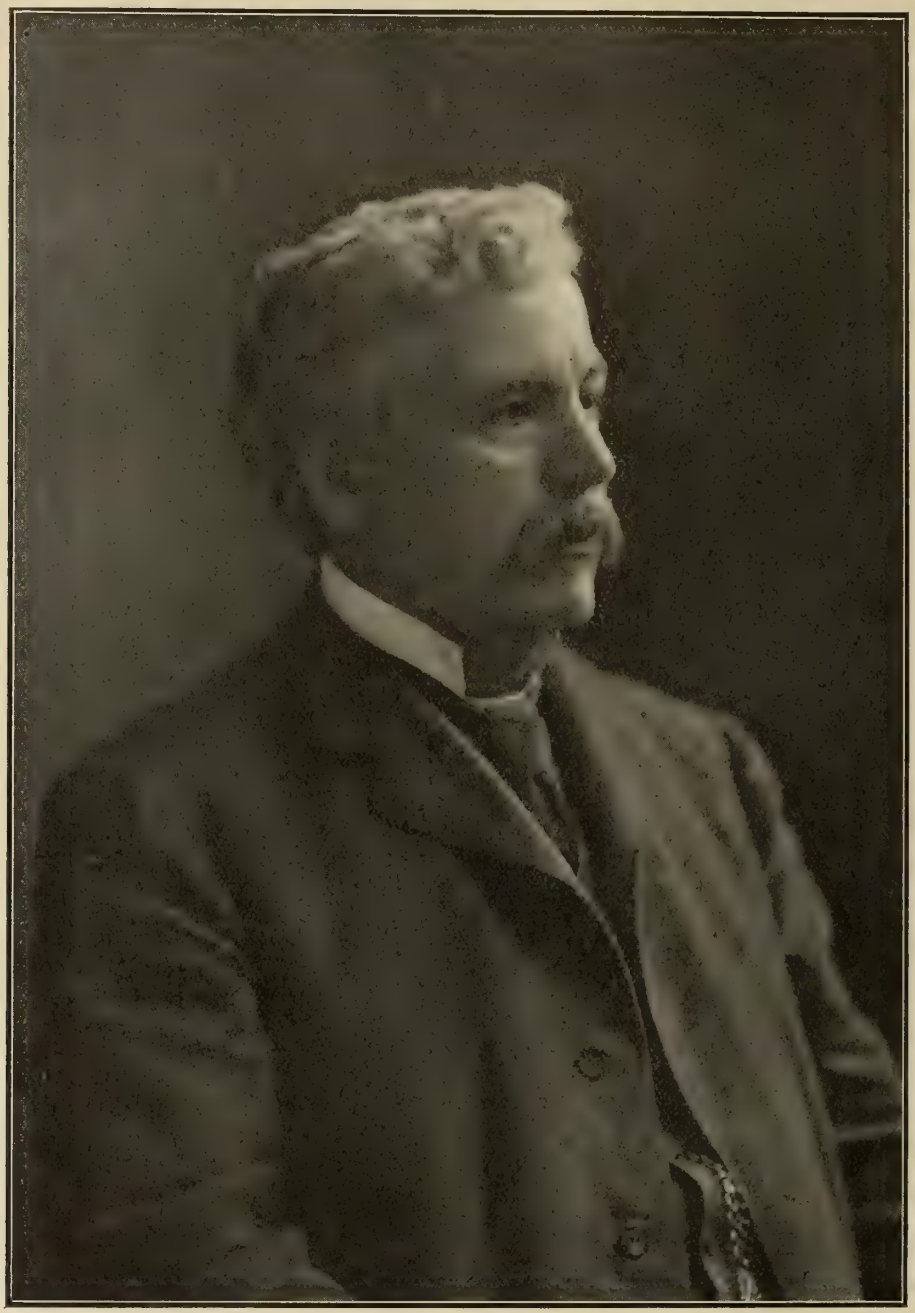
A complete and well rounded system of education provides for the development of *all* the possibilities and powers which may be latent in us. It is incomplete and one-sided if it neglects or overlooks any of them. Judged from this standpoint, our educational facilities in Canada are far from complete. General education is fairly well provided for in our common schools, high schools and universities, but we have hardly done more than make a fair beginning in that kind which bears directly upon industries, viz., technical education. Now that we have entered upon a period of rapid growth, we should study carefully all the measures which may be taken to insure this growth shall be healthy, steady and permanent. We must work at our own problems in our own way. We may get good ideas by studying what has been done in other countries farther advanced in manufactures and other productive industries, but it would not be wise to transplant their systems to our soil. It is better to begin with existing institutions and develop them. We have here and there agricultural colleges, mining schools, dairy schools, and schools of engineering, but we have no technical schools devoted to textile, ceramic, metal-working, chemical, and other great industries. Technical education, pure and simple, is the function of such schools. In the modern world they are just as necessary to the effective development of the nation as are the common schools, the high schools, and the universities. All are necessary. We cannot afford to neglect or ignore any means of promoting clear thinking, keen research, and skilful production. We are becoming alive to this fact, and some of our societies, including the Canadian Manufacturers' Association, the Canadian Mining Institute, and the Society of Chemical Industry, have taken steps to bring the subject before the public and before the Legislatures. This is the right direction. We cannot afford to wait for the chance beneficence of individuals. There is one good idea we can import from Germany. There,

where universities, high schools and trade schools work together in their influence upon industries, they are sustained by the central Government, by the kingdoms, grand-duchies, etc., and by the municipalities. While the Act of Confederation leaves educational matters to the Canadian Provinces, there is nothing in it to prevent the Dominion Government from granting subsidies to provinces and municipalities for technical education. Such assistance will be necessary, as the revenues of the provinces are very limited, while that of the Dominion grows rapidly with the expansion of the country. Agriculture, mining, transportation and manufactures are national. This is recognized in the constitution of the Dominion Departments and their branches. Here is a chance for some of the Ministers to do a piece of work which will keep their memories as green as that of Colbert in France.

Our larger cities might make a beginning by converting one of their high schools into a technical or scientific high school. This would entail large expenditures, but boards of education which go forward courageously will soon see paying results in the gathering to such centres of the highest young intellects of the Dominion. The effects of such schools upon manufactures are soon felt. As the great German chemist, Ostwald, recently declared, the most valuable kind of energy in a country is mental energy, and the more brains we succeed in putting into our goods the greater is their value. The kind of education we are pleading for is that which will teach us to combine more mental energy with the rough primal material. In the last analysis, the greatest factor in a country's prosperity is the intelligence of its people. Not many years ago there was practically no foreign market for Canadian butter and cheese. Professor Robertson, Dr. Saunders, Dr. Mills and their colleagues showed the dairymen how to combine more mental energy with their products and now the markets of the world are open to us on favorable terms. The Masseys, Cossitts, Deerings, etc., have so combined mental energy with our iron and wood that Canadian agricultural implements are sold as far as the antipodes. But we have only made a beginning. Governments, Dominion and Provincial, municipalities, and men of wealth who love their country, must look into this subject in the light of the enormous extent to which scientific training is being utilized in modern industries. We are in the engineering age. The rule of thumb days are gone. We cannot afford any longer to be without such a system of technical education as shall touch every industry and be within the reach of every Canadian youth.

The Summary Report of the Geological Survey of Canada, which receives more extended notice in another column, breathes a spirit of progress and of judicially tempered aggressiveness.

The desirability of employing undergraduates of the Technical Colleges as summer assistants is strongly urged. It is also urged that their remuneration be ample enough to prove an inducement to the best men. This is not only right but necessary.



The Director also points out that the value of the mineral production of Canada has increased by leaps and bounds, until it now amounts to seven times what it was twenty years ago. No corresponding increase is to be observed in the appropriations of the Government for the work of the Geological Survey.

The annual meeting of the Canadian Mining Institute, which is to be held in Toronto on March 6th, 7th and 8th next, promises to be of exceptional importance and interest. A very large attendance is anticipated of men representative of Canadian mining and allied industries, while, too, we understand, the Institute will have the privilege of entertaining as its guests a number of eminent American scientists and engineers, including President Van Hise, of Madison University, Prof. Leith, Prof. Kemp, and Mr. John Hammond. The programme, which we publish elsewhere in this issue, includes a list of upwards of fifty papers, many of which are on subjects of special significance and interest at the present time. Thus, to mention a few, Prof. Van Hise's paper on the "Geology of the Cobalt Area; Mr. Hiram W. Hixon's contribution on the "Smelting of Cobalt Ores," being an expression of opinion from an undoubted authority on metallurgical matters—suggesting a solution of a difficult problem—and Prof. Leith's paper on the "Iron Ores of Canada," are extraordinarily opportune and of great practical value. The Institute is prosecuting a most useful work and it is satisfactory to learn that its scope and influence is steadily increasing.

In a recent issue of *The Mining Journal* (London), Mr. Edward Ashmead, F.C.A. contributes an interesting article on mining companies' registration in Great Britain during 1906. Compared with the remarkable record established in Ontario last year, in this respect, Mr. Ashmead's statement showing a registration of three hundred and eighty-six new mining issues, with an aggregate nominal capitalization of £29,829,435 fades into comparative insignificance. This, nevertheless, is a gain over registration returns for the corresponding periods of the preceding two years, due, in large measure, to a revival of interest in British metal mining. Foreign promotions were fairly evenly distributed, South Africa heading the list with fifty-seven companies, which, however, were for the greater part reconstructions or re-organizations of existing undertakings. Rhodesia, meanwhile, appears to be gaining in favour, and the gold returns from there last year were over 150,000 ounces greater than in 1905. Copper mines, however, have been in great request, and Mr. Ashmead states that good copper properties offered in any part of the world were readily taken up. In this list Canada makes a rather poor showing with but eleven registrations, three of which were Nova Scotian undertakings and two British Columbian. The Cobalt excitement has yet to extend to the old world, as apparently but one concern preparing to operate in this new territory was registered in London in 1906.

Dr. Robert Bell, F.R.S., Chief Geologist of the Canadian Geological Survey, has been awarded the Cullom medal for the year 1906. This is a timely recognition of Dr. Bell's long and honorable service.

We learn, with great regret, that Mr. A. P. Low, Director of the Geological Survey, is critically ill at his home in Ottawa. Although strong hopes are entertained for his recovery, it will nevertheless be several months before he will be able to resume his official duties.

THE HON. MR. TEMPLEMAN

The Hon. Mr. Templeman (who, upon the creation of a Federal Department of Mines, will be appointed Minister of this important Department), was born at Pakenham, Ont., of Scottish parents, in 1844. He has been engaged the greater part of his life in the business of publisher.

About forty years ago he established the *Almonte Gazette,* which is still in existence and enjoys a considerable circulation. In 1884 he removed to Victoria, B. C., where he established, in association with other gentlemen, the *Times,* one of the most important dailies of the Pacific coast. Mr. Templeman, who had already taken an active interest in politics, became a Senator in 1897, and entered Sir Wilfrid Laurier's Administration without portfolio in 1902. Early in 1906 he was made Minister of Inland Revenue, after resigning his seat in the Senate and being returned for Victoria by a large majority. During the summer of last year the Geological Survey, which had formerly been under the jurisdiction of the Department of the Interior, was placed under Mr. Templeman's charge. Our photograph is by Savanah, of Victoria.

INDUSTRIAL PIONEERS OF CANADA

John James Drummond, born in Ireland, 1856, family removed to Canada while he was still quite young. He was educated in Montreal. Having a strong bent for mechanics, he determined to make it his life-work, and, after a thorough training in some of the best Canadian shops, he removed to the United States in the early eighties, and gained there a wide experience in blast furnace practice. Returning, in 1889, he joined his brothers and other associates in the newly formed Canada Iron Furnace Company, Limited, and designed and built the present Radnor furnace, reorganized and systematized the manner of securing the bog and lake iron ores of the district, and modernized the methods then in vogue in respect to the supply of wood and manufacture of charcoal.

Under his personal superintendency the enterprise was most successful, the product of the Radnor furnace

JOHN JAMES DRUMMOND

proving of such high quality that the brand "C. I. F." became famous, not only in Canada, but in the United States, Great Britain, France, Belgium, Austria, and indeed in Russian, to all of which countries "C.I. F." iron was regularly exported until the Canadian trade became so large as to absorb the entire output of the furnace, which was necessarily restricted in point of tonnage on account of the natural difficulties in the way of securing each year more than a certain tonnage of the bog and lake ores of the district.

In 1899 the directors of the Canada Iron Furnace Company, Limited, determined to undertake the manufacture of foundry iron, with coke as a fuel. The port of Midland, Ont., was decided upon as a site for the new enterprise, and Mr. J. J. Drummond was entrusted with the establishment of same. He designed the entire plant, together with a system of docks that have no equal on the upper lakes. The whole work of construction was carried out under his personal direction, and by December, 1900, the first Midland furnace was blown in, the then Premier of Ontario, Hon. Mr. Geo. W. Ross, with a large number of leading Canadians, being present at the official opening.

The Radnor and Midland works were the first modern furnace plants ever designed and erected by a Canadian. Since then Mr. Drummond has rebuilt and reorganized the Londonderry works, and all three plants are still under his management, with a fourth furnace contemplated for erection at Midland or other point in Ontario.

Mr. Drummond possesses that rare combination of a sanguine temperament with tenacity of purpose. His clear vision of the larger national issues, his faculty of inspiring his subordinates with affection and loyalty, and his tremendous capacity for work have enabled him to surmount difficulties which would have easily discouraged a lesser man.

Men of his type are Canada's best product.

MINES AND MINING AT COBALT

By Willet G. Miller.

A year has now passed since the publication by the Bureau of Mines of the second edition of the writer's report on the "Cobalt-Nickel Arsenides and Silver Deposits of Temiskaming." I am now requested by the editor of *The Canadian Mining Journal* to prepare an article on this mining camp for the first number of *The Journal*. It is, however, difficult for me to add anything of scientific interest to what was contained in my report. I have there given as fully as was deemed desirable the history of the discovery of the camp, together with an account of the geology and of the veins and their contained ores. Although during the last year much work has been done in the camp, little has been added to our knowledge of the character and modes of occurrence of the ores and of the geology in general of the field.

An account of the stock-jobbing operations which have been connected with the camp during the past year would simply be a repetition of what has taken place in many fields during the last fifty years or more, illustrating man's cupidity, together with the absurd credulity and ignorance, which the many have in connection with mining matters. Cobalt has offered the best field for the stock-jobber in mines that the world has probably ever seen. It is within a comparatively easy distance of the great centres of population in Eastern North America. A Pullman car can be taken to within a few hundred yards of some of the richest mines, and the massive silver and other minerals to be seen in numerous veins are of the character to serve the purpose of the promoter. It is doubtful if the losses will not be greater through the prices at which the stock in some good properties has been sold than by what is invested in the real "wild cats." Over a year ago, by means of interviews in the press and in his report, the writer felt it his duty to warn the public concerning the period of stock-jobbing and mining on paper that he saw ahead. He felt, however, at the time that this would do little good. It seems that the public must have its period of gambling in mines every seven years or so, a period about like those in which occur epidemics that sweep off certain groups of wild animals in our northern regions. It is doubtful wether one should sympathize much with the ordinary purchaser of mining stocks. He does not buy stocks as

a permanent investment, but with the object of keeping it for a rise in price and selling it to some other fellow before the crash comes. He is then more inclined to buy stocks controlled by men whom he knows to be successful boomsters than to seek the advice of someone with a sound knowledge of the mineral industry. Such being the case the chief injury that the genuine mining man feels the industry suffers from a boom is that after its collapse it is difficult to raise capital for the development of good properties. There might be mentioned another element in connection with the Cobalt field which has assisted the boomster. This is owing to the fact that the geolical structure of the field is somewhat unique and difficult to understand by one who has not made a careful study of it. Hence the opinions of men whose reputations have been made in other camps are often of little value in connection with the ore bodies at Cobalt.

the older properties during the past year, and some promising veins have been found on the borders of the producing area, notably in the eastern part of Coleman township and to the northward.

Revised Map.

During the last half of the year a party under my direction has been engaged on the detailed mapping of the more productive part of the area. This map, which will be published during the coming spring, has been plotted to a horizontal scale of 400 feet to the inch, and with ten feet contours. It covers an area about fourteen square miles in extent. In an east and west direction it extends approximately from Clear Lake to the western boundary of the township of Lorrain. Its northern boundary is the southern edge of the township of Bucke, while to the south it is bounded by a line running east

GILLIES LIMIT EXPLORATION. GOVERNMENT CAMP, DIABASE POINT, GIROUX LAKE

Characteristics of the Veins.

The most striking feature of the camp is the occurrence of numerous narrow veins, probably averaging less than four inches in width, and the great richness of these veins, unique in their mineral contents, in so far as is known in North America, in that they carry high percentages of cobalt, nickel and arsenic, associated with silver in the native state and in lesser amounts in compounds. The number of workable veins so far discovered is difficult to estimate, but it can be put at approximately one hundred. Others will be found, especially on the older producing properties. The method of prospecting for these veins is somewhat unique, consisting of digging trenches in a more or less systematic way through the soil where the rock is not exposed. The surface of the bed rock being uneven, thethickness of the soil varies greatly, and the depth of the trenches is from a few inches to fifteen feet or more. Many miles of trenches have been dug in the district, and within certain areas the work can be carried on with the certainty of discovering veins before a large part of a mining location has been examined.

A considerable number of veins has been discovered on

and west through the northern part of the Gillies timber limit. The productive veins, or those likely to be productive known at the time our work was done, are plotted to scale. While this map gives, of course, a more accurate knowledge of the boundaries of the exposure of the various series of rocks—Keewatin, Huronian and diabase—our work on it has not changed our views concerning the origin and relationship of the members of the series.

The map, which was published from our work in 1904, of which 16,000 copies have been used by those interested in the field, has served its purpose. When the field work on it was begun in 1904, the area which is now the township of Coleman was literally a *terra incognita* so far as maps were concerned. We had not only to map the lakes and streams and to show as far as practicable the distribution of the rocks, but we had also to determine the relationship of the rocks as well. In addition to this we had, of course, to study and describe the rare and unique group of minerals, so far as North America is concerned, found in the veins. Comparatively little prospecting was done in 1904, and the map was ready for the first prospectors who entered the field in 1905. If we had had either more funds at our disposal or more time for the

work we could have prepared a more perfect map, but our desire was to have the map ready for the prospector, instead of waiting and publishing what may be called a *post-mortem* sheet, such as has been the case in most mining fields. Owing to the removal of the trees over much of the area and to the fact that much work has been done in the way of stripping the surface, we are now able to determine the boundaries of the various formations with greater accuracy.

Structure of the Area.

Although the geology of the area is probably known to most of our readers, it may be well to summarize it for the purpose of this article. The oldest series of rocks in the district of which we have any knowledge is what is called the Keewatin. This essentially a complex igneous, volcanic, series, consisting essentially of greenstone and other basic rocks, associated with which in minor amount sare granite, porphyry and acidic types. The Keewatin is called a complex series. because it is made up of rocks which not only differ in their chemical and physical characteristics, but which also represent different periods of eruption, these eruptions having probably taken place throughout a great interval of time. The term Keewatin is simply an age name, which is applied to this interval of time.

At the close of the Keewatin age, and after the igneous rocks belonging to it had been disturbed and altered, there took place a great intrusion of granite, which cut through the Keewatin series. To this granite, which is extensively developed in the township of Lorrain, the name Laurentian, another age name, is given.

After the eruption of the granite the surface of the earth in this part of the continent was subjected to a prolonged period of erosion or wearing down action. Valleys in some parts of the area were cut deep into the surface, producing a landscape more rugged than that of the present day. Then there was a gradual subsidence beneath the waters, and the valleys became filled with gravel, sands and clays, more or less impure. which finally formed a mantle deep enough probably to cover the hill tops.

This period of subsidence, during which gravel and other fragmental material were deposited, is known as the Huronian. It undoubtedly representes a great length of time.

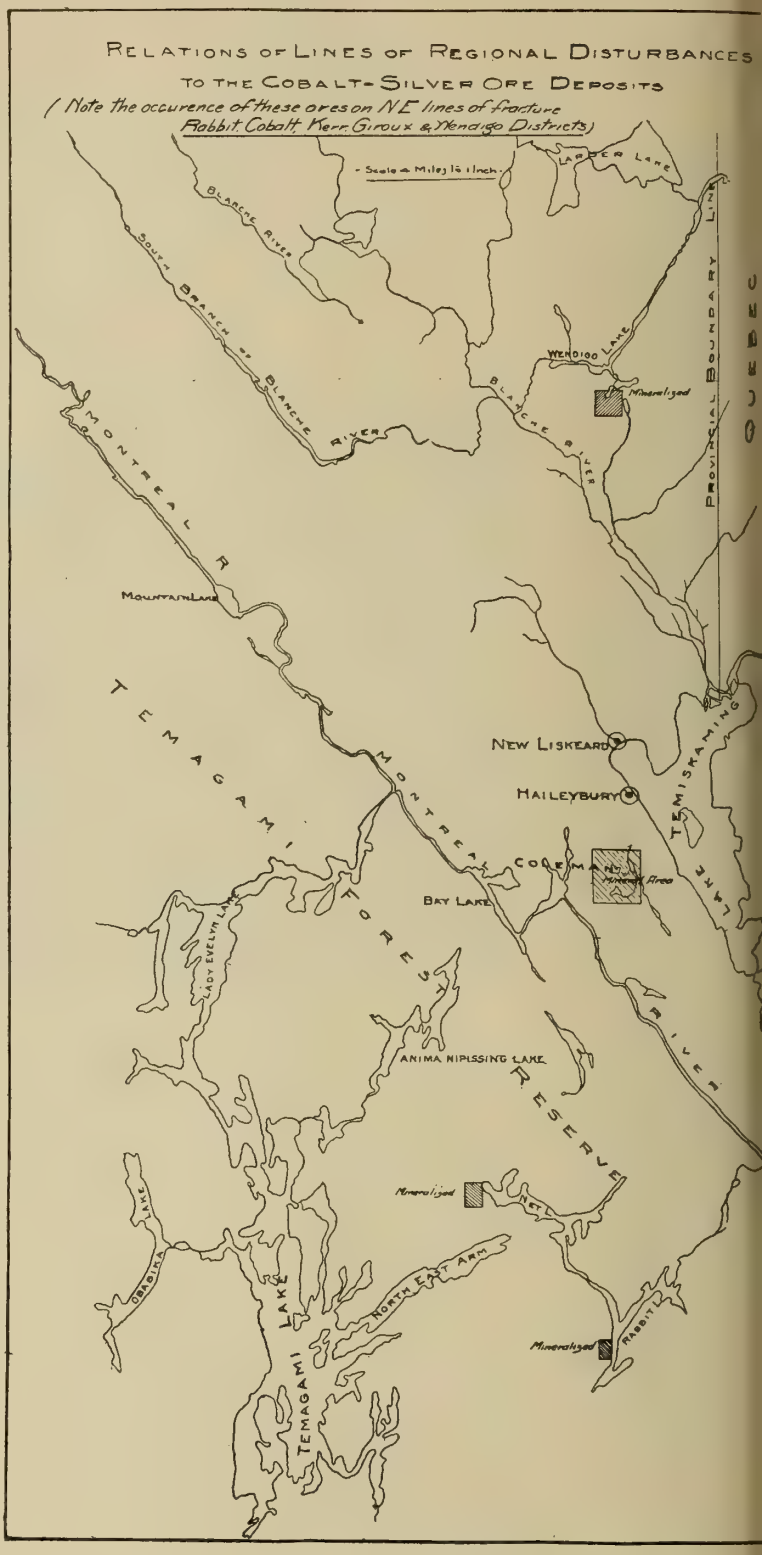
As stated in the writer's report, some of the coarser bouldery material in the Huronian has the appearance of a glacial deposit, giving the impression that glaciers may have been active for a time during the far distant Huronian period. There are some points in connection with these coarse fragmental series which are, however, difficult to reconcile with a glacial origin of the material. We know, for instance, that some, at least, of this material has originated in place and represents the weathered surface of the Keewatin and Laurentian on which it is deposited. Moreover, there is no unconformity, in so far as the writer knows, between the underlying slaty graywake and feldspathic quartzite series and the overlying conglomerate, such as would occur if the conglomerate were of glacial origin. Striations on boulders in the conglomerate may be produced either by the slight movements which can be seen to have taken place in the rocks or probably by the change in volume of the bolders through the serpentinzation of chloritization of their surfaces.

GILLIES LIMIT. GOVERNMENT GEOLOGICAL PARTY

The term agglomorate, meaning fragmental material ejected from a volcano, is a misnomer when applied to these Huronian conglomerates.

After the deposition of the Huronian boulders, gravel and sand, and after these had become hardened to conglomerate, greywake slates and impure quartzites respectively, another eruption of igneous material took place which invaded all the older series—Keewatin, Laurentian and Huronian. Much of this diabase spread horizontally through the other series, from east to west, across about the eastern half of what is now the more important part of the productive mineral area. In some parts of this area, which has been worn down several hundred feet or more since the diabase eruption, masses of Keewatin are in places found overlying the diabase. Along the western face of the main mass of the diabase shown on our map, east of Peterson Lake, the Huronian series can be seen to dip gently under the diabase. On

its western edge the diabase is now only a foot or so in thickness at some points. At Diabase Mount and at the Devil's Rock it can be seen to be at least 300 or 400 feet thick. Originally the diabase probably had a mushroom-like form, spreading out horizontally between the older rocks, which have now to a large extent been worn away from above.



Formation of Veins.

The veins, which are being worked chiefly for their silver content, but which also carry values in cobalt, nickel and arsenic, appear to have been formed at the period when the cooling of the diabase was taking place. On cooling the diabase would contract, producing fissures, not only in its own mass, but also in the rocks with which it was in contact or which lay adjacent to it. Some fissures may, of course, have been formed at the time of the eruption of the diabase, but there is nothing to prove that any of those of economic importance were produced by this disturbance. At points where it is possible to make observations, it is found that the metal-bearing veins pass downwards from rocks intruded by the diabase into the diabase itself. This shows that the fissures in the diabase are contemporaneous with those of the surrounding rocks.

The Huronian rocks, being more readily fractured than either the diabase or the Keewatin, it is natural that the greater number of the veins are found in them. Many of the veins in the Huronian occupy openings which have the appearance of being ordinary joint cracks, as if these rocks during gradual settling of the area after the diabase eruption had be affected by jointing. The Keewatin, on the other hand, at a distance from the diabase, has not as yet proved to contain veins of economic importance, and some veins carrying good values in the Huronian have been found to be practically barren, especially of silver, when the underlying Keewatin is reached. In the eastern part of the more productive area, where the Keewatin comes in contact with the diabase, and where masses of it rest on the diabase, a few good veins have been found on it. The Keewatin, under these conditions, while being very tough as compared with the easily jointing Huronian, could not fail to be fissured, floating as it does at times on the diabase.

Origin of the Ores.

It seems pretty clear that the ores of silver, nickel, cobalt and arsenic were deposited from solution in the heated, impure water which followed the diabase eruption, representing the end product of the volcanic action. As to the source of the various metals, *i.e.*, as to whether they were carried up from great depths by the heated waters, or whether they were wholly or partly leached from the rocks through which the waters passed, it is impossible to give a definite answer. The metallic silver now contained in the veins existed originally, in all probability, in the compound form. The cobalt-nickel ores were deposited in the cracks and fissures at an earlier period than the silver. Some fissures were completely filled with the cobalt-nickel ores and their associated gangue material, chiefly calcite, at this early period. Afterwards there was a slight movement probably due to the gradual settling or contraction of the area owing to the continued cooling of the diabase or from some other cause. This slight movement disturbed many of the veins already filled, producing cracks and openings in them, through which percolated the silver-bearing solutions. Some of the cobalt-nickel veins, however, even in the Huronian, escaped this disturbance. Hence we find that they do not contain silver in economic quantities. The question has been asked, why, if a vein

passes from the Huronian into the underlying Keewatin, it should, if it carries silver in the former formation, not contain it in the latter. The answer to this seems to be that, while the disturbance after the deposition of the cobalt-nickel ores was sufficient to affect the Huron-

ian rocks, it was not, in many cases, of great enough magnitude to disturb the veins in the tougher and more massive underlying Keewatin. It may be added that while some strong veins in the Huronian continue into the Keewatin, others end abruptly when the Keewatin is reached. At times strong veins in the Huronian are succeeded in the Keewatin by several branching cracks and fissures.

Extent of Territory.

While the area in which the veins rich in silver are found is only about six square miles in extent in the township of Coleman, with two or three locations in the township of Bucke, the area over which ores of Cobalt have been found is much larger. Cobalt ores have been shown to occur at various points about 30 miles north of Cobalt station, and they have been found in small quantities about the same distance to the southward. To the westward these ores have been found in the western part of Coleman, near Portage Bay, and also in the Temagami Forest Reserve, 25 or 30 miles from Cobalt. In the writer's report attention was drawn to the striking regularity of the great water courses of the district, especially those running from northwest to southeast. It was also shown that there is a less striking system of lakes and streams which follow northeast-southwest lines. These lines probably represent faults or folds, and can be called in a general way lines of weakness. The accompanying diagrame shows the relationship of some of the more important of these lines. The occurrence of the cobalt ores seems to be connected with the northeast-southwest lines. It will be noticed that the Cobalt area proper is on one of them. Then the discoveries of cobalt which have been made near Wendigo Lake are along another line, consisting of a chain of eleven small lakes. In the vicinity of Rabbit Lake, to the southward, where a little cobalt has been found, we have another similar line.

Production.

The following table shows the production of the camp in 1905. Statistics for 1906 are not yet complete, but it can be said that the output of silver was worth approximately $3,500,000. Much of this ore was taken from the cuts and from shafts and drifts during the progress of the development work. Little stoping has been done on some of the most important properties.

	Quantity.	Value.
Tons of ore shipped	2,144	.....
Silver, ounces	2,441,421	$1,355,306
Cobalt, tons	118	100,000
Nickel, tons	75	10,525
Arsenic, tons	549	2,693

The silver contents of the ore in 1905 averaged 1,138.72 ounces per ton of ore.

Refining.

Up to the present time there has been a loss of nearly 25 per cent. of the value of the average grade of ore shipped, owing to the lack of proper refining methods. During last year practically nothing was received for the cobalt, nickel and arsenic contents of the ore, although the percentages of the substances average about 6, 3 and 30 respectively.

Some of the ore has been partially treated at Sudbury, but the greater part of it has been shipped to the vicinity of New York.

Plants for the treatment of the ores are now in course of erection at North Bay and Sturgeon Falls, and associations of the mine owners are arranging for the treatment of the ores at Deloro, in Hastings county, and in the Niagara peninsula.

Revenue From the District.

While many individuals have made fortunes in the district, eight or ten Canadians having become millionaires, the revenue derived by the Government has also been important. The mining rights to Cobalt Lake were sold by tender for $1,085,000, and those of Kerr Lake for $186,500. In addition to this, 25 per cent. of the gross value of the ore at the pit's mouth is received from one mine, and the Railway Commission. representing the Government. receive svarying percentages on the railway right of way, and on the town site of Cobalt The development of the district has been of great benefit to the Government railway, the Temiskaming & Northern, and to the agricultural district to the north.

At the last session of the Legislature an appropriation was voted for the exploration of the Gillies timber limit, the mineral rights of which had been retained by the Crown. During the past few months a party, under the writer's direction, has been engaged in preparing a geological map of the northern part of the limit, and in searching for veins, several of which have been discovered. The most important of these was discovered on July 19th while trenching through a thickness of four or five feet of soil. A shaft was then sunk in the rock outside of the vein to a depth of 75 feet. A cross-cut was made to the vein, and at the present time a drife has been made along the vein for a distance of 150 feet, showing ore of a high grade. This vein having been developed directly by the Government, represents a unique mine in North America, the first and only one worked directly, it is believed, by a Government.

ONTARIO MINING LEGISLATION

Owing to the recent discovery of minerals in the Cobalt district and the great development of that part of the Province, the Government of Ontario introduced, at its last session, an Act relating to mines and minerals, known as "The Mines Act, 1906." This Act supercedes the former Mines Act, and prospectors should have knowledge of those parts of the Act which direct the manner in which title may be acquired to mining properties.

It would be impossible in an article such as this to discuss the Act in detail, but the writer will endeavor, in as small space as possible, to give some information to intending prospectors and others interested in mining who have not hitherto become familiar with the requirements of the law.

The first thing a prospector must do if he intends to discover and explore mining properties, is to take out what is known as a miner's license. This license can be procured from the Minister, Deputy Minister, or any mining recorder by any person over the age of eighteen years upon payment of a certain fee. The fee for a license for an individual is $10, unless the license is procured on or after the 1st September, 1906, and prior to the 1st April, 1907, when the fee is $5. The fee for a license for a partnership or incorporated company varies according to the number of members of the partnership, and the authorized capital of the company. All licenses

expire at midnight of the 31st day of March after their issue, but are renewable. As noticed above, any person over eighteen years of age may procure a license. It is also provided that, although a licensee may be under the age of twenty-one years (which, generally speaking, is the age at which persons can by contract create legal liability) he shall, as regards his mining property and liabilities contracted in connection therewith, be deemed to be of full age.

When a person has procured his license he is in a position to prospect for minerals, either on his own behalf or on behalf of any other license on Crown lands and on lands, the ores and minerals whereof have been reserved by the Crown, except lands which are staked out and occupied as a mining claim or are under working permit, or are withdrawn from exploration by any Act or order-in-Council. (Prospectors in the Forest Reserves must have an additional permit to be allowed in such reserve.) If he makes a discovery of valuable mineral he must then "stake out" his claim. A mining claim and area comprised in a working permit in unsurveyed territory must be laid out with boundary lines running north and south and east and west, and must not exceed a square of twenty chains containing forty acres; but an irregular portion of land lying between two or more claims may be staked out with boundaries coterminous with the boundaries of adjoining claims, provided such irregular claim does not exceed forty acres. In townships which have been surveyed into sections of 640 acres or 320 acres, a mining claim must not exceed forty acres, and in townships which have been surveyed into sections of 200 and 100 acres, a mining claim must not exceed fifty acres. In order to "stake out" a mining claim the licensee must plant a discovery post of wood or iron upon an outcropping or showing of mineral; upon this post must appear the name of the licensee making the discovery. If the discovery is made on behalf of a licensee other than the discoverer, the name of such other licensee and the number of his license must also appear on the post. A post must then be planted at each of the four corners of the claim in the following order: Post No. 1 at the northeast corner, No. 2 at the southeast corner, No. 3 at the southwest corner, and No. 4 at the northwest corner. The number in each case to be on the side of the post which follows it. The particulars required to appear on the discovery post must also appear on No. 1 post, and if the claim is in a township surveyed into lots the sub-division or part of the lot intended to be comprised in the claim must also appear. If there are standing trees upon a mining claim the licensee must blaze the trees on two sides only, and cut the underbrush along the boundary line of the claim, and also blaze a line from No. 1 post to discovery post and mark on No. 1 post the distance to the discovery post If there are no standing trees he shall indicate the outlines of a claim and also a line from No. 1 post to discovery post by planting pickets, not less than five feet in height, at intervals of not more than two chains, or by erecting at the same intervals monuments of earth and rock not less than two feet in diameter at the base and at least two feet high. No more than three claims may be staked out and recorded by a licensee in any mining division during the period covered by a license year.

When the licensee has staked out his mining claim he must, within fifteen days thereafter (except where the claim is more than ten miles from the office of the recorder, when an additional day is allowed for each additional 10 miles), furnish to the mining recorder a plan of the claim showing the posts and the distances from each other in feet, together with an application giving the name of the licensee interested and the number of his license, the name (if any) of the claim, and its locality, as indicated by some general description, so that the recorder can lay down the claim on his office maps. If the claim is in a surveyed township the portion of the lot intended to be comprised in the claim must also be given. If the outlines of the claim are not regular the length of such outlines shall be given, and also the cause of their not being regular, and the situation of the discovery post by distance and direction from No. 1 post. The application must also state the time of the discovery, when the claim was staked, and the date of the application. Both the plan and application must be verified by oath. In addition to the foregoing requirements, the discovering licensee must make an affidavit showing the discovery of valuable mineral and that "the deponent has no knowledge and has never heard of any adverse claim by reason of prior discovery or otherwise." The affidavit must also state the locality of the claim, as indicated by some general description or statement. This affidavit has caused considerable difficulty. Suppose the licensee applying has heard of a prior claim which he knows to be invalid, can he say that he has never heard of any adverse claim? It seems clear that he cannot truthfully do so. If this is so, is it sufficient for him to swear that he never heard of any adverse claim except (mentioning the claim of which he has heard)? Is the recorder bound to accept an affidavit in this form? Such an affidavit was presented to the recorder, who refused to file the application. The matter then came before Mr. Justice Anglin, who held that the affidavit might contain exceptions, and ordered the recorder to accept the affidavit and file the application. This decision has been appealed from to a Divisional Court, but the appeal has not, at the date of writing, been argued.

A point to be remembered is that if the mining claim is filed against land, the surface rights of which are owned by a settler, the applicant cannot get a certificate of record until he has settled with such surface owner as to compensation for damages to the surface. If he and the owner are unable to agree, the Mining Commissioner has power to settle the amount. After this is done, and after sixty days have elapsed from recording of the claim, if no dispute as to the right of the applicant has been recorded, and if the claim is passed by the inspector, the applicant may procure a certificate of record of his mining claim. When the certificate of record is granted, it shall, in the absence of fraud on the part of the licensee, be final and conclusive evidence of the performance of all requirements of the Act, except working conditions, and in the absence of fraud the claim shall not be subject to forfeiture, except for non-compliance with working conditions.

After a licensee has procured his certificate of record he must do certain work upon his claim During the three months succeeding the recording of the claim he must carry on mining operations to the extent of not less than eight hours per day for thirty days. During each of the two years following the expiration of the three months he must do similar work to the extent of not less than eight hours per day for sixty days; and during the third year he must do similar work to the extent of not less than eight hours per day for ninety days. This work may be performed in a less period if the licensee desires. The licensee must make a report, verified by oath, to the mining recorder, showing that the working conditions have been complied with. He

may then get a certificate from the recorder to that effect, and if he applies within three months from the expiration of three years and three months from the recording of the claim, then upon payment of the purchase price he is entitled to his patent, which gives him a title to the property which is not subject to forfeiture. Special provisions are in the Act, allowing the work to be done on one of several adjacent claims owned by one person.

If a licensee desires to obtain exclusive possession of an area of mining lands, not exceeding forty acres in extent, open for exploration with a view to discovering minerals, he may procure what is known as a working permit upon complying with certain conditions. He must first stake out the boundaries by planting a post at each of the four corners. These posts are to follow in the same order as in the case of a mining claim. If one or more of the corners of the claim fall where the nature of the ground renders the planting of posts impracticable, as, for example, if one of the corners is under water, such corner or corners may be indicated by planting at the nearest suitable point a "witness post," which shall contain the same marks as corner posts, together with the letters "W. P." and an indication of the bearing and distance of the site of the true corner from such witness post. The licensee shall write on No. 1 his name, and, if he is staking on behalf of some other licensee, he must also give the name of such other licensee and the number of the license of such licensee and the date of the planting of the posts. He must then, if there are standing trees, blaze the trees upon two sides, and cut the underbrush along the area where there are standing trees. The outlines of the area may be marked in the same manner as in the case of a mining claim, except that pickets or monuments of earth or rock may be at intervals of four chains instead of two, as required in the case of a mining claim. The licensee must write upon No. 1 post "working permit applied for," and must make three rings or notches, not less than a quarter of an inch deep and not less than two inches apart, beginning at a distance of not less than two nor more than three inches from the top. The licensee shall also make a trench not less than six inches deep for a distance of not less than six feet, beginning at No. 1 and running along the boundary line between No. 1 and No. 2, and also a trench of the same depth and length along the boundary between No 1 and No. 4. If the area is in a surveyed territory the licensee must indicate on No. 1 post the portion of the lot upon which the area is situated. The area must not exceed forty acres in a mining division, or twenty acres in a special mining division. The applicant must then furnish to the recorder an application in duplicate, indicating the location of the area by reference to some ascertained boundary or locality, and he must furnish to the recorder within fifteen days proof of the planting of the posts and their distances from each other, together with an application in writing with proof under oath of the name of the licensee interested and the number of his license; such general description as will enable the recorder to lay down the area on his office maps, the time when the posts were planted and the area staked out, and evidences on oath "that the land at the time of its being staked out was not in occupation or possession of or being prospected by any other licensee, and that the deponent has no knowledge and never heard of any adverse claim by reason of prior discovery or otherwise"

It will be noticed that this affidavit is very similar to the one required to be made when applying for a mining claim, and the question has arisen, may the affidavit state that the deponent has never heard of any adverse claim except (mentioning a claim which he thinks not to be a *bona fide* claim)? The Mining Commissioner has held that there can be no exception mentioned in this affidavit, and that if the applicant cannot make the affidavit without any exception he cannot get a working permit. This decision, however, has been appealed against, and is now awaiting the judgment of the Divisional Court.

After the licensee has filed his application he must procure from the recorder a certificate of his application and affix it within three days after it is granted to No. 1 post, unless the area is more than 10 miles from the recorder's office, when an additional day is allowed for each 10 miles. After sixty days, and within seventy days from the staking out of the area, the licensee must apply for a working permit from the mining recorder. A working permit will not be granted where the surface rights have been sold until the licensee has arranged compensation with the owner, in the same manner as an applicant for a mining claim. An application for a working permit gives no right to exclusive possession until the permit has been granted. The licensee, after procuring his working permit, must search for minerals to the extent of not less than eight hours per day for five days in each week, during the six months next following two weeks from the issuance of the permit. Once it is granted the holder of a working permit has a title such as the practical miner wants, absolute possession, so long as he works the property, convertible into a patent as soon as his work results in a discovery which will pass inspection. If that cannot be obtained in three years the miner is as well off without a patent. The Act provides that all discoveries are subject to inspection by the inspector, but the writer will not deal with this branch of the Act at the present time. All papers prior to patents are filed in the offices of the recorders of the respective divisions and many details must be observed, as to most of which the recorder can furnish information. Once the application for patent is made, the papers go to Toronto, the land fees are paid there, and the patent when issued carries the land under the Land Tables Act, and it is governed by the ordinary land laws, save that to carry on the business of mining, by person or corporation, the annual license must still be taken out.

THE UNDEVELOPED MINERAL RESOURCES OF CANADA

At a recent meeting of the McGill Mining Society, Dr. Frank D. Adams, Logan Professor of Geogogy at this University, delivered an interesting address on the subject of the undeveloped mineral resources of the Dominion. The speaker, in his introductory remarks, stated that the public generally failed to grasp the relative importance to Canada of the mineral industry. In the last twenty years the mineral output had increased from a valuation of the million dollars per annum to approximately seventy million dollars, and in view of enormous mineralized territory as yet unworked, it might not be too much to expect that Canada in due course would become the greatest mineral producing area of the world. "Now," the lecturer proceeded, "it becomes a matter of interest to inquire whether this output, which has increased so extremely in the past twenty years, will continue to do so. If we may depend on geological science, the reply is in the affrmative. From

the Researches of the Geological Survey we now know, aproximately, the extent of our mineralized areas and the localities in which minerals will probably be discovered."

Referring first to coal, the lecturer pointed out that coal occurred in this country both in the carboniferous and cretaceous formations, the coal fields of the Maritime Provinces occuring in the former, while those west of the Rocky Mountains belonged to the cretaceous period.

Although the area of trap rock in Nova Scotia is comparatively small when compared with New Brunswick, teh coal seams here are much thicker and constitute the most important of the Eastern coal areas.

While no recent estimate has been made of the probable extent of this field, the Sydney field alone was known to contain at least one thousand million tons of coal, and this represented a very small section of the undeveloped coal resources of Cape Breton.

In New Brunswick there is a great distribution of the carboniferous system, but the coal fields are thin; in most cases only twenty to fifty feet below the surface. It is, nevertheless, estimated that thi sarea contains about one hundred and fifty millions of tons of coal at present undeveloped.

Again, all along the southern side of the Baie of Chaleurs are undeveloped coal fields, dipping into the sea and flooring the whole Baie, and these areas will doubtless in time be worked.

The most easterly development of coal in the western system is in the Souris River district, in Manitoba, where lignitic coals are mined. The quality of the product improves as one proceeds westward, and good anthracite is found in the Rocky Mountains. Dr. George Dawson has estimated that in the district of Lethbridge there are about five and a half million tons of coal under each square mile; in the district of Blackfoot about nine million tons under each square mile; and at Medicine Hat about four million tons under each square mile. Hence, in this section of the country we have coal in great quantities, near the surface and easily worked.

Again, in the great Crow's Nest Pass coal area, according to an estimate made by Mr. James McEvoy, there are in the vicinity of twenty-two thousand five hundred and ninety-five million tons of available coal. Further north, near Banff, are extensive fields of anthracite; while beyond are the coal area sof the Peace River and of the districts between Clearwater and Red Deer River, where recently was found twenty-four seams with an aggregate of ninety-five feet of workable coal, as well as other discoveries of value. Along the proposed route of the Grand Trunk Pacific coal fields have been discovered, and when this line is completed it should result in the development of new and important areas.

The gold production of Canada has recently shown a decrease, largely on account of the exhaustion of the rich Klondike placers. But gold is found in nearly all the Provinces of the Dominion. Nova Scotia for many years has produced largely, but while the quartz is rich, the veins are narrow and somewhat expensive to work.

There are also indications of possible gold discoveries in New Brunswick. In the Eastern Townships alluvial gold has been found in the Chaudiere valley, but the section has not as yet proved regularly productive. Then on all the streams running into the St. Lawrence to the north, in the Laurentian country, gold exists, though heretofore it has not been found in payable quantities. A gold property on the Riviere du Loup en Nant, however, was worked for about a year, and yielded sufficiently well to pay expenses. So that in this area we have a gold field which at some future time may possibly be worked to advantage.

Again, there are the gold fields in the Hastings district of Ontario. The gold here is associated with a great intrusion of granite, where we often find mineral deposits. The veins here are rich, though pocketty. In the Rainy River country some forty or fifty mines were operated at one time.

Crossing the plains fine gold is found in the lands of the Saskatchewan river; and with adequate equipment these lands might be made to yield a considerable amount of gold. In British Columbia we have great gold fields; and, too, in the Yukon. In the Klondike section the cream of the gold fields has been skimmed, but all through this country there are great auriferous deposits, which with the aid of capital should prove very profitable to work. Quite recently, however, valuable deposits have been found by a member of the Geological Survey. In the Lake Bennett district quartz reefs have been discovered from two to fourteen inches wide and traceable for long distances. These veins contain not only native gold, but gold in association with tellurium, and have already yielded results up to five thousand dollars per ton. Hence we are gradually extending our mineral producing areas.

In British Columbia, which is after all but a continuation of the California mountain system, there is every reason to anticipate the discovery of new rich alluvial deposits; and the geological conditions are such that we may expect that country, when fully explored, to prove a second California in point of mineral richness.

Canada, as is well known, is the greatest nickel producing country in the world. In 1905 the Sudbury mines produced upwards of seven and a half million dollars worth of nickel. These valuable deposits occur in the Huronian, the great mineral-bearing rocks of North America. The mines were first worked for copper, but the ore proving very refactory to smelt led to the discovery that it contained nearly as large a percentage of nickel.

In addition to the properties now being worked, there are a number of mines in the district which have been partially developed, but from which production is not being made, the operative properties supplying fully the present market demands. Then nickel has also been found to the south, outside this area, and still other discoveries will undoubtedly be made, as we have the same geological conditions in different localities. These nickel deposits are sufficiently extensive to supply the world's requirements in this metal for many generations, and the industry, as we have seen, is capable of great expansion.

Passing next to copper, we find from statistics that Canada produced last year over seven and a half million dollars in this metal. What was remarked of nickel in Ontario applies equally to copper, and all through the Huronian belt we find valuable deposits of copper and nickel. In the Temagami district rich discoveries have also been made, and throughout the area the indications are most promising. British Columbia, however, is the great copper producing Province of the Dominion. To this output Rossland is a considerable contributor, though its record is eclipsed by the Boundary District, where are found enormous deposits of low grade ores, which can not become exhausted for many years to come. Farther west, the Geological Survey has reported the

occurrence of considerable deposits of copper, which should prove very valuable when developed; while on Texada Island and the Mainland coast important copper mines are being developed. It may, in short, be said that the copper resources of the Dominion are only now beginning to be exploited.

Until recently the greater proportion of the silver mined in Canada was derived from the galena deposits of the Slocan and East Kootenay districts of British Columbia. But some two years ago the phenomenally rich Cobalt silver area was discovered in Northern Ontario, in the same area as the copper, from which, in 1906, a production of something like six million dollars was made. All the leads have been confined to a limited area in this Huronian belt, and there is no reason why equally rich mineral deposits should not be found in the same formation northward.

On the south shore of Lake Superior we find there are belts of Huronian rocks extending into Michigan and Minnesota. These contain immense deposits of iron, and the greatest deposits of iron in the world are just south of Lake Superior. Unfortunately, so far as has been ascertained, the values in these iron ranges decrease when they extend into Canada. But in Michipicoten we have a great iron range, in which have been developed the Helen and other iron mines, and throughout the Huronian rocks low grade ore occurs in considerable quantity. In particular, large deposits have been found in the Temagami district. In the north, in Labrador, extensive deposits of iron have been reported by Mr. A. P. Low, of the Geological Survey, while south of Georgian Bay iron also occurs. In the west, iron of good quality has been found in East Kootenay, while there are extensive occurrences on Texada Island and on the west coast of Vancouver Island, which in due course may be conducive to the establishment of an important industry.

The great demand that has arisen for concrete, for building and other purposes, perhaps justifies a word in reference to the resources of the Dominion in this respect. It may, in fact, be said that in almost every Province we have excellent limestone in unlimited quantity, from which to manufacture cement, and already a cement industry is being established in Canada, which is bound to grow to considerable proportions.

After referring to the possibility of the discovery of diamonds in the Temagami and iron districts in the Huronian belts, the lecturer concluded his remarks by reiterating his belief that Canada has not only great supplies and reserves in coal and mineral, but vast resources as yet undeveloped.

CASSIAR AND THE BERRY CREEK MINE

By Clive Phillips-Wooley

There are some countries which spring at once into notoriety, and are successes from the finding of the first "float" like Cobalt, and there are others which have their preliminary flutters, their subsequent period of comparative neglect, and their ultimate revivals, or second births, like Cariboo.

In spite of some disappointments in the past those who know him believe that "Hobson of Bullion," now that he is to have a free hand and all the money he wants, will make Cariboo the biggest thing yet in hydraulic mining.

The writer doubted of this once himself, but five years of practical experience in hydraulic mining (on a smaller scale it is true) has taught him the necessity of big outlay to achieve success in a big thing.

Cassiar belongs to the same class as Cariboo, which it resembles a good deal in character and history. Between them they make up the northern half of our great Province, and the gold we find in both is found on ancient river channels, probably belonging to the preglacial era.

Like Cariboo, Cassiar had its early rush of "cream skimmers," poor but energetic individual miners, who fought their way into the country in spite of all difficulties of transportation, found gold, and dealt with the richest and most obvious deposits of it successfully, and when they had exhausted the very richest spots which alone could pay under such circumstances as they had to contend with, abandoned the country until the era of companies, hydraulic mining and Guggenheims should arrive.

In Cassiar in 1873, Thibert and McCullough and others, located claims upon Dease Creek, Thibert Creek and McDames, and from these the pioneers and a few thousand of similar character took, with the rudest appliances, some $4,500,000 worth of gold dust; at least the Government collected upon that amount, though how much more was won must be a matter of conjecture.

In those early days, men went by steamer to Wrangel from Victoria; thence by canoe or over the ice up the Stickine for 150 miles, thence they had to pack over a forest trail for 72 miles, boat across Dease Lake and climb in from there to the various creeks upon which their claims lay.

If you will compute how much in the way of grub, blankets and tools, you could transport for yourself over such a route (if you were man enough to get over it at all) and then multiply that amount by three to make allowance for the difference between a western hard-fist and the ordinary man, you will be able to judge of the length of time these men could stay to mine in each season.

The whole of a normal season to-day is only 150 days, but luckily it is not difficult to mine for the whole 24 hours of each day, and the difficulties of frozen ground, big boulders and cement are for the most part absent.

Under such conditions it is not wonderful that the first excitement soon subsided, and by the early eighties the country about the Stickine settled down to its primeval silence. This was the period of the white hunters who wandered about the great river and the lands between Telegraph Creek and the Liard, taking toll of the big game which to-day attracts such a number of sportsmen from the different centres of wealth and civilization.

Then once more the cry was "gold," this time in the Klondike, and British Columbia had the chance of its life, and missed it, because the Senate of the day was afraid that Messrs. Mann and Mackenzie might make too good a thing out of their grant of snow and ice in return for an all-Canadian route, which would have given to our coast towns the trade which has built Seattle. The Senate probably saved Messrs. Mann and Mackenzie some initial disappointment, and set back Victoria half a century, since such trades as that of the Yukon are not offered even in the West more than twice in a hundred years.

About this time various smaller companies sprang into existence, the Cassiar Central Railway Company, which preceded Mann and Mackenzie, and also ended in disaster; the Casca Trading & Transportation Company, which went out of business without a debt and without

a nickel, setting a good example perhaps of business morality and affording an example of the unwisdom of trying to rival the old Hundson Bay Company—and some others.

Eventually, when everyone had lost all the money he had to lose, some of the members of these companies got hold of a piece of property on lease upon Thibert Creek and settled down to learn mining. Their adventures would furnish material for a Ballantyne for life, and what they don't know about the difficulties of transportation and the charms of opening a vast hydraulic property without working capital (assisted fortunately by contributions from the sluice boxes), is scarcely worth consideration.

But luck (you can spell it differently if you please) and the sure knowledge acquired by extensive preliminary tests, that the gold was there, pulled them through, and to-day the Berry Creek Hydraulic Mining Company has probably a better record than most mining properties in British Columbia.

Originally it consisted of seven leases, worked by two No. 2 and two No. 4 giants, and from 400 to 600 miners' inches of water. All that nature could do for us except as to transportation had been done. No one need want a better dump, and in the other essentials of hydraulicing we were fortunate, but we had our business to learn, and every experiment we made showed us that our deposit was larger than we had ever dreamed, and richer, in that, in addition to the coarse gold for which we were mining, we had a good deal of fine gold and a very considerably quantity of osmiridium, of the value of which we had at first no knowledge. All this had been going into the dump. To-day the property consists of ten leases of eight hundred acres each in one continuous body, fronting Thibert Creek for 15,000 feet, the deposit varying in width from 300 to 600 feet, and in height from 50 to 200 feet or more. Our manager in 1905 put the average width at 350 feet and the height at 125 feet, giving an estimated gravel deposit of about 30,000,000 cubic yards, of which not more than 450,000 cubic yards had been washed by the company, and perhaps 100,000 by former miners, of whom one gang took out $80,000 from a piece of ground which the present company could handle in a month.

To-day the mine is being worked by No. 6 giants and 1,000 inches of water, the continuation of which, throughout the season, has been assured, but to work the mine from the best possible business basis, even this should be doubled, as it could be if the necessary money were forthcoming. It is obvious that if the gold in such a deposit could be taken out in three years instead of in sixty, with the same fixed charges, Government fees, manager's and other salaries, the saving in cash in the long run would be enormous.

The net result of the mining operations then, to date may be summed up very briefly. We have at last made, opened and equipped our mine thoroughly up to the standard referred to, and in the intervals of the labor of opening and equipping, have managed to do 150 days of actual washing for gold, although a very great deal even of that time we have been washing the least remunerative top gravel, but in those 150 days we have taken out $63,000 of gold dust, and 150 days is just one normal season.

Towards the end of this season, when we were at last running with our new monitors and our 1,000 inches of water, we were taking out an average of $475 per diem, and just as the mine had to be closed down for the year struck a rich patch which makes us anxious for the commencement of next season. In the words of the managing director, "a thorough clean-up was made in the boxes and cut in No. 2 pit; the bed rock in the cut was picked, and all gold that could possibly be collected, saved. The water supplied by the new ditches had been turned off for the winter, and we only had the small amount brought down by Berry Creek with which to finish the cleaning up in the lower pits.

"To avoid letting any of this water run to waste, we ran again in No. 2 pit for ten hours with a poor head. On walking through the cut after this run I noticed a good showing of gold on the bed rock. Snow fell during the night, and the next day the water was turned off for good, the machinery was dismantled and the year's work was over.

On weighing the gold from the last clean-up, we found that one roasting of amaglam was just a quarter of an ounce short of 500 ounces, and I volunteered to get a quarter of an ounce out of No. 2 cut. I went up with our foreman, but found the snow so deep in the cut that I could not pick up the gold I had seen over night. A stream of muddy water was trickling down out of the pit, and to get any gold at all, we had to lift this water in V-shaped troughs and then scrape the gravel into a pan and save it by hand-washing. In this manner we took out of one small hole, towards the head of the cut, twelve pans of gravel, which yielded $130 in coarse dust and small nuggets

"When it is remembered that it takes sixty pans of dirt to make a cubic yard, these figures are phenomenal, and while I am far from wishing to raise any exaggerated hopes that may not be fulfilled, the results obtained establish without doubt the fact that we are at present mining extremely rich ground."

With adequate knowledge of hydraulic mining, a rare asset nowadays, and ample money for development and working expenses, we might no doubt have done much better.

Had we prospected the pockets of the public and handsomely advertised our property we might have done better still, but as an example of what may be taken out of the gravel itself by hard work and such persistent energy as has been displayed, for intsance, by our managing director (who is also our head piper), Mr. Warburton Pike, this is perhaps not bad.

Besides the Berry Creek Company there are two other hydraulicking companies in Cassiar, but these are still in their initial stages, and when the day comes for dealing with lode mines, *i.e.*, when Cassiar has some transportation facilities, it will be found that the pioneers of the country have their stakes upon some rock which would not be sneered at in any mining camp.

It will be observed that in this article no allusion has been made to the Atlin country, which is, of course, a portion of Cassiar. This is a wilful omission. Atlin is sufficiently well known to the public and is rapidly making itself a good reputation. It has the start in the race. It will do well, if it leads or is in sight of the Stickine country at the finish. Good luck to both of them.

WESTERN COAL RESOURCES

By J. C. Gwillim
School of Mining, Kingston

Prior to 1902 he country west of Fort William was supplied with coal from the following sources:—

Winnipeg, and Manitoba generally, from the Eastern Staes, by way of the Great Lakes to Fort William, and

thence by rail to Winnipeg and the Manitoba towns. Besides this, some of the Souris-Estevan lignite was used for local steam and fuel purposes. The Souris field lies about 280 miles southwest of Winnipeg.

Up to this time practically no coal came into Manitoba from the Alberta or British Columbia mines, partly because the costs were against it. Probably Alberta coal can be laid down at a slightly lower price than Eastern coal in Winnipeg, but the quality is hardly as good as the best Eastern coal. In 1904 farmers in Western Manitoba paid $17 per ton for Eastern hard coal. Semi-anthracite from Bankhead, in Alberta, could now be sold at these points for under $12.

In the Territories the sources of supply were the Canmore and Anthracite mines of Bow Valley, on the main line of the Canadian Pacific Railway, and the Lethbridge and Frank mines on the Crow's Nest Pass Railway.

None of these were heavy producers, their total daily output being under 1,000 tons. The demand for domestic fuel was light and was supplied from Anthracite and Lethbridge. The former mine shipped a semi-anthracite coal as far as the San Francisco market, while Lethbridge lignite found favor as a stove coal in the Territories and in Southern British Columbia.

For the British Columbia interior and some of the Western States the Crow's Nest collieries supplied a good steam bituminous coal, and a superior coke for smelting purposes.

On the coast, Vancouver Island collieries, at Nanaimo, Wellington and Comox, supplied the coast trade and shipped largely to San Francisco.

Up to this time the collieries were easily supplying a very inadequate demand.

Since the year 1902 there has been a rapid increase of settlement and of values throughout the Western country. The demands for steam transportation, domestic fuel and smelter coke have all increased greatly. This increase has caused the opening up of several new collieries in Alberta, chief of which are Taber, Bankhead, West Canadian Collieries, and the International Coal & Coke Company, all of these, except Bankhead, being upon the Crow's Nest Pass line.

None of this coal west of Red River is of the carboniferous period, such as furnishes Eastern America and much of Europe. All the Western coal is cretaceous or later; but owing to conditions of heat and pressure which accompanied the formation of the mountains, it is quite largely bituminous and in a few places semi-anthracite. Wherever the coal is later than the cretaceous period, or is far removed from the mountains, it is a lignite of more or less value, according to the amount of alteration since its deposition. Age, alone, does not determine its quality.

Passing westwards from Winnipeg, the different fields may be summarized as follows:—

Sourise-Estevan Field.—Two hundred and eighty miles southwest of Winnipeg, in rocks later than the cretaceous and similar to those of the Edmonton field, 800 miles west of Winnipeg.

This coal, a lignite at a short depth below the general prairie level, is of only moderate value for fuel and locomotive work. On exposure it crumbles badly, but owing to its position it may hold the local trade against the long haul of Eastern and Western coals. If it can be commercially briquetted it may find a large market.

Taber and Lethbridge Fields.—Seven hundred miles west of Winnipeg. These are cretaceous lignites of good quality, firm and blocky; this coal burns well in stoves, and is used for locomotives during certain seasons. At Lethbridge this coal lies about 200 feet below the prairie level and is mined on only one four to six foot seam, which dips gently westwards.

West of these fields and overlying them is a later formation, which also carries lignite seams. These occur in a strip which runs from the United States boundary up to and past Edmonton. At the latter place they furnish a fair quality of domestic and steam coal for local purposes.

The Mountain Coal Fields.—These seams and strata have been thrown up from their deep-seated position in the lower cretaceous by the eastward thrust of the Mountain ranges. This movement by folding and faulting the coal measures along a N. N. West line within and in front of the first mountain ranges, has caused a number of repetitions of the same coal measures.

It is this repetition and the ease of access by tunneling that make the Alberta bituminous coal a favorable source of supply for the great needs of our own Prairie Provinces and the States to the southeastwards which lack good coal.

This belt of lower cretaceous coals tapers off to a few narrow basins within the mountains as one goes northwards to Yellow Head Pass. It has been traced for about 300 miles in a N. N. West direction from the United States boundary; beyond that point there is an absence of these measures for a space, but this reappears on Pine and Peace River, 300 miles further on in the same direction.

Wherever the folding has been most intense this coal is apt to be badly crushed, but its grade passes from bituminous coking coal upwards through semi-bituminous steam coal to a semi-anthracite, such as that found at Bankhead, near Banff, the head of the south fork of Sheep Creek, and, it is said, some areas in the Crow's Nest field.

Crow's Nest Feld and its extensions up the Elk and Fording Rivers 40 to 70 miles north of Michel are fields of great magnitude in area and total thickness of seams. This coal is especially fitted for the coke so necessary in the smelting operations of the mountain mineral districts.

There is no coal field, in quantity and quality, on the Pacific slope which is likely to rival this region. The States of Idaho, Washington, Oregon and California have little coal of this quality, and it may supply many of the Western smelters as well as some of the Pacific steam service besides the main part of the interior mountain traffic.

Some grades of it furnish fair domestic fuel; north of these Elk River fields the bituminous coal does not appear on the Pacific slope of the first mountain ranges, but is confined to a few narrow strips along the Alberta or Eastern slopes and inter-mountain.

The Interior British Columbia Fields.—These are confined to smaller areas of lignite and low bituminous coal, of which Nicola coal field is the best example in quality. They are of a period later than the cretaceous, are more irregular, and, unless affected by later igneous intrusions, are apt to be lignites of no great value for coking or steam coal. However, they will furnish local transportation and fuel purposes on account of their position from Crow's Nest or Vancouver Island.

Pacific Coast Coals.—These are cretaceous coals of fair steam quality. They occur on Vancouver Island, Queen Charlotte Islands and on the mainland within the drainage basin of the Skeena River. The Vancouver Island coals are mined at Nanaimo, Wellington, Union

and Comox. On the eastern shore they occur as a narrow strip outcropping along the shore and dip gently beneath sea water to the east. The coal here has been estimated to be of great amount, but much of this ground will not furnish the tonnage expected of it. The seams are not numerous nor of great thickness. They also have unworkable areas, but, being as they are on tide water, and having no greater competitors upon the North Pacific coast, will be made to yield to a large market. North of Vancouver Island there are some uncertain areas of bituminous and anthracite coal on Queen Charlotte Islands, which have not yet been extensively worked.

To the east of Queen Charlotte Sound, and within the influence of the Pacific terminus of the Grand Trunk Pacific, there are some areas of bituminous and anthracite coal. These have been prospected and located within late years, more especially within the drainage of Telkwa Siver, in anticipation of the trade of the new Pacific terminus and its railway. They were the subject of an investigation by Mr. W. W. Leach, of the Canadian Geological Survey last summer, and an account of them may be found in the Annual Summary Report for 1906. Between these Pacific fields and Peace River or Yellow Head Pass there is unlikely to be good steam coal; and again between these and Fort William there is little chance of bituminous coal.

Thus the Great Lakes; the first or eastern foothills and ranges of the mountains, and the Pacific coast will be the chief coal distributing points of the future for Western Canada.

To those who are interested in the Western coal resources, there is a fund of information in the reports of the Canadian Geological Survey, especially those made by the late Dr. G. M. Dawson, D. B. Dowling, Jas. McEvoy and W. W. Leach.

THE INTERNATIONAL COAL AND COKE COMPANY, LIMITED

DENISON COLLIERY, COLEMAN, ALBERTA

Among the newer mines being opened up in Alberta is that of The International Coal & Coke Company, Limited, at Coleman, on the Crow's Nest branch of the Canadian Pacific Railway. Although Coleman is only a little over three years old, and the mine has been on a shipping basis for about two years, both have made that progress and development which characterize Western enterprise.

The plant has a capacity of 2,000 tons daily, and is handling at the present time 1,500 tons. No expense has been spared by the company in making the equipment thoroughly up-to-date in every particular, and it may be safely said that the International has one of the most modern plants in the West.

BEE HIVE COKE OVENS—INTERNATIONAL COAL & COKE CO., COLEMAN, ALBERTA

The measures occur in the cretaceous or laramie cretaceous coal-bearing rocks, and are part of the great Crow's Nest field, but, separated from the Crow's Nest Pass field proper by the main range of the Rockies, the height of land coming about eight miles west of Coleman. Two seams are being worked from the drainage level, No. 2 for steam coal, and No. 4 for coke. The dip is very regular in both seams, at from 30 degrees to 32 degrees, and the system of mining used is room and pillar, the sooms being run straight up the pitch, with a sheet iron chute in the centre.

In No. 2, cross-cuts every 60 feet, and rooms 50-foot centres and 10 feet wide, make the pillars 60 feet by 40 feet; a barrier pillar double this size divides a panel of 10 pillars from the next 10; and every tenth room is run to the surface as an air shaft, thus providing the

required split in the air, also a means of lowering timber into the mine as the work advances.

No. 2 is a 14-foot seam, with good roof and bottom, and the pitch is sufficient on the sheet iron chute to carry the coal to the gangway by gravity.

The haulage, which has been found to work very satisfactorily, is by compressed air locomotives, three of which are used, two 5 inch x 10 inch cylinders to collect the trips in the mine, and one 6 inch by 10 inch cylinder to haul the loads to the tipple.

No. 4, or the coking seam, is 6 feet thick, and worked on the same system as No. 2, except that the rooms are 60-foot centres and 15 feet wide, making the pillars 60 feet by 45 feet.

All mining is done by hand, and while the mine cannot be said to be gaseous, safeties are used in all the working faces.

An 11 foot by 6 foot Cappell fan, running at 200 revolutions per minute, and supplying 130,000 cubic feet of air per minute at 1.4 water gauge, is used with excellent results.

All power used in and around the mine is generated at a central station, which is equiped with four 100 horse-power Erie City return tubular boilers, and two 150 horse-power Jenkes return tubular boilers, all at a pressure of 110 pounds.

,Two 400 horse-power Phœnix engines, direct connected with two 250 kiliwat 250 volt direct current Westinghouse dynamos, supply electrical power for the fan, machine shop, tipple, and lorries, and also for the town and mine electric light systems. ,

The compressor for the air haulage system is a 4-stage Canadian Rand machine, high pressure duplex 16-inch by 24-inch steam cylinders, with Myers' riding cut-off valves. The air is delivered at 1,000 pounds pressure to the various charging stations on the surface and in the mine.

The power plant is all under one roof and most modern and efficient in all details.

The Cappell fan mentioned previously has a capacity of 150,000 cubic feet per minute, driven by a 150 horse-power Westinghouse motor, and can be used either as an exhaust or a blower by the manipulation of a system of doors in the fan house.

,The machine shop equipment is electrically driven, and consists of one 30-inch American Tool Company's patent engine lathe, one 24-inch drill press, one 16-inch by 24-inch shaping machine, one bolt threading machine, one 24-inch swing saw, one 18-inch combination table saw, sheet steel shears, rollers and punch.

The blacksmith forges and carpenter shop are under the same roof as the machine shop, making a most convenient arrangement. , ,

The coal is hoisted from the yard level to the tipple floor on two automatic self-dumping cages, working in balance.

No. 2 coal passes over a bar screen to a link belt picking table, and from there to the storage bins directly under the end of the picking table.

The No. 4, or coking coal, passes from the tipple floor into a 9-foot Bradford breaker and reduced to half inch and smaller before going to the slack bins.

An Ottumwa Box Car Loader handles the coal from the storage bins, which have a capacity of 2,000 tons for lump, and 1,000 tons for slack.

The slack from the Bradford Breaker is conveyed by two electric lorries (of 6 tons capacity each, and equipped with 35 horse-power Westinghouse motors) to the coke ovens, of which there are at present 176, of the beehive type, 12 feet by 7 feet 5 inches, with a capacity on hour coke of 300 tons per day.

The product of the mine is used to a large extent by Western railroads, both in Canada and the States, the supply falling considerably short of the demand.

The coking plant is also taxed by the ever-increasing demand from British Columbia smelters, and the coal mining industry generally, while yet in its infancy as compared with the Eastern fields, bids fair to rival Pennsylvania and Nova Scotia in a very few years.

RECENT DEVELOPMENTS IN METALLURGY

By S. F. Kirkpatrick

Professor of Metallurgy, School of Mining, Kingston

In the following paper I do not intend to give an exhaustive resume of the various improvements in the art or science of metallurgy, but rather to show by a few examples what great advances have been and are being made in that direction.

The statistics of the production of the principal metals in the last few decades is instructive, showing that in the last forty years, from 1865 to 1905, the yearly output of gold has increased threefold. In the same time the annual production of silver has increased 4.7 times, the production of copper 7.7 times, the production of lead 5 times, the production of zinc 6.2 times, the production of pig iron 6 times, and two new metals which were not formerly produced on the commercial scale are sold to-day in large quantities, namely, nickel and aluminium. So the consumption of metals generally in 1905 was approximately six times as great as in 1865, and it might be well to note that the yearly increase was never so great as it is at present.

Now, how is it that the supply has been able to keep up with this ever-increasing demand of the manufacturing and commercial world?

Firstly, no doubt, by the opening up of the mineral wealth of new countries and the increased transportation facilities which puts formerly inaccessible ore deposits within reach of a market and also in many cases by the settlement of new districts bringing the market to the ores.

Besides this, however, there is another important force; in the increased engineering and metallurgical skill brought to bear on the mining and treatment of the ores, so decreasing the cost of recovering the metals that lower grade and more refractory ores can be treated at a profit. The metallurgical treatment of the various ores is sometimes the development of years or centuries; and so-called standard methods of treatment have been devised. But there is always a gradual improvement in the details of the manipulation, the result of the combined energies of all the metallurgists in charge, so that in the course of time from a crude evolves an efficient process. This change is slow but steady, for engineers are generally conservative, and if a process or machine works satisfactorily they will not discard it for an untried device, even if that device gives promise of very considerable advantages.

So it does not follow, because a particular process or furnace is the standard type, that it is the best device that could be employed. Possibly if another process or type of furnace had been first introduced it would have succeeded better. Sometimes we find the same class of ore treated by entirely different methods in different countries, and it may be some time before one of the processes is developed to such a point that it can show itself so superior to the other as to replace it.

Besides this gradual advancement there is occasionally a radical change made in the method of treatment. This may be due to the work of some one man who will conceive an idea and work out and prove his views until, with the help of a commercial plant, he will convince the most conservative metallurgist of the value of the process.

In many cases, however, this radical change of method will be forced by some external cause, such as a change in the grade or character of the ore treated, or a decrease in the market value of the metal produced, so making the standard method formerly employed no longer profitable. Then it is that the metallurgists compete to overcome the difficulty and nowhere could the old adage, "Necessity is the Mother of Invention," be more true; for a new method is nearly always found. For the metallurgists are only woking on the threhold of a science, the possibilities and limitations of which it is hard to state.

Take the case of smelting of iron ores for making pig iron crude cast iron. The first blast furnaces were introduced in Germany and England about the 14th century. The same general process is used to-day; but the early smelters would have considered half a ton a good day's output with a consumption of two to four tons of charcoal per ton of iron, while last year one of the large Pittsburg furnaces made 900 tons of pig in 24 hours, probably using only three-quarters of a ton of coke per ton of iron.

This great change can not be attributed to any one time or man, but rather to the gradual evolution marked by some few decided advances, such as the introduction of coke in place of charcoal in the seventeenth century, the introduction of the hot blast in 1828 by Neilson, and later the construction of the furnace with a closed top, so saving the waste gases that contain a large percentage of carbon monoxide; and this inflammable gas is used to heat the blast and supply all necessary power used around the plant.

The development in the smelting of copper ores in the last few years is quite marked. Twenty-five years ago small furnaces of brick were used that would treat from 30 to 100 tons of copper ore per day; and it was considered that an ore should assay from six to eight per cent. copper to be a good financial proposition.

These small furnaces worked slowly and somewhat erratically, requiring constant repairs and were very subject to the worst disease of a furnace, namely, a freeze-up.

Before the scientific days of copper smelting, when many of the furnaces were in the hands of the so-called practical metallurgist, who had rather a contempt for chemistry, this was considered unavoidable and the following story was much appreciated by the copper fraternity. A boastful metallurgist when visiting a large copper smelter remarked to the foreman in charge that he had never had one of his furnaces freeze up. The foreman looked at him for a minute or two and then remarked: "Well, friend, you are either a blank liar or you hain't had much experience."

The modern furnace, although subject to accidents, is a much more perfect machine. It is usually in charge of a technical metallurgist and can be counted on for continual operation, treating from 400 to 1,200 tons of ore per day.

This improvement has been gradual, but, as in the case of the smelting of iron, occasional great strides have been made, as in the replacing of the brick furnace by one constructed of iron water jackets, the introduction

of mechanical charging devices and in general the replacing of hand labor.

Another item of importance is the decreased use of fuel, such as coke.

In the old process for treating an ore high in sulphur (30-45 per cent. sulphur), it would be first roasted to remove a large percentage of this element, then smelted in a blast furnace with fluxes and from 12 to 20 per cent. of coke to form a copper matte containing 30 to 40 per cent. copper with iron and sulphur. This matte would then be roasted to remove more sulphur, and again smelted and possibly after on more roast copper could be obtained in a reverbatory furnace with a consumption of from 20 to 40 per cent. of fuel.

Now such an ore is treated in a blast furnace directly with little or no coke, and the heat required for melting the charge is produced by the burning of the sulphur and the oxiding of the iron, so making a 30 to 50 per cent. copper matte in the first fusion. This copper matte, while still hot, is tapped and run into a barrel-shaped vessel called a converter. Air is forced up through the molten matte and the remaining sulphur is burnt to sulphur dioxide, which passes off as a gas. The iron is oxidized, then slagged with silica, leaving the copper fairly pure. The heat generated during this reaction is sufficient to keep the copper perfectly molten, so that it can be poured into moulds.

By this method sulphur has been converted from an enemy into a friend.

The general reduction in the cost of melting allows of ores being treated to-day that formerly would have been of no value.

In some few cases the metallurgical treatment of certain ores has remained nearly stationary for years or centuries, to be suddenly disturbed by the introduction of some new revolutionary method.

Mexico, the old silver camp of the world, is now undergoing such a change.

When that country was first opened up by the Spaniards in 1557, the Patio amalgamation process was introduced for working the silver ores, and this or analogous amalgamation methods have been operated almost continuously ever since, many of the individual mines having produced from $100,000,000 to $500,000,000 worth of silver.

About three years ago successful attempts were made on a commercial scale to introduce the cyanide process, in which the silver is dissolved out from the ores by a dilute solution of potassium cyanide and then precipitated from this solution by zinc or deposited by a current of electricity.

Now cyanide plants are being erected as energetically as possible in many parts of that country, and we may confidently expect that in the future the cyanide process will be responsible for a large percentage of the world's silver. On account of the decreasing cost of treating ores it is possible to treat grade ores not formerly mined. This was by no means the first time that the cyanide process was employed, for the process was devised about 1886 for the treatment of gold ores, being particularly adapted to low grade ores.

A large percentage of the world's gold was and is obtained from its ore by the process of amalgamation. In but few cases does the stamp battery extract all the values, and a long-felt want was supplied when it was found that most of the gold left in the tailings or waste from the gold mill could be extracted by means of cyanide.

From the time the process was first used it has been steadily developed, till now there are few stamp mills without a cyanide plant, and it is claimed by some authorities that directly or indirectly the cyanide process is responsible for over 50 per cent. of the world's gold.

Now, turning again to the statistics of the production of the metals in the last forty years, the question arises, What about the future? Will the available ore deposits be sufficient to suply the demand?

Much speculation has been indulged in and much has been written on this subject, particularly as regards the future of iron and fuel coal.

No doubt the output of iron must continue to increase, but at what rate we are not able to foretell. If we were to assume that the percentage of increase would be the same for the next 200 years as for the past 40, we would get some astonishing figures; but such an estimate would be entirely wrong.

Some of the iron ore deposits of the world now being mined are very large, but it is doubtful if there is 100 years' supply in sight.

But, no doubt, particularly in the new countries, many new deposits will be found of equal richness, and, moreover, there are immense quantities of rock so low in iron as not to be classed as ore at present that will, without doubt, be successfully worked by metallurgists of the future. These low grade or bodies are even now being mined and made into high grade ore by magnetic concentration. It does not require very much foresight to say that the world need not go without iron and steel as long as there is rock containing 10 to 20 per cent. iron. Even at the present time it looks as if it would pay to treat many of the low grade iron deposits if they are favorably located. (In many cases we can mine an ore and concentrate it for less than $1 a ton, and so we could concentrate 15 per cent. iron ore up to 65 per cent. for about $5 per ton.) The value of iron ore at Lake Erie docks would be approximately this.

We are probably only at the beginning of the development of the world's copper fields. Particularly in the new countries. The United States is now the great producer, yielding 56.7 per cent. of the total yearly production in 1905, and will probably continue to be the most important source of supply for some years to come, particularly as active development is being undertaken in Alaska. Then Canada and Mexico and even South America are rapidly coming to the fore, and Asia and Africa have great possibilities as copper producers.

Copper, however, is not a widely distributed metal like iron, and even low grade deposits are not common.

In the last forty years there has been a greater increase in the consumption of copper than of any of the common metals.

An interesting estimate of the future production of copper based on the rate of increase in the past is given in Stevens' Copper Hand Book.

The average yearly increase during the nineteenth century was slightly over 4 per cent., and for the last decade nearly 8 per cent. At 4 per cent annual increase the production of copper in 1950 will be 3,700,000 tons, and in the year 2000 28,000,000 tons; or at 8 per cent. yearly increase the production for 1950 will be 19,900,000 tons, or, in the year 2000, 811,800,000.

These last figures are of course on entirely hypothetical data, for if the latter figures were correct nearly all the able-bodied men in the world at present would be required to produce copper. But on the most conserva-

tive estimate, the demand for copper or some metal that can take the place of copper as an electric conductor, will grow and it is an interesting speculation as to where this supply will come from.

This question was discussed a number of years ago, and many writers enthusiastically declared that the new white metal, aluminium, then being put on the market for the first time, was the metal of the future, and the solution of the difficulty. This idea has had a considerable setback, for, although aluminium has been on the market for a number of years, selling at a little over thirty cents per pound, nothing revolutionary has happened and several producing aluminium works got into financial difficulty. However, the consumption of aluminium has gradually increased, and the metal is becoming better understood. Possibly now with the high-selling price of copper the uses of aluminium may be developed.

As regards the other base metals, the same fear might be expressed of an ultimate shortage, as in the case of copper, but to a less extent. Possibly in the far future aluminium may replace even these metals for many of their uses.

As for the precious metals, silver and gold, I will not attempt to foretell the future demand, but leave it for the economist, banker, statesman, etc., to determine what percentage of these metals are necessary. I might hazard the opinion that gold with all its attractions is not an essential good or evil.

IRON MINING IN NORTHERN ONTARIO

By A. B. Willmott

Sault Ste. Marie, Ont.

During 1906 the exploration for iron ore throughout Northern Ontario has progressed with vigor, and some discoveries of importance are reported to have been made. The known iron ranges of Ontario now surpass in numbers the various ranges on the south shore of Lake Superior, but beyond the rough outlining of the ranges comparatively little exploratory work has been done. The tendency has been to locate the iron ranges, comply with the Government regulations, and then to hold the lands for sale, or as possible sources of future or supplies. Speculative holders have done the former, whereas large iron consumers have done the latter. In very few cases have actual ore bodies been proved by exploratory work. Undoubtedly were our iron ranges located south of the international boundary line a vastly larger amount of diamond drilling, test pitting and other exploratory work would have been done, with a view to finding ore bodies. Our newspapers and public men are accustomed to speak of the large iron deposits in Ontario, when as a matter of fact there has been up to 1906 but one shipping mine worthy of note. It is true that the surface indications and geological conditions lead us to infer that iron ore may be found in quantity in Ontario, but with a few exceptions this supposition has yet

BLAST FURNACES AND UNLOADING DOCKS, ALGOMA STEEL CO., SAULT STE. MARIE

to be proved. The following notes give a brief description of the more important work of the past year.

The Atikokan Iron Company have connected their mine with the Canadian Northern Railway, and will be ready to ship ore in the spring of this year, and by that time the furnace which is being built for them at Port Arthur is expected to be completed. The ore is a high grade magnetite, low in phosphorus but high in sulphur, so that the ore must be roasted. The company are installing their own coke ovens for the manufacture of the coke required, and will use the by-product gases for roasting the ore. The completion of this furnace should open a market for a considerable quantity of the low grade ores in the Port Arthur district which are not rich enough in iron to stand the expense of long shipment.

HELEN MINE

During the year a discovery has been made of hematie ore, about ten miles northeast of Port Arthur. The ore lies near the surface, and it is expected can be mined by steam shovel. The Dominion Mines & Metals, Limited, has been formed with a capital of $1,000,000 to operate this and other properties, and they are pushing their development work actively. A railroad of several miles will have to be built to connect with the Canadian Pacific Railway, and the ore will be shipped over the Canadian Northern Railway docks at Port Arthur. The company hope to begin shipments during the season of 1907.

The Loon Lake properties, owned by Messrs. Marks and Wiley, Hogan, Flaherty and Knobel, are under option to a company of American capitalists. A considerable part of the purchase price has been paid, and the purchasers claim to have several million tons of hematite ore in sight. There is little doubt but that the purchase will be completed. With the property goes a railway charter for a road from the mines to Thunder Bay, between four and five miles distant. Ore docks are to be built there, and will afford cheap transportation. Compared with other ranges round Superior this rail haul is very short, and should offset the extra cost of mining which is likely to occur. The ore is of good grade, but lies flat, and is bedded with lean portions which will have to be picked out.

Nothing has been done during the year with the iron ores lying east of Lake Nipigon, in the vicinity of Poplar Lodge. Dr. Coleman, of the Bureau of Mines, has made a careful study of these ranges, and his report should shortly appear. The right-of-way of the Nipigon Railway from Lake Superior to Lake Nipigon is now being cut out, and it is expected that construction will shortly start. The completion of this road will make possible the shipment of ore from these Nipigon ranges, and should encourage active development. Sixty miles to the northeast of Poplar Lodge other iron-bearing lands have been taken up by the United States Steel Corporation and others, but no development work has been done.

In the Michipicoten country some claims have been taken up near Pucaswa, showing rather lean magnetite on the surface.

Nothing has been done on the Iron Lake or Frances Mine properties during the year. At the Josephine Mine operations by the Algoma Commercial Company, Limited, were stopped because of a dispute regarding the title to part of the property.

Operations at the Helen Mine were seriously hampered by a fire which in the early summer destroyed the crusher building and machine shop. New buildings were erected, much more convenient than the old ones, and the latter part of the season the output was increased to normal proportions. The toal shipments for the year 1906 were 121,555 long tons, making the total shipments from the mine to date about 1,200,000 tons. This is by far the largest amount of iron shipped from any iron mine so far exploited in Ontario. It is expected the shipments for 1907 will be considerably larger than for 1906. The ore shipments for 1906 have been marketed in the United States and at Hamilton and Sault Ste. Marie, Ontario.

Some prospecting was done along the Algoma Central Railway north of the Soo, but nothing of consequence was found. The Williams and Breitung properties are at present closed.

At Moose Mountain, forty miles north of Sudbury, considerably surface work was done during the year, the land being cleared and camps erected. The Canadian Northern Railway was graded from Sudbury to the property. This winter ore docks are to be erected at Key Inlet on the Georgian Bay. The management fully expect to be shipping ore sometime during the summer. A very considerable body of magnetite of high grade is exposed on the surface of a hill, and the mining will be open quarry work for some time.

At Temagami some exploratory work was carried on by the Temagami Iron Mining Company during the past summer. This company have two and a quarter miles of banded jasper and iron ore, and are searching for the concentrations which are likely to occur at points along the range. The surface of the property was carefully examined by trenches and test pits, and a little diamond drilling done. The work is to be continued this year.

In Boston township, on the Temiskaming & Northern Ontario Railway, a somewhat similar deposit is being explored; diamond drills are at work this winter testing the property.

In Eastern Ontario some small trial shipments of ore were made from the Farnum property in Hastings county. The ore is a high grade magnetite of bessemer grade. A branch of the Central Ontario Sailway was built into the property during last fall, and the management expect to ship 100,000 tons during the coming summer.

The consumption of iron ore in Ontario is rapidly increasing. Last year there was in the neighborhood of 280,000 tons of pig iron produced, which represents over 500,000 tons of iron ore. Of this only a small part was furnished from Ontario mines, the remainder being imported from the United Sates. As the revised bounties adopted by the Dominion Government are now more favorable to Canadian ores, we may look for an increase in the shipments from Canadian mines. Unfortunately there are almost no companies in Ontario attempting to supply iron ore. There are a great many firms and syndicates willing to sell reputed iron properties for large sums, but almost none have faith enough in their properties to develop them and sell iron ore. It is to be hoped that the new bounties will stimulate owners of iron lands to become ore producers.

DIMITRI IVANOWITCH MENDELEEF

By W. Hodgson Ellis

Few men have left a deeper impress upon the scientific thought of our time than the great Russian chemist, the news of whose death has just reached us. His name will rank among the chemists of the latter part of the nineteenth century, as that of Dalton did among those who flourished at its beginning.

Distinguished no less as a patient and accurate investigator, than as a profound philosophical thinker, and while his brilliant speculations have illuminated the whole field of chemistry, and have proved a lantern to lighten the feet of a host of explorers in the paths of pure science, he was equally strenuous and equally successful in the endeavor to turn the searchlight of science on the problems of daily life and aid in developing his country's resources.

Siberia is hardly the place to which the eyes of the world would look to await the coming of a prophet of science, nevertheless it was there that the discoverer of the periodic law was born, just seventy-three years ago. His father was director of the gymnasium (high school) of Tobolsk. His mother, like so many of the mothers of great men, was a remarkably capable and energetic woman. While Dimitri, who was the youngest of her seventeen children, was still an infant, her husband became blind, and the care of the family devolved upon her. This task she fulfilled in an admirable manner. She established a glass works, to the management of which she brought so much ability and industry that it became a successful concern, and she was able to keep her charges in comfort and give them a good education. Her youngest son, after passing through the gymnasium at Tobolsk, was sent to the University of St. Petersburg to study chemistry, with a view to assisting in the management of the works. For some reason, however, he University, and, after finishing his studies there, he bechanged to the Pedagogical Institute, connected with the came a teacher in a gymnasium in the Crimea. On the breaking out of the Crimean War he removed to Odessa, and shortly afterwards became Privat Docent in the University of St. Petersburg. Here he began a series of researches on specific volumes, and showed such promise that the Russian Government sent him to Heidelberg, where he pursued his studies for two years. In 1863 he was made Professor of Chemistry at the Technological Institute of St. Petersburg, and in 1866 he obtained a similar chair in the University.

His researches on specific volumes, begun in 1855, were continued during fifteen years. Since 1870 much of his work has been devoted to the elasticity of gases.

It is, however, as the enunciator and elucidator of the periodic law that the name of Mendeleef is most widely known. In 1869 he read a paper before the Russian Chemical Society, in which he showed that "the properties of the elements are a periodic function of their atomic weights." In this and subsequent papers he elaborated this idea and arranged the elements in the order of their atomic weights, showing how they fall into groups in the manner now so familiar to us as "Mendeleef's table."

Mendeleef was not the first to arrange the elements in such an order, nor the first to point out the periodicity of their properties. Newlands, in England, and De Chancourtois, in France, had done this several years before. But no one before had worked out the problem so thoroughly, so logically, and so successfully. Even then

chemists were by no means eager to accept the idea. But when, in 1875, Lecog de Boisbandrau discovered gallium and described its properties, Mendeleef pointed out that he had predicted in 1871 that a gap in his table corresponded to an undiscovered metal which he called eka-aluminium, and to which he had ascribed properties which exactly corresponded to those of the new metal. Subsequently two other predictions, ekaboron and eka-silicon, were fulfilled by Scandium and Germanium. The scientific world was taken by storm.

The new law was accepted by acclamation, and ever since it has been of the utmost service in suggesting lines of investigation and pointing out the probable road to truth. It is interesting to note how all the principle nations of Europe assisted in the establishment of this law. The law was first announced in England; the atomic weights upon which it is based are those of an Italian, Canzzaro; it was developed and formulated in Russia; and France, Scandinavia and Germany each contributed a new element to prove the correctness of its predictions.

But Mendeleef did not confine the energies of his powerful mind to speculations, or even to investigations, in pure science. He was at all times ready to place his talents at the service of his country.

It was largely due to his efforts that the monoply which had paralyzed the oil industry of Baku was removed. The enormous development of the industry which followed this step is familiar to everyone. He was sent by the Government to the Caucasus and to Pennsylvania to report on the wells and refineries in those localities, and his reports were of the greatest value to the scientific and industrial world. He made a study of the specific gravity of mixtures of alcohol and water for revenue purposes, which was a model of careful and accurate work. Indeed, through his life he was employed by the Russian Government in researches of various branches of industrial chemistry, and has been, since 1893, chief of the Bureau of Weights and Measures at St. Petersburg.

It is characteristic of him that, while engaged in useful investigations and thoroughly sympathizing in their object—the betterment of the condition of his countrymen—he never lost sight of their scientific side.

As a result of his work on the density of alcohol, he developed a theory of solutions; and his study of the oil deposits led to his well-known theory as to the origin of petroleum by the action of superheated steam on metallic carbides.

Mendeleef was no philosophical recluse. He held strong views on social and political questions, and was at all times ready and willing to assert them in the press or upon the platform. He was an enthusiastic protectionist, and strongly advocated a tariff framed so as to build up the industries of Russia.

He was a member of the Council of Commerce and Industries.

A plebiscite was recently taken in France as to who was the greatest Frenchman of the nineteenth century. It is a most gratifying evidence of that strong common sense which distinguishes the French people, that Napoleon came low on the list, while at the head of it, with a large majority, stood Pasteur. I do not know whom the people of Russia would name as the greatest Russian of the nineteenth century, but if genius of the very highest order devoted to the successful investigation of nature and a life consecrated to the service of his country constitute greatness, then Russia can claim no greater son than Dimitri Ivanowitch Mendeleef.

Speculation in Mining Stock—A Suggestion

To the Editors:—

Sirs,—As I am sure that you intend in your new *Mining Journal,* which I am glad to welcome, to discountenance all wild speculation in mining stock, such as we witness to-day in the Cobalt mining district, will you kindly give me a little space for a few remarks on this subject?

A very rich mining district has been found at Cobalt, but it will not be of permanent benefit to our Province if from day to day and from week to week the manufacture of millions of dollars of paper money continues to be sanctioned and authorized by our Provincial Government under the form of "stock certificates" of the numerous new Cobalt mining companies daily incorporated and chartered by the Provincial Government. There seems to be no stop to it. Every new week brings its fresh millions, and the Department of the Secretary of State is overworked and has been for months granting out new charters, permitting such terrible onslaughts on the savings of the public.

Will no one stop this disgraceful and most dangerous gambling? The Government becoming somewhat alarmed has given a warning in the Speech from the Throne at the recent opening of the Legislature, but it seems to me, Mr. Editor, that in such a crisis we want more than an academic warning, even though it comes from the throne. It seems to me that we should have an effective remedy and a prompt one. Surely we have a right to expect this from the Government, which justly prides itself in having stopped the Toronto Junction and Fort Erie poolrooms shortly and quickly after it came into power. To stop this one form of gambling and, on the other hand, to continue to sanction and authorize another form of gambling much more insidious and in which larger sums are at stake, is an anomaly which the Government should not tolerate. As it is at present, the Government not only tolerates this gambling, but in fact creates it by the granting of their own charters to any new company for any capitalization named and without any restriction whatsoever.

But now is the opportunity for the Government to at once check this, as the Hon. Mr. Hanna has just introduced a new Companies' Act, which I notice was read the second time yesterday, and the details of which were referred to a committee. Let this new Act provide that before a charter is granted it will be proven to the satisfaction of the Secretary of State that ten, fifteen or twenty per cent. of the total capital stock petitioned for has been paid into the treasury of the company and stands there *bona fide* for the purposes of the company, and at once it will become impossible to have in any new district three or four hundred million dollars of capitalization on, mostly, wild schemes. A similar provision is to be found in the Dominion Companies' Act, and it seems to me is a simple, sure and safe remedy for the Government to adopt to protect the public, and I earnestly hope that this provision will become a part of the new law.

Yours very truly,

Eugene Coste.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA

Cariboo.

The heavy snowfall this winter assures an abundant water supply for gold placer mining in Cariboo district the ensuing season, and, consequently, the recovery of gold should be larger than during the two seasons past. It may not be expected to show any considerable increase, though, until after the Cariboo Gold Mining Company (the Guggenheim organiation that early last year acquired the property of the Consolidated Cariboo Hydraulic Mining Company, which had for years been operating at Bullion Quesney mining division under the managment of John B. Hobson) shall have largely increased its water supply and thus provided for a full season's gravel washing each year. The work of bringing in more water is not likely to be sufficiently advanced to admit of this company recovering much gold in 1907. Several hydraulic mines in the Cariboo division of this large district should, however, yield more gold than during recent years, for much of their dead-work has been completed and their water supply increased. The two chief deep drift mining companies, the Cariboo Consolidated, Limited, operating at La Fontaine on Lightning Creek, and Slough, Creek, Limited, on Slough Creek, should this year add to the production of gold from this district. The former last season during two or three late summer and fall months recovered sufficient gold to pay operating expenses, and the outlook is that the great flow of water from the ancient river channel tapped will be still further kept down and more rich gravel be taken out and washed. At Slough Creek additional steam power, a large winding engine and two 500 gallon skips will supplement the work of the big pumps, so that here, too, the water should be disposed of to an extent that should admit of the mining of gold-bearing gravel with resultant good returns.

East Kootenay.

The St. Eugene lead-silver mine at Moyie, owned by the Consolidated Mining & Smelting Company of Canada, continues productive and still possesses large reserves of ore. Its output of shipping products during the calendar year 1906 consisted of about 3,500 tons of crude ore and 25,000 tons of lead concentrates. The mine is stated to now be in a better condition than at any previous time in its history, recent underground work having disclosed the occurrence in the lower levels of the mine of big chutes of ore, the existence of which was not known before.

The Sullivan mine is maintaining its average weekly production of 500 to 600 tons of lead ore, which is reduced at the company's smelter at Marysville, a few miles from the mine. The North Star and Stemwinder, near Kimberly, are both being worked. On the latter has been discovered a big body of ore, which is reported to need concentration before shipment to the smelter.

Deep snow and severe cold have made the hauling of coal and coke from the Crow's Nest Pass Coal Company's colleries difficult, so that production is not as large at present as when transportation conditions are favorable. Notwithstanding this the Coal Creek mines made a record output on January 29th, with a tonnage of 2,600 tons. When the weather shall again be mild and sufficient railway cars be available, the production of this company's mines will no doubt soon reach a larger monthly total than in any previous year. The demand for Crow's Nest Pass coal and coke is active, and, given adequate transportation facilities, will continue to steadily grow.

Cassiar.

At Atlin, too, prospects are good for an increased yield of gold next season, for on two or three of the richer creeks the claims of the individual miners have been bought out by companies which will operate on a much larger scale and with power appliances that will handle considerably more gravel than has been washed in past seasons.

The Atlin Consolidated Mining Company, stated to be a Guggenheim enterprise, during the forty-one days it was able to wash gravel on Pine Creek after the installation of its seventy-five-tone steam shovel and system of electrically operated dump cars last season, found this method of working profitable; so it is understood to intend to put in two more steam shovels.

The two Ruffner Companies—Pine Creek Power and North Columbia—have made provision for an abundant supply of water for their operatons on Pine Creek. It is estimated they will have a supply of 5,000 inches per day during the whole of the washing season.

The Amalgamated McKee Creek Mining Company purposes installing a steam shovel. This and another company, Hamshaw Bros., of New York, are largely interested in, are stated to have been working economically and making good profits. The French company, known as the Societe Miniere, operating on Boulder Creek, is also reported to have done well and to have excellent prospects for the coming season.

In Northern Cassiar the Berry Creek Mining Company has about completed its deadwork and the management expects that the coming season's returns will well repay the company for its outlay during the several years it has been doing preparatory work—bringing in water, installing hydraulic equipment, erecting buildings, etc. After completing its water supply system last season gold to the value of $21,750 was recovered during 109 24-hour days' gravel washing. As much top dirt had to be hydraulicked before pay gravel could be washed, this result is regarded as much below what will be achieved this year with the pits in shape for work under more favorable conditions. From one pit an average of $475 per diem was obtained last season during a run of twenty days.

West Kootenay.

Ainsworth mining division has a number of lode mines at work. In the old Ainsworth camp the west side of Kootenay Lake, the sale last fall of the Krao mine to Butte, Montana, mining men, directed much attention to the camp, interest in which has been revived by the discovery late in the summer of rich silver ore in the Krao. A number of properties that had long been idle are now being worked, and prospects are good for a busy year and an enlarged production of ore.

Across the lake the Blue Bell is being developed and has big showings of ore, which the Canadian Metal Company, owning this mine, purposes concentrating before shipping to the smelter. The erection of the concentrating mill will probably be undertaken shortly, the manager of the company, S. S. Fowler, having already prepared plans and had levels run for bringing in water. The development of the Argenta, situated on Hamill Creek, at which a power plant was installed last autumn, is being proceeded with. Several mines on the south fork of Kaslo Creek are showing up well under

development. The Cork mine and concentrator have been proving satisfactory to their French owners. The Province and Montezuma will have their own concentrator in operation later this year. Both the Whitewater and Whitewater Deep, in Whitewater camp, are being operated under lease. A big tonnage of ore and concentrates is accumulating at the Kootenay Ore Company's sampling works at Kaslo, awaiting orders for shipment to the smelters.

In the Slocan work is being continued on mines in the McGuigan, Sandon, Cody, Three Forks and Slocan Lake sections of this extensive district. At the Rambler-Cariboo the raise to connect the deep-level tunnel driven at 1,450 feet depth with the bottom of the 800-foot shaft, is approaching completion. It is reported that ore of good grade has been met with in this raise and that the prospects for the mine are promising. Among the mines around Sandon that are being worked are the Payne, Last Chance, American Boy, Ruth and Richmond-Eureka. In the vicinity of Slocan Lake, the Standard, Vancouver Group and Hewitt are most prominent, while about Slocan City the Ottawa and Arlington, among others, are being further developed.

About Nelson the La Plata mine and mill on Kokanee Creek are being operated. During the first five weeks of the year about 2,200 tons of ore were milled, and between 400 and 500 tons of product shipped to the smelter. The Eureka, a copper property, is being steadily developed, and several gold properties in the vicinity of Nelson are also at work.

Financial arrangements have been made in London to provide for a resumption of work at Ymir gold mine. Some high grade silver ore has been encountered in the Hunter V. mine, which has arranged to maintain regular shipments of its lime-silver ore to two or three district smelters. The Second Relief, Queen, and Arlington, in the Salmo-Erie section of Ymir district, are all making satisfactory progress.

Rossland mines are developing most satisfactorily. The Consolidated Mining & Smelting Company of Canada has extended its holdings here, these now including the Centre Star, War Eagle, Iron Mask. Enterprise and Idaho. The first named two are being explored at considerable depth, their main shafts being the deepest in the Province. The tonnage of ore available for mining is stated now to be larger than at any previous time since these mines were opened. The big working shaft of the Le Roi is being deepened; it is now down about 1,600 feet. Le Roi No. 2 is keeping up its shipments of first-class ore to the Trail smelter, and is milling lower grade ore at its own concentrator. Its production during five weeks of this year was about 2,200 tons. The Consolidated Company's mines produced about 6,000 tons and the Le Roi 12,000 tons during the same period. The White Bear is developing an ore chute on its 800-foot level; this gives promise of proving sufficiently productive to shortly admit of a fair tonnage being shipped regularly.

Boundary.

Between a shortage of fuel and the unusual severity of the winter, the big copper mines of the Boundary district have been operated under much difficulty. This will be evident when it is pointed out that the output of the Granby Company's mines during January was less than 1,000 tons per day, while notwithstanding the interruption caused by the coal miners' strike last autumn, their daily average production for the whole of 1906 was about 2,200 tons. There is not likely to be much improvement until the difficulties mentioned shall have been removed.

Beside the Granby mines, those of the British Columbia Copper Company and the Dominion Copper Company have been working as best they could under conditions far from favorable. All three companies have kept their respective smelting works in operation, but necessarily below their full capacity. It is hoped, though, that mines and smelters will be again operating on their customary scale before the close of February.

In the Similkameen, weather conditions have also been against the working of the Nickel Plate mine and the forty-stamp mill at Hedley. It is probable that here, too, conditions will not long remain unfavorable.

Coast.

Official figures of production of ore at the Britannia mine, owned by the Howe Sound Copper Company, which last year acquired the mining property of the Britannia Copper Syndicate and the smelting works of the Britannia Smelting Company, show that 108,396 tons of copper-gold ore were mined in 1906. Of this quantity 65,844 tons were milled at the company's concentrating works at Britannia Beach, Howe Sound, producing 12,612 tons of concentrates, which, together with 35,726 tons of crude ore, were shipped to the Britannia smelter at Crofton, Vancouver Island, and 6,826 tons of ore went to other smelters. The tonnage smelted at Crofton during the year was as follows: Britannia ore, 20,546 tons, and concentrates. 11,393 tons; Mt. Andrew (southeast Alaska) ore, 3,445 tons; custom ores, furnace products, foreign matte, etc, 19,208 tons; total, 54,592 tons. The production of metals was: Copper, 4,409,560 lbs.; silver, 38,265 ounces; gold, 5,261 ounces. Improvements recently made at the smelter are expected to add considerably to the treatment capacity of the works.

The Tyee Copper Company has deepened the main shaft of its Tyee mine at Mt. Sicker to 1,250 feet, and sinking is still in progress, the intention being to reach the 1,450 foot level in the spring. Low grade ore has been met with on the 1,000, 1,150 and 1,250 foot levels. Concentration tests are being made, the company planning to concentrate the large tonnage of low grade ore developed in the mine. The shaft on the company's X. L. claim, adjoining the Tyee, has been sunk to 550 feet, and further sinking is to be undertaken here. The quantity of ore treated in 1906 at the Tyee smelter at Ladysmith, Vancouver Island was: Tyee ore, 23,823 tons; custom ores, about 5,500 tons. The metals produced were: Copper, 2,115,617 pounds; silver, 77,085 ounces; gold, 3,776 ounces. The total value of these products, after deduction of cost of refining and purchase of custom ores, was $396,500.

The Wellington Colliery Company during 1906 mined 790,018 tons of coal in the following proportions: Comox (Cumberland) mines, 408,901 tons; Wellington (extension) mines, 381,117 tons. Coke made during the year at the company's ovens at Union totaled 13,058 tons; total sales in 1906, including coke taken from stock, were between 17,000 and 18,000 tons. The Western Fuel Company's mines produced 373,700 tons of coal, 290,000 tons of which came from No. 1 shaft, Esplanade and Protection Island Mines, Nanaimo, and 83,700 tons from No. 4 mine, Northfield. The gross output of the coal mines of Vancouver Island was thus 1,163,817 tons.

So active was the demand for locally-made Portland cement during 1906 that the Vancouver Portland Cement Company enlarged its works at Tod Inlet, near

Victoria, Vancouver Island, by one-half, bringing the capacity up to 900 barrels per diem. A further enlargement having been found necessary, more buildings, power plant, grinding machinery and another kiln are being added to the works. Practically all the Portland cement used in the Province last year was manufactured at Tod Inlet, where the company already has storage room for 75,000 barrels and ample shipping facilities for all the cement it will be able to manufacture, even with much enlorged works.

ALGOMA, ONTARIO

Active work is now in progress on the Campbell mine, near Bruce Mines. This property, which was leased from the Copper Mining & Smelting Company of Ontario, Limited, in August last, is owned by Messrs. John McKane, of Tonopah, Nev., "Lucky" Scott, of Pioche, Nev., and Dr. Campbell, of Rossland, B. C., and is considered to be one of the most promising in the district. The vein, which is sixteen and a half feet wide on surface, carried high grade copper ore in good paying quantities. A boiler and hoist have recently been installed and a shaft, now forty feet deep, is being sunk which, it is expected, will strike the vein at a depth of 100 feet. A company is now in process of formation for the purpose of taking over and working the property.

Mr. E. Sjostedt, of the Superior Power & Rolling Mills Corporation, Sault Ste. Marie, visited the Bruce Mines, now being worked by the Copper Mining & Smelting Company of Ontario, Limited, on February 14th. He visited the company's plant and the 400-ton concentrating mill, which he considered they were exceedingly fortunate in finding already built for them on the property when it was taken over from the former owners, The Bruce Mines, Limited, and expressed his surprise at the improvements and additions which had been made on the property since his last visit some seven years ago. Mr. Sjostedt is on a tour of inspection of the various copper properties in Algoma with a view to obtaining information as to the probable amount of ore available for the proposed new smelter at Sault Ste. Marie, Ont.

The Jury Mines, Limited, have recently offered 25,000 shares of their capital to the public at 10c each. Their property is situated a few miles from Dean Lake, and a promising showing of good grade chalcopyritic copper ore is reported. A shaft has already been sunk to a depth of forty-six feet, and another has now been commenced. A shipment of ore has been made to the Blue Island Smelter at Chicago.

Mr. T. Hayes-Sheen, general manager of the Copper Mining & Smelting Company of Ontario, Limited, has left for London, England, to attend the annual general meeting of the company.

COBALT

Cobalt, Feb. 22. 1907.

Coniagas.—Work is being rapidly pushed forward on the Coniagas.

A twelve drill air compressor has been installed and the foundations are being laid for a hundred ton concentrating plant, containing Hancock jigs, Frue Vanners and Wilfley tables; also a Huntington mill. They are also putting up a large sampling plant. This plant is being installed by the Allis-Chalmers-Bullock Company of Montreal, and when completed will be one of the finest in the country.

A new vein of smaltite and native silver has been found on the Victoria Silver Cobalt Mines property. This important discovery was made within six feet of the contact between the diabase and conglomerate. The vein did not show on the surface, and was opened as a test to see if the contact did or did not mean anything. It is now twelve inches wide.

The great confidence that is placed in the future of the camp and the amount of development work already taking place is shown by the large orders of machinery that have been placed. The Rand-Jenckes have installed over 25 plants. The more important are, at the Coniagas, a 12 drill duplex steam compound air compressor and 100 horse-power boiler; at the Colonial, a 12 drill compressor and three 100 horse-power boilers; at the King Edward, a 12 drill compressor and two 100 horse-power boilers (this plant will be ready in about ten days and promises to be one of the finest yet erected); at the Buffalo Mine, a second half of a complete duplex steam compressor; at the Provincial, first half of a six drill duplex steam compressor and an 80 horse-power boiler, also large hoisting engine; Kerr Lake Mining Company, Nancy-Helen, Townsite and Victoria Mines are also having large plants installed by the same company.

The Allis-Chalmers-Bullock people of Montreal are also very busy installing machinery in the camp. Among the more recent installations are the Green-Meehan ten drill compound air compressor and two 100 horse-power boilers; the Right-of-way, ten drill compressor, a large double drum hoist and one 100 horse-power boiler, also a lighting plant; the Temiskaming Mining Company, five drill compressor and large hoisting engines and a direct-connected lighting plant; the Cleveland Cobalt, three large belt-driven air compressors; the McKinley-Darragh a ten drill compressor and two 100 horse-power boilers and lighting plant. This company are also erecting a five stamp mill.

The Portage Bay district is at present attracting a great deal of attention from mining men of Cobalt, and they feel confident that future development will show this to be a district of great richness. Already the present working mines are showing up large veins of ore and gold in quantity is also found on a great many properties. It is expected that during the spring and summer development many more finds will bring this place into importance.

A great many prospectors are already going into the Montreal River district and Temagami Reserve, where the late rich finds have called attention to the widening of the mineral belt, and this part of the camp will share honors in the spring with Larder Lake.

Cobalt Lake Mining Company.—Cobalt Lake is seven-eighths of a mile long and comprises fifty-two acres. It is surrounded by the Nipissing, O'Brien, La Rose, Right-of-way, Trethewey, Coniagas, Buffalo, Silver Queen and McKinley-Darragh mines. It lies at the centre of the geological disturbance and among the greatest producing mines. The Cobalt Lake Mining Company paid the Government one million and eighty thousand dollars for the right to mine underenath the waters of the lake and a strip 33 feet wide on the east shore. Operations, mainly of a prospecting nature, have been carried on for about two months. The largest and richest vein discovered is No. 4, which angles across the 33-foot strip and enters the lake. It is very rich in visible native silver. A development shaft is being sunk and has attained a

depth of about fifteen feet. One hundred and fifty feet to the south, vein No. 5 is being developed by a shaft now down 20 feet. The values, small at the top, constantly increased with depth, until native silver was struck at a depth of about 18 feet. Two hundred and fifty feet north of No. 4 a vein of solid niccolite a foot wide was recently discovered. This is now being prospected. Besides these, there are many veins which enter the lake along the eastern shore, being devlopd by shafts and ttst pits. Fully a third of the shore line yet remains to be stripped.

A group of Toronto capitalists are organizing a company for the purpose of building and operating a plant for concentrating local ores. The concentrator is designed to profitably treat all ores carrying over $110 per ton, and will have a capacity of about 100 tons per day.

For the week ending February 16 the Trethewey mine shipped three cars of ore, aggregating nearly ninety tons. These are the first shipments from that mine for 1907.

The Kerr Lake Crown Reserve Mining Company, which bought its property from the Government for $178,000 and a 10 per cent. royalty, are working a diamond drill on the lake.

The Nova Scotia mine has shiped a car of cobalt ore to Swansea. The mine has shipped silver ore before, but not cobalt.

Prospectors are daily setting out for Larder Lake. Many also are going up the Montreal River.

The buildings in Montreal Cobalt are nearly completed, and the machinery is on the ground. The plant should very shortly be in running order.

The Canadian Mining Journal wishes to thank Mr. H. P. Davis for a very complete and accurate blue-print of the Cobalt district.

PORT ARTHUR DISTRICT

Silver Mountain Mines.—Notwithstanding reports industriously reported to the contrary, (in the East), Mr. Hanson's force of miners are not operating in the silicious or "churty" formation peculiar to the lower hozizons of the argilaceous black slate formation. On the contrary—and as proven conclusively by their rich strike of high grade smelting and milling ore made in their workings on the 14th inst., the prospect for a continuous run of shipping ore of excellent quality—never, even the palmiest days of the "Shuniat Weishu," looked better. As a result of the very pronounced results from recent development at the West End Mine, unusual activity is being displayed in investigating several outlying mines and prospects in this vicity, and, as a matter of fact, a few of those old prospects have changed hands, and other mining organizations, as the "Amalgamated Silver Mining Company," as formed to operate them at an early date. The conditions for economical mining are now much improved, compared with the early nineties—when no roads, either wagon or rail, existed—while the demand for the white metal is also improving.

Gold.—Near the famous Aticokan iron mine, on Sabawa Lake—on the Rosa Blande—some very satisfactory exploratory and experimental mill work was lately conducted—some eighteen tons of ore yielding from off the plate $540 in gold. The No. 1 shaft is down 50 feet.

Aticokan Mine.—Two miles east of the Rosa Blande, on the north bank of the Aticokan River, are located the substantial and commodious camp buildings, stores and mining plant, of the Aticokan Iron Company, and immediately north, in the elevated ridge, running parallel with river and camp, and rising to an elevation of 150 feet above the water, are the practically inexhaustable magnetic iron ore deposits of this company. A spur line of three miles has just been completed from the main line of the Canadian Northern Railway to the mine, where everything is in readiness for regular shipments to their blast furnaces at Port Arthur—now nearing completion.

The Tip Top Copper Mine.—This property is situated within nine miles of Kashabowie station, on the Canadian Northern Railway. It is owned chiefly in Port Arthur. Capt. Dick Candoe, with a force of miners, has been steadily at work here for several seaosns, and as they mine is splendidly equipped with compressor plant, etc., it was no surprise to find many thousand tons of ore in their stock piles. The Tip Top vein is nowhere under 60 feet in width, while in the lower workings its width continues to expand. In addition to its high percentages of copper, the Tip Top is also distinguished as carrying considerable gold. Arrangements are in progress for the erection of a smelter for the reduction of htis ore, either at the mine—on the shores of Round Lake—or at Port Arthur, the head of navigation on Lake Superior, and the question of transportation, etc., in this connection is just now occupying the attention of the owners and the management of the Canadian Northern Railway.

Native Copper.—Some three or four, apparently, rich lodes carrying nuggets, shot and finely disseminated copper in the amygdaloidal trap formations, are about being opened up in Nipigon, Black and Cloud Bays, on the north shore of Lake Superior.

QUEBEC

Summary statement of mineral products:—

These figures are still subject to some corrections, but are practically correct in a general way.

Asbestos.—First-class crude 1,461 tons, value $325,530; second-class crude 2,456 tons, value $320,115; fibre 18,068 tons, value $783,722; paper stock 39,330 tons, value $676,556; total, 61,315 tons, value $2,105,923.

Mica.—Thumb trimmed 210,000 lbs., value $128,000; split 73,000 lbs., value $23,000; rough culled 116 tons, value $18,000.

Chrome Iron.—First crude 731 tons, value $9,542; second crude 4,005 tons, value $33,934; concentrate 4,047 tons, value $46,982; total 8,803 tons, value $90,458.

Iron.—18,331 tons of iron, worth $61,175, have been used in two blast furnaces, having produced 7,851 tons of pig iron, worth $177,643.

Copper Pyrite (Approximately).—40,000 tons, value $200,000.

Ocre.—2,785 tons, value $33,420.

Phosphate.—690 tons, value $4,100.

Felspar.—1,091 tons, value $3,818.

Graphite.—175 tons, value $8,300.

The total value of the mineral output, including the building materials, represent close to five millions and a quarter dollars.

NOVA SCOTIA NOTES

The shipments from the principal collieries for January do not in a majority of cases compare at all favorably with the shipments of the corresponding month of last year.

The Cumberland Railway & Coal Company's shipments were cut nearly in two, or a decrease of some 23,-

000 tons; the Dominion Coal Company's shipments fell off by some 25,000 tons, and the Intercolonial made a small loss of 500 tons. The two companies that made a favorable showing are the Acadia and the Inverness Railway Coal Company, the former making a gain of five and the latter of ten thousand tons. The falling off in the Cumberland Railway Coal Company's shipments is accounted for by the partial stoppage of work, owing to an outburst of damp, which had to be walled off. The Dominion Coal Company's loss is attributable to a lessened demand from the Steel Company.

There were complaints during the month of a shortage of cars. The complaint has become all but chronic.

The Dominion Coal Company will not be in a position to bank much coal this month, as 12,000 tons will be daily required to fill orders. The company intends shortly to open a mine, or perhaps two, on its extensive areas in what is known as the Lingan or Victoria district. It is known that three fine seams exist here. Some urge the company to give the famous, the now historic, Mullin's seam a trial. Others urge that the Victoria seam should be opened, as affording one of the best coals on the Island. Some of the officials have a leaning toward the Lingan seam, which produces a good gas and coking coal. The company was very much hindered in its operations last year through a scarcity of laborers, or, to be more exact, loaders. This year it will, if possible, try to overcome this obstacle. At present a representative is scouring Scotland, and another is off to Italy, in a quest for laborers.

Development work is still being forced at the Allan

On the ground that eighteen inches of the top coal in shafts of the Acadia Coal Company. It will be some time yet before these are large producers.

the seam is of only medium quality, the management of the Inverness Railway Coal Company gave instructions to leave the coal on. The miners claim that the lessened height lessens their pay, and made a demand for an increased rate. This the manager refused. Meantime the miners are working under protest, and will wait till the opening of navigation before pressing their claims.

The union men at Sydney No. 3, the largest colliery of the Nova Scotia Steel & Coal Company, stopped work the beginning of the second week of the month, in an effort to induce some 150 men not in the union to join their ranks. After a couple of days' stoppage they were successful, but the colliery remained idle the whole of the week, as the management were not prepared to start when the men had settled their differences.

The general imprssion is that wintry weather is of benefit to the coal trade. This may be if snow storms are not included. This last January was much more severe than the previous one, and yet the trade did not benefit.

COMPANY REPORTS AND NOTES

NOVA SCOTIA STEEL

At a meeting of directors of this company, held in Montreal on February 17th, the following report to be submitted to shareholders at the annual meeting thereof was duly approved:—

Your directors submit herewith their sixth annual report, with statement of assets and liabilities, and abstract of profit and loss account for the year ended December 31, 1906.

The total volume of business transacted by the company during the past year was considerably larger than that of any previous year, although, owing to the blast furnace at Sydney Mines being out for relining during the months of November and December, the output of pig iron was not very much greater than during the former year. The sales for the year increased $956,000 over the preceding year.

From our steel departemnt we shipped 42,831 tons of finished material, being an increase of practically 50 per cent. over 1905.

The quantity of pig iron sold, however, was very much smaller than the previous year, being 16,872 tons, as against 28,723 tons during 1906, due partly to the fact that a larger proportion of the output of the blast furnace was made into steel, and partly to the furnace being out of blast during November and December.

On December 31 we had orders on our books for 22,000 tons of steel at better prices than prevailed during 1906.

The quantity of coal mined exceeded that of the previous year by 126,172 tons, the company still being the second largest producer in Nova Scotia.

Early in the year we began the driving of submarine slopes for the purpose of reaching and opening up our sea areas in Wabana. Good progress has been made with this work, and the results obtained strengthen the belief of your directors that these submarine areas may prove to be a valuable asset of the company.

Your directors are pleased to report that the profits for the year 1906 were $960,281.03, as compared with $559,906.63 for the preceding year.

The amount to the credit of the profit and loss account on January 1, 1906, was $795,325.03, which, with the profits of the year, make a total of $1,755,606.06 to the credit of this account on December 31, 1906.

The regular dividend of 8 per cent. on the preferred shares has been paid quarterly.

The sum of $101,878.75 has been transferred to the credit of the special reserve fund—of which $75,000 is for general depreciation and renewals, $12,378.75 for blast furnace renewals, being 25 cents per ton on the output of pig iron during the year, and $14,500 for depreciation of the shipping property owned by the company.

During the year this reserve fund was charged with the sum of $29,215.28, being the amount expended in relining the blast furnace, and the further sum of $50,000 was charged against this account to provide against loss which the company may make in connection with its railway to Sunny Brae.

The amount to the credit of this fund is now $650,989.51, as compared with $628,326.04 at the beginning of the year.

The balance carried forward to the credit of profit and loss on the 1st of January, 1907, is $1,180,783.89, as against $795,325.03 on the 1st of January, 1906.

The sum expended on capital account in plant and improvements, in acquiring iron ore areas, submarine coal areas, and real estate at Montreal and elsewhere amounts to $199,256.10.

Your directors have aimed to place the company in a strong financial position before resuming payments of dividends on the common stock. They have also thought it desirable before resuming these dividends that there should be a reasonable certainty of their continuance under normal business conditions. While the profits for the past year, and the amount now at the credit of the profit and loss account seem to warrant the payment of

a dividend for the past year, the directors believe that the interests of the shareholders will be best served by passing it. They have declared a quarterly dividend of one and a half per cent. for the first three months of the year 1907, payable April 15th, to shareholders of record on March 31, 1907.

DOMINION COAL

The Dominion Copper Company's report for a period of 13 months to December 31, 1906, shows that 225,946 tons of ore were treated, from which 4,405,522 pounds of copper were produced, which netted the company $300,000, an average profit of about $28,000 per month. This production was obtained from the operation of the two furnaces which were in the plant at the time the present management took charge.

A despatch from Rossland says:—Two ore shoots of considerable magnitude and of good grade have been located on 800-foot level of White Bear. The management is much pleased over the finds, and feels confident that White Bear has the markings of a valuable mine. Coke is moving more freely, and considerable has been received at Le Roi smelter at Northport. It is expected that Le Roi smelter will resume operations about March 1. At Centre Star new converters and rock-breakers started up on trial run to-day, worked satisfactorily. The breaker has a capacity of 1,000 tons in ten hours, and will break rock at mine instead of doing it at the smelter as heretofore.

Shipments for the week were:—Centre Star, 1,410; Le Roi, 3,150; Le Roi No. 2, 510. Total for week, 5.070, and for year 35,377 tons. At Trail smelter, 4,136 tons received during week.

A considerable enquiry is reported to have sprung up recently for gold properties in the Rainy River district. A fine sample is reported to have been brought from the vicinity of Wabigoon running $20,000 to the ton in gold. In the past the gold ventures in the Rainy River district have not been successful, possibly owing to the expensive plants ordered by developers.

PIG IRON IN CANADA

The production of all kinds of pig iron in Canada in the calendar year 1906 amounted to 541,957 long tons; of which 525,716 tons were made with coke, 16,021 tons with charcoal, and 220 tons with electricity.

The iron made is classed as below:—

	1905.	1906.	Changes.
Foundry and forge...	146,698	130,120	D. 16,578
Bessemer pig	149,203	165,609	I. 16,406
Basic pig	172,102	246,228	I. 74,126
Total	468,003	541,957	I. 73,954

The total increase was 15.8 per cent. Canada has not made spiegeleisen or ferro-manganese since 1899.

On December 31, 1906, Canada had 15 completed blast furnaces, of which 8 were in blast and 7 were idle. Of the total 12 usually use coke for fuel and 3 use charcoal. In addition one furnace, to use coke, was being built and 3 coke furnaces were partly erected on December 31. Work on the partly erected furnaces was, however, suspended some time ago.

During the week ending February 9th, 1907, forty-one companies, twenty-one of which were mining companies were incorporated in Ontario. The total capitalization of the mining companies was $20,635,000; of the industrial companies, $2,755,000.

BOOK REVIEWS

The Cruise of the Neptune—a report on the Dominion Government Expedition to Hudson Bay and the Arctic Islands, on board the D. G. S. Neptune, 1903-1904, by A. P. Low, B.Sc., F.R.G.S., officer in charge. Ottawa—Government Printing Bureau, 1906.

In this substantial volume Mr. Lowe gives a direct, uncolored but vitally interesting account of the voyage of the D. G. S. Neptune.

Commissioned in the summer of 1903, the Neptune left Halifax on August 23rd of that year. After cruising along the shores of Baffin Island, through Hudson Straits and across Hudson Bay to Chesterfield Inlet, the winter was spent in Fullerton Harbor.

During the long winter, a season of confinement and loneliness, when everything depends upon keeping the officers and men cheerful and in normal health, Mr. Low encouraged all to supplement their routine duties by hunting and attending lines of fox-traps. "This proved," he writes, "much better than formal exercise at stated times and the general health remained good throughout thislong period of enforced idleness."

In the course of the succeeding summer's cruise formal possession was taken of Ellesmere Island, in the name of King Edward VII.

The account of the whole voyage is brief and entirely readable. It is followed by an historical summary of Arctic explorations from the voyage of Frobisher to that of Sverdrup.

Then follows an exceedingly graphic account of the manners, customs and moral characteristics of the Eskimos. This section is well worthy of careful perusal.

The geology of the countries touched upon is next developed. Mica mining is being carried on at Lake Harbone, on the north side of Hudson Strait. Referring to the Nastapoka iron deposits, Mr. Low says: "Most of these ores would require separation from the bands and lenses of jasper. The position of the ores on the islands separated from the mainland by a sound varying from a mile to four miles in width, with excellent, almost tideless, harbors, constitutes ideal conditions for shipment." He points out that advantage could be taken of the magnificent water power of Nastapoka River, "which falls 160 feet into the sea within a few miles of the best ore deposits. . ." No coal is found in Hudson Bay, so that economical smelting near the mines cannot be attempted, until electrical smelting becomes practicable.

The chapter on whaling makes stirring reading. That on navigation of Hudson Bay is of definite value. Mr. Low speaks with authority upon this subject. Let us quote him again. "The period of safe navigation for ordinary steamships through Hudson Strait and across Hudson Bay to the Port of Churchill, may be taken to extend from the 20th of July to the 1st of November. This period might be increased without much risk by a week in the beginning of the season and by perhaps two weeks at the close."

The "Cruise of the Neptune" is typographically attractive. The photographic illustrations are well chosen. Mr. Low writes crisply and breezily, and nowhere is the reader burdened with any attempt at decorative descriptions.

Altogether, for profit and pleasure, we heartily recommend the book to our readers.

MEN AND MATTERS

F. J. Pope, a graduate of the Kingston School of Mines, has gone to Chile to examine a mine for the Guggenheim interests.

J. L. Parker, at one time manager of the North Star Mine, East Kootenay, British Columbia, and for the last two years manager for the Brown-Alaska Company of New York, with mines at Hadley, Prince of Wales Island, southeast Alaska, and Portland Canal, British Columbia, has retired from the latter position and opened an office at Seattle, Washington, as a consulting mining engineer.

T. T. Fulton, B.Sc., lately of the laboratory staff of the Dominion Iron & Steel Company, Sydney, has been given charge of the laboratory of the Londonderry Iron & Mining Company. Mr. Fulton assumes his new duties on March 1st.

E. L. Fraleck, M.E., has accepted the position of superintendent of the Cobalt Lake Mining Company, Cobalt, Ont.

During the month of January, 1907, the continuous rod mill of the Dominion Iron & Steel Company, Sydney, N. S., rolled 7,966 gross tons of iron rods. This is the largest tonnage ever rolled in one month by a rod mill of the continuous type.

The equipment of mines in the Cobalt district is proceeding apace, and at nearly all the principal properties machinery is being installed. One manufacturing firm alone reports that since lats spring orders for fifty-six complete plants have been received and filled.

It is questionable whether any mining district in the world can show an achievement equal to Cobalt in the matter of early establishment of mines on a satisfactory dividend-paying basis. To all intents and purposes the camp is barely three years old, yet at least half a dozen mines are now paying handsome profits. Thus: Buffalo is paying dividends at the rate of 12 per cent.; Foster, 36 per cent.; Nipissing, 20 per cent.; Silver Queen, 32 per cent., and recently McKinley-Darragh, 24 per cent. In addition, there are many profit-earning mines owned by individuals and close corporations whose returns are large.

In the House of Commons the other day Dr. Thompson, member for the Yukon, called attention to the possibility of another international difficulty over the Alaskan boundary. The boundary country between the Yukon and Alaska was attracting gold seekers, and should rich strikes be made the uncertainty of the boundary line might cause complications. Dr. Thompson also stated that the boundary between the Yukon and British Columbia was unsettled, and asked the Premier, for a statement on both points. The Premier replied that he had no information at present regarding the British Columbia boundary. The Alaskan boundary had been delimited ten years ago by Mr. Ogilvie, of the Canadian service. The United States had refused to accept this survey, and now a further delimitation was in progress. A curious feature was that so far as the work had gone, it had been found that the Ogilvie line, which the United States refused, was 350 feet too favorable to the American Government. "However," said Sir Wilfrid, "they acted within their rights in refusing it and now another delimitation is in progress."

At a meeting of the Board of Directors of the British Columbia Copper Company, Mr. Colgate Hoyt was elected president, in succession to Mr. F. S. Underwood; Messrs. E. B. Lawrence and F. S. Sumner, vice-presidents, and Mr. R. H. Eggleston, secretary-treasurer of the company. Messrs. E. Hawley, C. A. Starbuck and B. B. Lawrence were elected members of the Executive Committee.

Large additions to the plant of the Ottawa Car Company, Ottawa, Ont., are contemplated. The company is branching out into the construction of steam railway rolling stock.

The Dominion Mining & Smelting Company announce that they are about to start operating their copper smelter at Picton, N. S. They advertise for copper ore.

Early in February J. R. Blackett resigned his position as auditor of the Dominion Coal Company, Glace Bay, N. S. Mr. Blackett had been with the Coal Company since its inception.

Legislative Visit to School of Mining

A notable event has been the visit of the Ontario Legislature to Kingston on Wednesday, February 6th, School of Mining and Agriculture. Some fifty memon the invitation of the Board of Governors of the bers, with Hon. Mr. Mathison, Provincial Treasurer; Hon. Mr. Cochrane, Minister of Lands and Mines; Hon. Mr. Monteith, Minister of Agriculture; Hon. Dr. Willoughby, Hon. Mr. Graham, leader of the Opposition, and Deputy Ministers Thos. W. Gibson and C. C. James, were carried to the old Limestone City by special train, arriving there at 2 p.m. They were received at the station by Hon. Wm. Harty, chairman of the Board; Principal Gordon of Queen's University; Dr. Goodwin, Director of the School of Mining, Mayor Mowat, and others. On the train piloting the visitor were Mr. D. M. McIntyre, vice-chairman of the Board, and Mr. G. Y. Chown, secretary-treasurer.

The visitors were taken in cabs to the Eastern Dairy School, which has done so much for the dairy industry of Eastern Ontario. Thence they were taken to the buildings of the School of Mining, where they were shown laboratories in operation in the various departments, including the mining laboratory, where were seen various products, including corundum, zinc ore—extracted by processes originated there. The long procession then passed through the buildings of Queen's University to Grant Hall, where luncheon was served. This fine audience chamber easily accommodated the 175 who sat down to table with Chancellor Fleming of Queen's University as chairman. At five o'clock the students marched in and filled the gallery. They took charge of the entertainment from that time on.

The toast list brought out speeches from Principal Gordon, the Ministers, and others, in the course of which it transpired that the members of the Legislature had a most friendly feeling towards Queen's University and the School of Mining. The governors of the latter are asking the Government for further aid to provide accommodation and instructors for the large numbers of students now coming in. The Ministers in their speeches referred to this and promised that the Government would give aid, but on the understanding that the friends of the School of Mining and of mining education should come to its help.

The excursionists returned to Toronto at 8 p.m., impressed with the valuable educational work being done in Kingston.

In the annual report of the Canadian Bank of Commerce special reference is made to the improvement in mining conditions in British Columbia, particularly as regards the copper industry. We quote the following excerpt: "The three great mining companies in the Boundary country, working low grade ores under peculiarly favorable conditions as to cost, are now settled factors in the prosperity of British Columbia, and must profit in an unusual degree by the present price of copper. They are making improvements in plant which should bring the smelting capacity up to 6,000 tons of ore daily. At Rossland, in various parts of the Kootenays and on Vancouver Island there has been unusual activity, and while the results in silver and lead mining are not yet what we had hoped, the prospects are better owing to the higher price of both silver and lead and the reduced cost of smelting. There have been important purchases of properties by expert capitalists, properties which have been idle are being worked, and a larger product on a sounder basis than at any time in the past is confidently expected."

Mr. A. D. Madden has been selected as the managing director of the Canadian Central Mines Company, Limited, Cobalt. Mr. Madden has been in Cobalt for over a year in connection with diamond drill operations. He has also had experience in a number of camps, and will take personal charge of the company's property.

A number of eminent geologists and engineers from the United States expect, we understand, to be in attendance at the annual meeting of the Canadian Mining Institute. These include President Van Hise, of Madison University, Prof. Leith, Prof. Kemp, Dr. W. Campbell, Mr. John Birkinbine, and Mr. John Hays Hammond.

COMPANY NOTES

British Columbia.

B. C. Copper.—Mr. F. S. Underwood, president of the British Columbia Copper Company, Limited, issued recently a circular announcing that the Board of Directors had recommended an increase in the authorized capital stock of the company by 200,000 shares of the par value of $5 each, making the total authorized capitad $3,000,000, and to offer at par 116,160 shares or $580,800 of said increase to the shareholders pro rata in proportion to their holdings. The new stock was authorized to stockholders of record of February 20 for subscription to an amount equal to 30 per cent. of their holdings at the rate of $5 per share, of which $2.50 per share is payable March 11th and $2.50 on May 10th next.

Ymir.—A circular has been issued to shareholders, informing them that arrangements have been made whereby the company's indebtedness will be discharged and additional working capital provided by an issue of debentures, of which the subscription of £40,000 has been guaranteed.

Ontario.

Nancy Helen Mines Company, Cobalt.—At the annual meeting of this company Messrs. W. R. Smyth, M.P.P., Wm. Black and J. F. Black were respectively re-elected president, vice-president and secretary-treasurer. The reports presented were of a most satisfactory nature. Some work has been done on the 40-acre claim in Bucke township, owned by the company. On the company's mine in the town site of Cobalt work has been and is being steadily continued. A shaft has been sunk 82 feet and three carloads of ore are now awaiting shipment. A plant and equipment is being installed. Several new veins have been discovered on this property quite recently, besides those now being worked.

CANADIAN MINING INSTITUTE

Incorporated by Act of Parliament, 1898.

AIMS AND OBJECTS.

(A) To promote the Arts and Sciences connected with the economical production of valuable minerals and metals, by means of meetings for the reading and discussion of technical papers, and the subsequent distribution of such information as may be gained through the medium of publications.

(B) The establishment of a central reference library and a headquarters for the purpose of this organization.

(C) To take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada.

(D) To encourage and promote these industries by all lawful and honourable means.

MEMBERSHIP.

MEMBERS shall be persons engaged in the direction and operation of mines and metallurgical works, mining engineers, geologists, metallurgists, or chemists, and such other persons as the Council may see fit to elect.

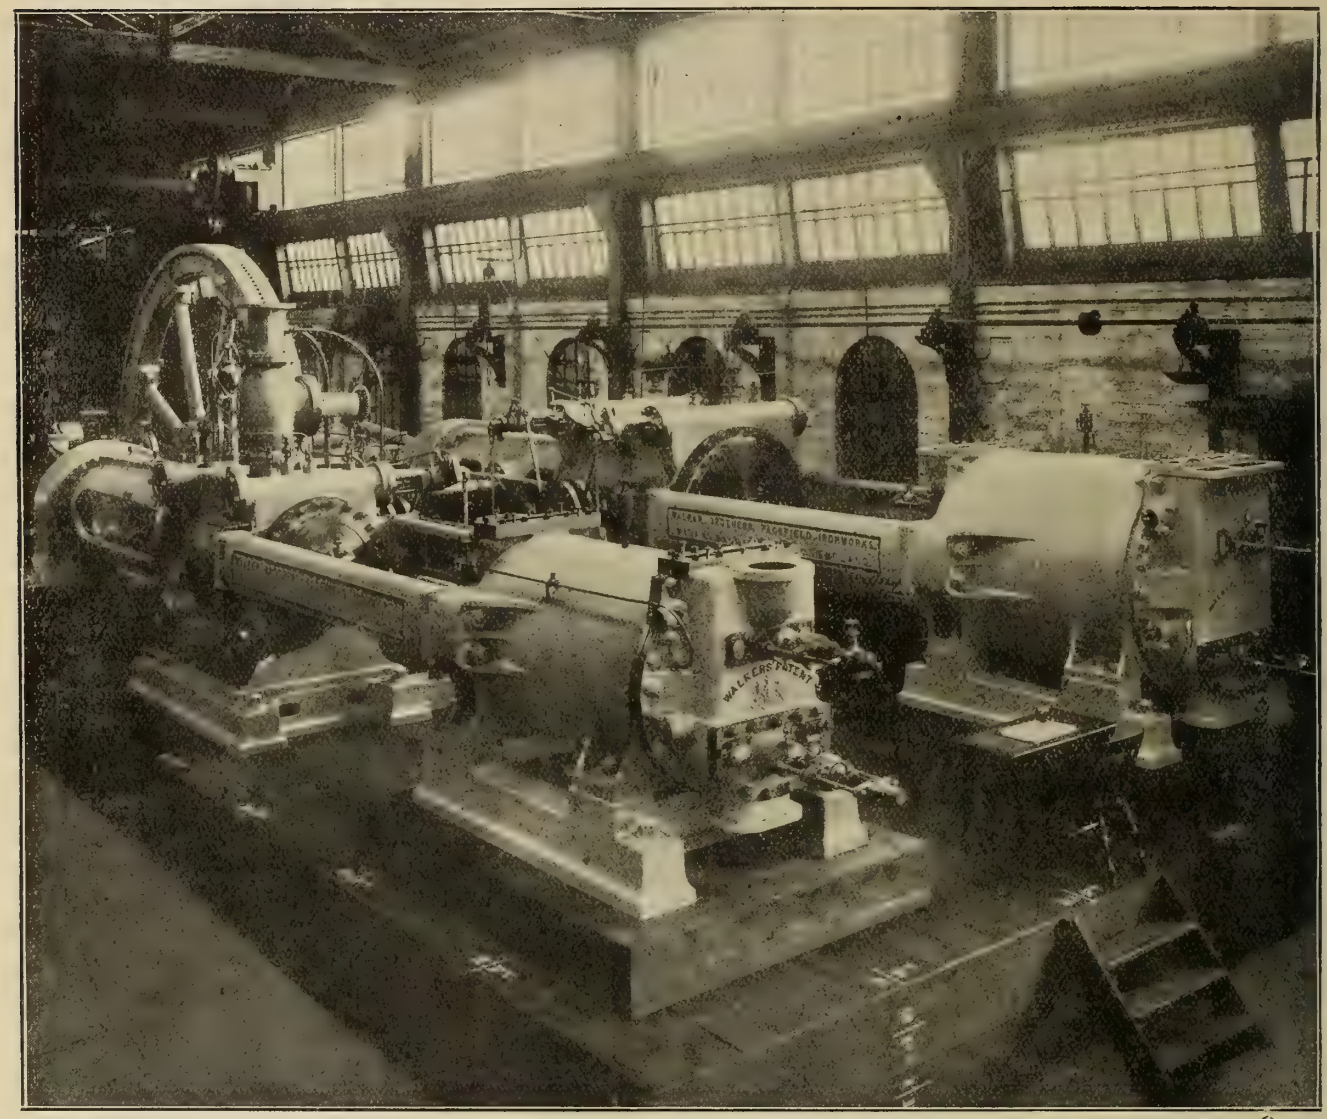
STUDENT MEMBERS shall include persons who are qualifying themselves for the profession of mining or metallurgical engineering, students in pure and applied science in any technical school in he Dominion, and such other persons, up to the age of 25 years, who shall be engaged as apprentices or assistants in mining, metallurgical or geological work, or who may desire to participate in the benefits of the meetings, library and publications of the Institute. Student members shall be eligible for election as Members after the age of 25 years.

SUBSCRIPTION.

Member's yearly subscription $10.00
Student Member's " 2.00

PUBLICATIONS.

Vol. I, 1898, 66 pp., out of print.
Vol. II, 1899, 285 pp., bound red cloth.
Vol. III, 1900, 270 pp., bound red cloth.
Vol. IV, 1901, 333 pp., bound.
Vol. V, 1902, 700 pp., bound.
Vol. VI, 1903, 520 pp., bound.
Vol. VII, 1904, 530 pp., bound.



Membership in the Canadian Mining Institute is open to everyone interested in promoting the profession and industry of mining without qualification or restriction.

Forms of application for membership, and copies of the Journal he Institute, etc., may be obtained upon application to

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Spring Catalogue will be ready for mailing by the first of March. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our Spring Catalogue for 1907 will be a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend.

Write for it now so as we can have your name on the list in time.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

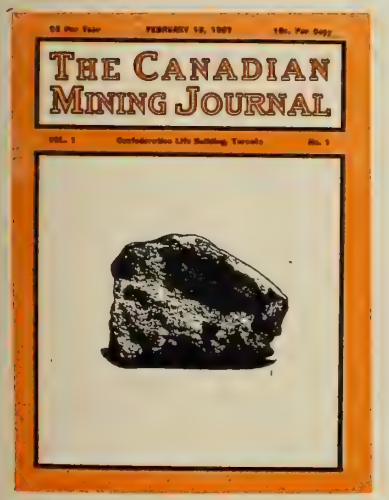
The Canadian Mining Journal

Makes its second bow to the mining men of Canada. "You will find it difficult to maintain the standard you have set for yourselves" was the general comment on our first number. The answer to that comment is before you. You find it satisfactory ?

You will find it still more interesting and satisfactory as we complete our organization and give you, from issue to issue, the authoritative news of the mining interests of Canada from Nova Scotia to British Columbia, without prejudice and without partiality.



We are pleased to be able to say that our campaign for circulation has been successful beyond our hopes. Everywhere our circulation canvassers have been received with cordiality and congratulated upon the excellence of our publication. The sales from the news stands have been 50% beyond our expectations, while subscriptions by mail are coming in from every quarter of Canada.

This is all very gratifying, but we are not satisfied, and will not be satisfied till every mining man in Canada is a paid-in-advance subscriber to the "Journal"

Have you sent in your subscription yet? If not kindly fill in the form below and return at once, so as not to miss any of the series. We still have a limited number of the first issue, to complete volumes where required.

If you are already a subscriber and are interested in the dissemination of mining information throughout Canada, will you not send us the names of any friends interested in mining and we will gladly forward sample copies?

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The Attention of Miners and Capitalists in the United States and in Europe is invited to the

Great Mineral Territory

Open for Investment in the Province of Quebec.

GOLD, SILVER, COPPER, IRON, ASBESTOS, MICA, PLUMBAGO, PHOSPHATE, CHROMIC IRON, GALENA, Etc.

ORNAMENTAL AND STRUCTURAL MATERIALS IN ABUNDANT VARIETY

The Mining Law gives absolute security to Title, and has been specially framed for the encouragement of Mining.

All mines belong to the government of the Province on all unsold lands and on all those sold since the 24th of July, 1880, but gold and silver are always reserved, whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such licenses the first right to purchase the mines. In the case of lands where the surface alone is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is $5.00 per 100 acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the government. The purchase price is as follows :

Mining for superior metals on lands situate more than 12 miles from a railway in operation, $5.00 per acre, and on lands situate less than 12 miles from such a railway, $10.00 per acre ;

Mining for inferior metals—the price and the area of the concessions are fixed by the Lieutenant-Governor in council.

The words "superior metals" include the ores of gold, silver, lead, copper, nickel, and also graphite, asbestos and phosphate of lime ; and the words "inferior metals" mean and include all the minerals and ores not included in the foregoing definition and which are of appreciable value.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions : The full price must be paid in cash ; specimens must be produced and accompanied by an affidavit ; a survey at the cost of the applicant must be made on unsurveyed lands ; work must be bona fide begun within the two years.

Mining licenses giving the right to work the mine and dispose of its products, are granted on payment of a fee of $5.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts. The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the New Grand Trunk Pacific Railway will run.

The government has made special arrangements with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines at Quebec, under the direction of the Superintendent of Mines, will give all the information asked for in connection with the mines of the Province of Quebec, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to :

McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science, and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

EDUCATION IN NOVA SCOTIA

We notice with decided pleasure the definite step which Nova Scotia has taken in appropriating a large sum of money for the purpose of establishing an Institute of Technology in Halifax. This institute, however, is to be but one part of the Local Government's plans. To quote from the Halifax Morning Chronicle:—

"The outstanding features of the scheme, which embraces the most complete system of technical education possessed by any Province of the Dominion, or any State of the American Union, are:—

"1.—The establishment of a central institution of university grade in the City of Halifax, to be called the 'Nova Scotia Institute of Technology,' for the purpose of affording instruction and professional training in metallurgical, civil, mining, mechanical, chemical and electrical engineering, and for the purpose of scientific research.

"2.—The establishment of subsidiary technical schools in industrial centres.

"3.—The continuation and enlargement of the Government mining schools, under the director of the Director of Technical Education.

"4.—The appointment of a Director of Technical Education, who will be Principal of the Nova Scotia Institute of Technology, and who will have supervision over the entire system of technical education."

The establishment of subsidiary technical schools appears to the JOURNAL to be a work of supererogation. Nova Scotia already has a good system of high schools and academies. In these students could be prepared for the central institute. Energy will be dissipated and misapplied in duplicating the work of the central institution. Far better were it to concentrate all expenditure and effort upon making the Institute of Technology a credit to the province.

For long Nova Scotia has felt the need of such a foundation. Her young men have been trained for the ministry, for law, and for commerce. She has supplied far more than her quota of eminent politicians and has produced not a few statesmen. Of mariners she has been prolific. Hardly a ship that crosses the Atlantic does not carry a Nova Scotian as captain or mate. But to prepare her sons to develop and conserve her vast mineral wealth she has hitherto done but little.

Dalhousie University, although handicapped by lack of funds and sadly restricted in the matter of accommodation, has, for the past few years, attempted to provide a mining and metallurgical course for a rapidly increasing number of students. Despite adverse conditions, very satisfactory work was done, and is being done.

The overcrowding of the Dalhousie School of Mining, and the plucky manner in which the college staff were attempting to meet the tremendous demands upon their energy, have doubtless been factors in awakening the Government to a proper sense of the country's need. But to the unremitting ardour of the president of the Nova Scotia Mining Society, and to the zeal and enter-

prise of the editor of a weekly paper, is due a large share of the credit in carrying the movement to a successful issue.

ON SAMPLING

It is an axiomatic truth that not one man in one hundred is capable of sampling an ore-body or stock-pile fairly and without prejudice. Although this truth is recognized, it is not acted upon in very many cases. A feeble assent will be accorded it. but sampling is even now largely left to inexperiencde youths. When sampling is done as a step in the mining or metallurgical processes of an operating company, there may be and there often is, gross laxness. When that company is selling a product of mine or smelter, another element is imported into the sampling. It is easily recognized then that loss may follow hard upon the heels of carelessness or ignorance, and errors are guarded against with elaborate pains.

To the lay mind, sampling signifies little beyond securing a "chunk" of ore, or other material, and having it analyzed. But we have seen men of light and learning in technical matters gravely submit a sample, a hand-picked specimen. As, almost invariably, higher results are obtained from the "specimen" than from the legitimate sample, it is obviously a hard task to combat this particular perversion. Even the painstaking labor of an experienced sampler is sometimes vitiated by his personal predilections or prejudices. Suppose that he is sampling a stock-pile, over which there has been a dispute, and that he is one of the disputants, it is harder for a camel to pass through the eye of a needle than for that man to dispossess his mind of all preconceptions. Not a few devices, some of them ingenious and some merely silly, have been suggested with the object of eliminating the personal equation. One expedient, the offspring of a vagarious brain, consists in tearing up a sheet of paper in small pieces and throwing a handfull of these pieces with the wind at intervals over the ground to be sampled. A piece of ore is then taken wherever paper has fallen. One trial of this method is sufficient.

But we wander from our overdue moral. The point which emerges from all this is to this effect, that to fairly qualify as an ore sampler a man must be honest first of all; and that, further, he must be intelligent and observant. Even then he may fail lamentably.

CONCERNING OTTAWA

It is announced from Ottawa that a Deputy Minister is to be appointed to assist the Hon. Mr. Templeman in administering his Department. The office is being created, and its creation will entail a sub-division of responsibility. The Deputy will have control of the Mines Section. The present Department of Mines, and a portion of the Geological Survey, will come under his jurisdiction. The need of such an office is not apparent. But, granting that there be such a need, the selection of a suitable Deputy should be a matter of most careful consideration. Never before has so much depended upon the proper and responsible exploration of our country. Interest in mining and in metallurgical process is at its flood. With the encouragement and with the intelligent assistance from an organized corps of Government geologists, and other specialists, we shall go on from strength to strength. Much, very much, depends upon that help. The efficiency of that help may be destroyed by hasty or ill-considered action on the part of the Government. To state the matter plainly, we strongly urge that, since such a position is to be created, the incumbent be a man, not only of recognized administrative ability, but also of attainment and eminence in the very work which he is to supervise. This is essential. The intrusion of politics in such an appointment as this—a contingency which we hope is indeed remote—would be a lasting blot on the Department's fair name, and a sure precursor of bickerings, strife and incompetency.

LARDER LAKE

At date of writing, more than 3,000 claims have been registered around and about Larder Lake. Company after company is being floated with capitalizations which make one dizzy.

At risk of falling into that obnoxious category of human beings designated "knockers," we wish to express our views. Pick up a prospectus of a Larder Lake company. Read it with care. In almost every case you will see the claim made that fabulously rich assay values have been found close to the property being exploited. In some rare cases these values, it is stated, have actually been found upon the areas of the company whose prospectus you are reading. But it is very generally true that the majority of Larder Lake properties are valuated on an entirely assumptive basis. The district is hardly yet in the initial stage of development. Not until late in April can systematic prospecting be undertaken. And yet thousands of dollars are being invested in possibilities! Improbabilities even are being capitalized at astounding figures!

We have not a word to say against Larder Lake as a legitimate and likely field for prospecting. Of its geological probabilities and limitations we are not now competent to speak. But no camp can survive the reckless and insanely unbusiness-like "boom" to which this place is now being subjected.

We wish to add one word in closing, and it is this. When statements of assay values are quoted in any prospectus, it is safer and saner to ignore them altogether unless signed affidavits describing the exact places, conditions and method of sampling, the name of the sampler, the name of the assayer, the size of sample and the circumstances under which it was shipped can be obtained. This is one very necessary and very much neglected preliminary step. You have, at this point, sufficient information to justify you in making further inquiry. Your next step is to engage a competent consulting mining engineer to go over the property in question and report upon the feasability of beginning mining operations. In brief, there is no reason under the sun why mining should not be approached in the same business-like attitude which is characteristic of the successful merchant.

THE PROSPECTOR AGAIN

Again we sing the Prospector. We, who of late bepraised and applauded him, do now desire to dilate upon his sinister aspects. A knock resounds upon our editorial door. A lean and cheerful individual enters. From his person emanates the fragrance of black rum and of the narcotic plug. From his pocket leaps the specimen, a lump of quartz besprent with gold—gold

glittering and obvious. He relates his tale. The specimen is but a fragment of a mountain of silica and free gold. He convinces us that in this admixture free gold predominates. Animated by a spirit totally contrary to the commercialism of to-day, he tells us that we may purchase a half interest for a paltry sum. We blushingly demur. We cannot rob him thus. He becomes vehement. We demur some more. At last, red and wrathful, emitting many unkind words, he leaves us.

CANADIAN MINING INSTITUTE

The Canadian Mining Institute held its ninth annual meeting at the King Edward Hotel, Toronto, on the transacted, and papers, written by men eminent in their profession, were read and discussed. On the evening of the 7th the annual dinner afforded relaxation. The convention, which was an unqualified success, culminated in a two days' visit to Cobalt.

Not in the papers read, nor in the discussions which followed, nor yet in the dinner, lay the principal value of this meeting; but, rather, in the fact that several hundred keen, observant men from every part of Canada were given an opportunity of meeting each other.

A distinguished body of American visitors lent an international tone to the assembly.

The good accomplished by such a meeting is not to be measured. Indirectly, an immense, though indefinite, aggregate of beneficial results may justly be attributed to it. Younger members of the society receive inspiration; older members rub off the encrusting barnacles, and all are brightened and strengthened.

The retiring president, Mr. G. R. Smith, filled the chair with tact and never-flagging enthusiasm.

That careful custodian of the funds, Mr. J. Stevenson Brown, made the most favorable report that the Institute has yet received.

The Institute is deeply indebted to both of these gentlemen, as it likewise is to Mr. H. Mortimer-Lamb, the secretary, who wrought diligently to make the pro- 6th, 7th and 8th of March. For three days business was ceedings a success. Mr. Lamb also was responsible for the very dainty menu card.

POSTAL REGULATIONS

The postal treaty between Canada and the United States expires on May 7th next. It has been proposed that the Canadian Government increase the rate of postage on American periodicals to such an extent as to practically exclude certain classes of journals altogether.

The Canadian Mining Journal has no objection to present against a policy which would tend to diminish the overwhelming flood of obnoxious "literature" with which we are being swamped nowadays. But against any measure which would in any way injure or handicap the circulation in Canada of reputable American technical and scientific periodicals, we must register our unqualified dissent. There is ample room for all such journals. The scope for effort and development in Canada, in matters technical and scientific, is ample. Canada's needs are various. It were both shortsighted and ungenerous to place restrictions upon publications whose missions are the dissemination of knowledge and the fostering and advancement of our most important industries.

EDITORIAL NOTES

Some weeks ago, too late for insertion in the last number, the Journal received an entertaining letter from Dr. A. E. Barlow. Dr. Barlow wrote from Liverpool, in the best of spirits and healt. We are sorry the limitations of space will not permit us to publish excerpts from the letter, one part of which contained a very refreshing description of a winter voyage across the Atlantic.

The Premier of British Columbia in a recent speech asserted that more progress had been made in the development of metalliferous mines during the last year than in any three previous years combined. This fact he attributed to the policy of his Government in introducing no legislation to disturb existing conditions, and he stated emphatically that this policy would be pursued.

An Order-in-Council bearing upon the oil and coal territories of Southeast Kootenay, passed in 1904, declared coal and oil licenses to be issued at the risk of the applicant.

This resulted in confusion and litigation. The British Columbia Government is now introducing an act to rectify matters.

In February's *Labor Gazette* almost all mining districts are reported as active or busy. Edmonton, Alta., Nelson and Nanaimo, B.C., are classed as "very busy." Among the changes in wages and hours recorded is the grant of a bonus of ten per cent. on the gross earnings of its employees by the Western Fuel Company of Nanaimo. The grant is contingent upon the continuance of present conditions in the coal trade. The Wellington Coal Company granted an advance of ten per cent. from January 1st.

As a result of changes in wages during the last quarter of 1906, 1,129 miners were affected, their total weekly earnings being increased by $1,410. The companies granting these concessions were the Cumberland Railway & Coal Company, Springhill, N.S.; the Thetford Asbestos Mines, Que.; the Imperial Oil Company, of Sarnia, Ont., and the British Columbia Copper Company, of Greenwood, B.C. During the month of January, 1907, fourteen miners were killed and twenty-two

When the new Mines Taxation Act becomes law an added obligation will be imposed upon the Ontario Government. In proportion as any mining district contributs to the revenue of the Province, so should the Government acknowledge its responsibility for the construction of good roads, the enforcement of sanitary arrangements in camps, and the many other duties which are the functions of an enlightened administration.

THE CANADIAN MINING INSTITUTE

INAUGURAL ADDRESS BY PRESIDENT GEORGE R. SMITH

OPENING ADDRESS

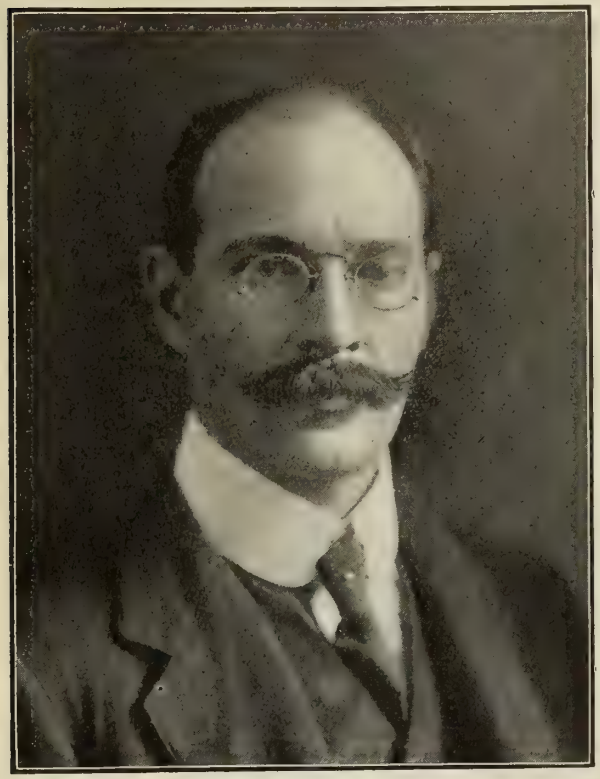
President: Gentlemen, just a year ago, in opening the eighth annual meeting of the Canadian Mining Institute, I was at that time afforded the exceptional pleasure of welcoming you to the cradle of Canadian nationality, that ancient capital of an old French Province so justly renowned for its wealth of historical association, and its peculiarly beautiful surroundings.

RETIRING PRESIDENT—GEORGE R. SMITH

To-day it is my privilege to greet you in the magnificent Queen City of the great and wealthy sister Province of Ontario. Last year we peered together through mists of vanishing years into the early days in the history of New France, when the development of mineral wealth in North America by European settlers was aided by the fostering care of that great French Minister, Colbert. To-day we meet in a Province possessing, I believe, the youngest Bureau of Mines of any of the older Provinces of the Confederation, and in which State encouragement and recognition of the mining industry can scarcely be traced back more than fifteen years, as compared with the two and a half centuries which have elapsed since the French Minister of State rendered his powerful patronage to the first practical mining essays in New France. It is said, nevertheless, that as early as 1660 the Jesuit missionaries reported gold having been found on St. Joseph's Island, in Lake Huron, and Mr. Merritt tells us that copper ore was actually worked in this Province in the vicinity of Point of Mines or Mica Bay as early as 1770, an English company having sunk a shaft into a vein, which afterwards decreased, and was abandoned. I am not going into the details of the early operations of the Bruce Mines, or the circumstances which attended the production in 1880 in Leeds county of iron manufactured from ore exploited in that vicinity. For a great number of years the mining development of this Province was extremely intermittent, chiefly owing to the fact that no smelting was carried on here, and that the demand for ore came chiefly from the other side of the international boundary line. Yet, in recent years, the advance of mining operations in Ontario has been little short of marvellous.

Metallic productions alone in Ontario increased from $2,565,286 in 1900 to $5,321,677 in 1904. And from 1904 to 1907 I do not think anyone would dare to predict what they will be, but there is little doubt there will be an increase. The output of silver, cobalt, iron ore, pig iron and steel was given as nil in the report of the Bureau of Mines for 1895, and in 1904 the output of silver was placed at $111,887; of cobalt, $36,620; iron ore, $108,068; pig iron, $1,811,664, and of steel, $1,888,349. The report of your Minister of Mines for 1905 claims that the Sudbury nickel-copper deposit constituted the chief source of the world's supply of nickel. The output of nickel in that year was given as $3,344,409, while the copper contents of the matte amounted to $671,833, and if these products had been computed at the price of refined metals, as is done by many public statisticians, their total value would have been little short of $10,000,000, while employment was furnished in this industry to over 1,000 men.

PRESIDENT—MR. FREDERIK KEFFER, GREENWOOD, B. C.



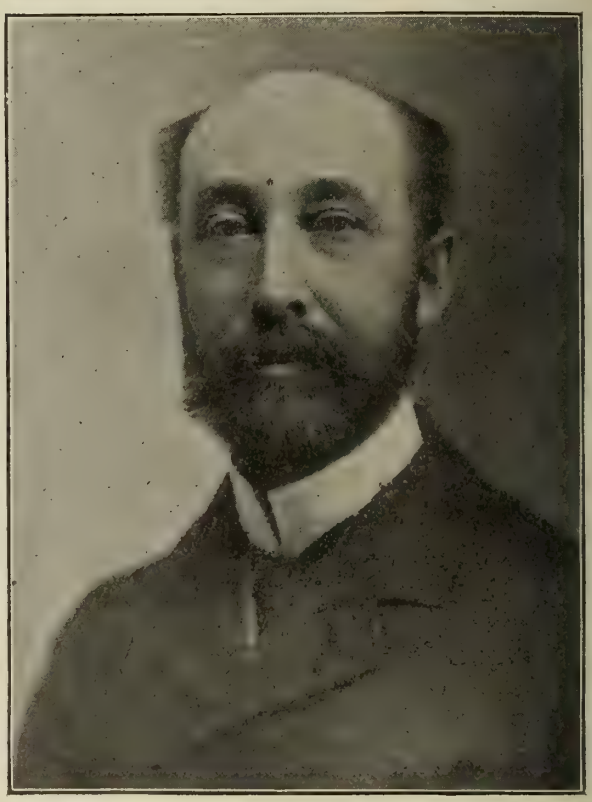
To all these facts and figures, illustrative of the rapid development of your mining industries in recent years, there is yet to be added the marvellous story of Cobalt, which has already proved itself to be the second Klondyke in the world-wide interest which it has aroused. Your Province is also to be congratulated in possessing in the person of your active Minister of Mines, the Hon. Mr. Cochrane, one who has not only taken the keenest interest in the industry, but has also borne in mind in his recent legislation the protection that is due to individual rights. I would not, however, lead you to believe that you hold all the silver and other good things in the country. We, in Quebec, on your eastern boundary, have a great undeveloped mining territory within ten or twenty miles of you in the Temiskaming country. You are more fortunate in your Cobalt district than we in our ore, because of the railway facilities which you have. The railway development gives you direct transportation facilities to the very mouth of your most valuable mines, yet it is only a question of time when we, too, shall have railway communication with the great northern mineral belt of our Province, and communication which, I hope, shall prove valuable to both Provinces.

Last year I remarked on the development in mineral resources that would follow the construction of the Trans-Continental Railway. I am more than ever impressed with the assurance of this fact.

We, in Quebec, are only most anxious to join with you in Ontario, without regard to any political considerations, in assuring the best possible legislation for the interests of the mining industry in general, as well as for those who are practically engaged in it. It is certainly to be hoped that the time is not far distant when we shall have Canadian smelters treating Cana-

dian ores at home, instead of having to ship these latter to the United States for treatment.

The Institute has already proved its efficiency and its ability to largely assist the miner in performing his work and carrying out his ideas generally. I might add that it is only by constant concerted action of this kind that the miner can feel that from Sydney to the



THE SECRETARY—MR. H. MORTIMER-LAMB
Montreal, Que.

Yukon his interests are thoroughly protected, and this unity of purpose and action is bound to secure for the mining men that reasonable legislation which is necessary to the successful carrying out of their work and business. The annual increase in membership shows the popularity of this institution. The modern idea among all professional and scientific classes, civil, mechanical and mining engineers as well, of becoming incorporated for mutual benefit and support, can result only in good. There may be a feeling on the part of some of us that our by-laws, or our methods, or the result of our elections, are not in accord with the ideas of all our members; but our constitution and our by-laws themselves provide any remedy that may be desired in this respect, and after due notice they may be readily amended. Nevertheless, no particular province, nor yet any set of men in the Dominion, should, however, in my opinion, ask for special provisions to meet special circumstances unless with the concerted motion of the whole Institute. It is well that outsiders should know as well as we do that the Institute is not for the benefit of speculators or mining manipulators, but was established, and is maintained, for the advancement and protection of the genuine mining interests all over the country; and, generally to render this work effective and its influence paramount, it is first of all essential, of course, that it should have our loyal adhesion and support as members. Then, while our individual operations, and even the industry as a whole, may have their respective ups and downs, the Institute, I trust—like Tennyson's Brook—will flow on for ever; and, although Cobalt, contrary to every indication, should see its failure, as Port Arthur did some twenty years ago, the Mining Institute would continue its useful career for future generations of mining men.

Gentlemen, it is scarcely possible to declare that the present meeting in this hotel is opened without a passing reference to the unfortunate circumstances attending our former meeting here. There can be no doubt whatever that the regretted death of our late esteemed secretary—Mr. B. T. A. Bell—upon the very eve of the meeting, placed a damper upon the entire proceedings of the convention of that year, so that it was scarcely possible for the City of Toronto, or the Province of Ontario, of which it is the splendid capital, to have formed from that meeting any fair idea of the importance or the influence of this Institution. We meet again to-day in Toronto, not only as one of the mining centres of the Dominion, but the centre of the Dominion from the mining standpoint.

In declaring this ninth annual meeting of the Canadian Mining Institute open for the despatch of business, it is in no purely formal manner that I express the fervent hope that you are each and all a unit in contributing to its interest and success. The papers that are to be read cannot but prove instructive to every mining man, covering, as they do, everything in our mining interests, from coal to gold. It only remains for me to

THE TREASURER—MR. J. STEVENSON BROWN
Montreal, Que.

thank you, gentlemen, for having honored me with the highest office in your gift, and to ask from you continued confidence and support through the sessions of the present convention.

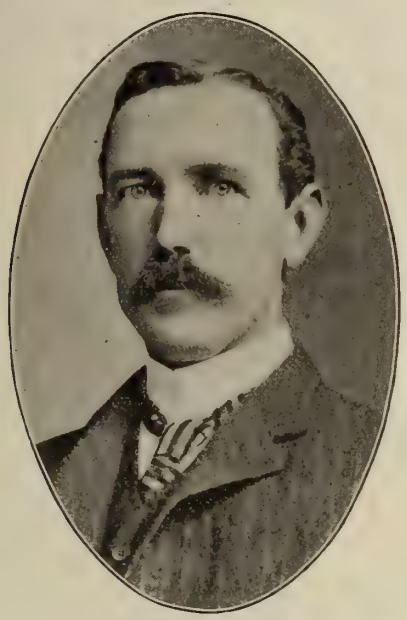
I believe, gentlemen, in conclusion, that in meeting here in Ontario that there are some vital issues

that keenly interest the gentlemen engaged in the mining industry in this Province. It is the duty of this Institute to do all that they can to assist you, and I believe that we come here prepared as an Institute to take up your grievances—whatever they may be—and do all that we possibly can for the best general good of the Institute first, and your interests in general.

VICE-PRESIDENT—Mr. J. BONSALL PORTER,
Professor of Mining, McGill College, Montreal.

VICE-PRESIDENT—Mr. W. FLEET ROBERTSON
Prov. Mineralogist of British Columbia, Victoria.

VICE-PRESIDENT—Mr. W. G. MILLER,
Provincial Geologist of Ontario, Toronto, Ont.



I thank you very much for your kind attention, and, just before starting the regular business of the meeting, I might add that the question of legislation will be taken up this afternoon; the question of legislation as regards the mining tax in Ontario. I hope you will all —those of you particularly interested in it—come here and lend us your best efforts, to see if anything can be done to make the Hon. Minister of Mines see things, if possible, from the mining standpoint, which, we believe, will result in the general good of the Province. (Applause.)

REPORT OF THE COUNCIL FOR THE YEAR 1906-1907

Meetings.

The eighth annual general meeting of the Institute was held at the Chateau Frontenac, in the City of Quebec, on March 7th, 8th and 9th, 1906. The meeting was an unqualified success, and the Council again records its appreciation of the services rendered by Dr. J. Bonsall Porter, to whom, as acting secretary, fell the chief responsibility of organizing and carrying out the arrangements in connection with the proceedings.

During the year meetings of Council were held at headquarters. As provided by par. XXXII. of the by-laws, typewritten copies of the minutes of these meetings have been regularly sent to each individual member of the Council, affording those members residing at a distance and thus precluded from personally

Mr. JAS. McEVOY, Mining Geologist,
Crow's Nest Pass Coal Co., Fernie, B. C.

Dr. FRANK D. ADAMS,
Logan Prof. of Geology, McGill Univ., Montreal.

attending, an opportunity of presenting their views on all matters of business coming before the Council. It is hoped that in future full advantage will be taken of this provision, that the Institute may derive the benefit of the advice and active interest of every member elected to serve on its Council.

Publications.

Thirty-four papers were presented at the Quebec meeting, and these, with the discussions thereon, and a report of the proceedings of the meeting, now form Vol. IX. of the Journal of the Institute, which has been issued to members in good standing.

Membership.

It is gratifying to be able to record an important increase of approximately twenty-five per cent. in the membership during the year, which now, including students, for the first time exceeds five hundred names. This may be regarded as indicative of appreciation and recognition on the part of those engaged in the development of our mineral resources, of the useful work this

Mr. FRANK B. SMITH, Edmonton, Alta.

Mr. R. W. BROCK, Ottawa, Ont.

Mr. J. C. GWILLIM, Kingston, Ont.

Institute is attempting to perform in the interests of mining in the Dominion.

Deputations.

Pursuant to a resolution unanimously passed at the Quebec meeting, requesting the president to appoint a delegation to wait on the Dominion Government and urge the desirability of the early establishment of a Federal Department of Mines, under the direct supervision of a responsible Minister of the Crown, a deputation, of which the following gentlemen were members, Messrs. Smith, Adams, Porter, Drummond and Brown, proceeded to Ottawa on April 18th, and presented the views of the Institute to Sir Wilfrid Laurier and his colleagues, by whom they were most favorably received. Within a few weeks of this interview, the office of Director of the Geological Survey of Canada, which had remained vacant since the death of the late Dr. George Dawson, C.M.G., was filled by the appointment of Mr. A. P. Low, whose interest in that branch of geological science which deals more particularly with the solution of economic problems, is well known. The work of the Survey during the past year, under Mr. Low's direction, has been of an eminently useful and practical character; and the appointment of that gentleman to the head of the Survey is a matter for congratulation on the part of the mining industry in Canada. Following the appointment of Mr. Low to the Directorship, the Survey was disassociated from the Department of the Interior, and placed under the Ministerial charge of the Hon. Mr. Templeman. Although, as yet, the bill for the establishment of a Department of Mines has not been introduced into Parliament, it is understood that such a measure is now under contemplation, and it is hoped, therefore, that before another year shall have passed the wishes of the mining industry in this important respect will have been realized.

Library.

During the year an addition of some fifty volumes was made to the library, and a number of exchanges, including transactions of technical societies, official report and periodicals, covering a period of three years, were bound and added to the shelves. A new catalogue, on the card index system, has also been prepared. The librarian desires to thank in particular the Geological Survey of Canada, the British Columbia Bureau of Mines, the Mining Society of Nova Scotia, the Institution of Mining Engineers and the Mining Institute of Scotland for the donation of valuable early editions required to complete the library sets.

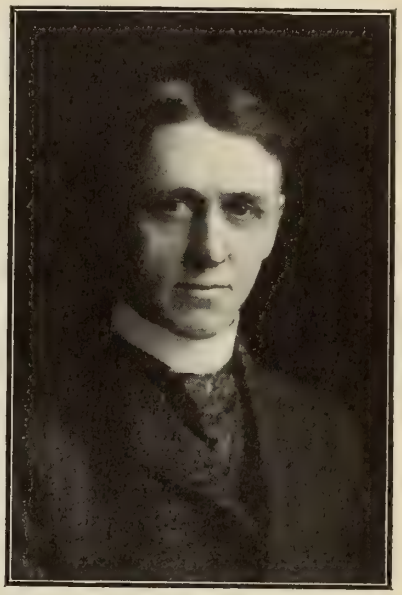
Students' Competitions and Awards.

After receiving the report of the judges, Messrs. Charles B. Goring and Frederick Hobart the Council awarded the president's gold medal, for the best paper submitted by a student member during the year, to Mr. Frank G. Wickware, of McGill University, for his thesis entitled "The British Columbia Copper Company's Mine and Smelters." In commenting on this paper, the judges made the following remark: "We would assign first place to Mr. Frank G. Wickware's paper on account of the comprehensiveness, clearness and ability shown in his descriptive treatment, the good literary style, and the judgment and care shown in arranging and preparing the paper. It is orderly and methodical, well illustrated, representing careful and painstaking work, and appears to us to be worthy of special commendation. A strong point is the inclusion of data in relation to

costs of working, which are a critical point in all mining and beneficiating operations.. It is also to be considered that the paper relates to a Canadian mining enterprise of importance." It may not be inappropriate to add that, in consequence of the general excellence of this paper, Mr. Wickware was offered, and has accepted, the post of assistant editor to so important a technical periodical as *The Engineering Magazine*, of New York and London.

The Council also awarded three cash prizes of $25 each, as follows: To Mr. Frank B. Wickware, for the paper mentioned above; to Mr. J. J. Robertson, School of Mining, Kingston, for his paper entitled "Cyanide Tests on Temiskaming Ores," and to Mr. R. P. Cowen, McGill University, for his paper entitled "Number Four Pit, Brayton Domain Collieries, Cumberland, England."

The Council takes pleasure in congratulating the above gentlemen on the very creditable papers they have presented to the Institute.



H. MORTIMER-LAMB,
Secretary.

MR. E. W. GILMAN, Montreal.

MR. H. E. T. HAULTAIN, Craigmont, Ont.

MR. DAVID BROWNE, Copper Cliff, Ont.

The ninth annual meeting of the Canadian Mining Institute was formally declared open by the retiring President, Mr. G. R. Smith, on the morning of March 6, at the King Edward Hotel, Toronto.

WEDNESDAY.

During the morning President Smith delivered a forceful address which is reproduced on page 36.

Reports of the treasurer and secretary were read. Both showed a very encouraging condition of affairs. A balance of $1,300 remains to the credit of the Institute after all claims are paid, and an increase of over 20% in the membership was recorded.

MINERAL STATISTICS.

Mr. J. McLeish, of the staff of the Mines Section of the Geological Survey of Canada, presented a statement in detail of mineral production in the Dominion for the past year, the estimated value of which were shown to aggregate over eighty million dollars, or an increase of twelve million dollars as compared with the returns for 1905.

In the discussion that followed Mr. E. Coste pointed out that this increase in twelve months represented rather more than the mineral production of Canada some twenty years ago, at which time he was in charge of the Statistical Department of the Geological Survey.

AMENDMENTS TO THE BY-LAWS.

A number of amendments to the by-laws were then introduced and finally passed, the most important of which provided for the raising of the standard of membership, by creating a new class of associate membership, to which in future those not directly or technically qualified for membership will be admitted. It was also decided to increase the number of council from sixteen to twenty, and a further amendment provided for the abolition of the Nominating Committee, leaving nominations for officers and council to be submitted by individual members.

PROPOSED MINES TAXATION IN ONTARIO.

Mr. J. M. Clarke, K.C., then read a paper on "Mining Royalties," which was productive of an interesting discussion in criticism of the bill recently introduced by the Ontario Government, proposing a tax on mines in that province.

Mr. Clarke pointed out that the bill aimed at taxing mineral areas to which absolute title had previously been granted, and on which the province had pledged itself not to impose royalties.

Mr. Coste added that the incidence of the tax was unjust in many respects, while in the case of the proposed tax on natural gas, the provision for the measurement of gas at the mouth of the well was absurd and impracticable. A Mr. White, representing American capital in Cobalt, having received permission to address the meeting, stated that, in view of the introduction of the measure by the Provincial Government, his principals, who were engaged in legitimate mining and were not company promoters, had decided to withdraw from the field.

It was then moved by Mr. Craig, seconded by Mr. Hardman, and carried, "That the Canadian Mining Institute, in annual meeting assembled, believe that the bill now before the Ontario Legislature, providing for the confiscating of mines, is opposed not only to the mining interests but also to the manufacturing and the agricultural interests of the province, and we as a body respectfully ask the Ontario Government to take time and carefully consider what have been the effects of mining legislation in other countries and in other provinces on such lines as now proposed, before allowing this bil lto become law." On motion it was decided that a deputation of fifty gentlemen representing the Institute should wait on the Hon. F. Cochrane, Minister of Mines, to present the above resolution, and Messrs. Clarke, Leonard, Hardman, Hay and the president were deputed

to address the Minister on the subject of the resolution. The meeting, after some further discussion, adjourned to the Parliament Buildings, where the deputation waited on Mr. Cochrane and his colleagues. The Minister invited a full discussion of the bill, and asked that a committee from the Institute meet again with him on the following Friday afternoon to discuss suggested amendments. This invitation was accepted, and, after seeing Mr. Cochrane on Friday, the committee presented the following report:—

Report of Committee on Mining Taxation.

The committee appointed by the Canadian Mining Institute to interview the Hon. the Minister of Mines concerning the bill for the taxation of mines in the Province of Ontario, met the honourable gentleman on Wednesday afternoon, accompanied by a delegation of fifty members of the Institute. On the invitation of Mr. Cochrane, the committee again met in the Minister of Mines' office on Friday at twelve o'clock. There were present at this interview the Premier, Mr. Whitney, the Provincial Secretary, Mr. Hanna, and the Minister of Mines, Mr. Cochrane.

Many paragraphs and features of the bill, together with the principle of the measure, were discussed, especially the objections which were submitted in a series of resolutions adopted by a full meeting of the Institute on Thursday afternoon and which were immediately transmitted to Mr. Cochrane. While the committee adhered firmly to the resolutions passed by the Institute, yet upon the personal assurance of the Minister that he would modify certain clauses to meet objections, which were stated, and upon his statement that some measure for revenue would have to be enacted at this session, and his further assurance that, as Minister of Mines, he would see to it that the execution of the law should be made as little onerous as possible, that he would be willing to support a new bill drafted to meet the views of the mining community of the province, if the same were prepared within a year, the committee decided to leave the matter in the hands of Mr. Cochrane for this year. They pledged themselves to submit to him within twelve months the draft of a new bill, which would be more acceptable to the mining interests of Ontario. This action was taken in consequence of the personal confidence which the representatives of the mining industry in Ontario have in Mr. Cochrane.

Wednesday Evening.

At 8.30 p.m. Mr. H. H. Stoek, editor of *Mines and Minerals*, of Scranton, Pa., delivered an interesting and instructive address, illustrated by lantern slides, on "Preparation and Mining of Anthracite in Pennsylvania." Mr. Stoek, to whom was accorded a vote of thanks, was followed by Mr. E. Coste, who read a paper on the "New Tilbury Oil Fields."

A very interesting discussion resulted form the reading of a paper by Mr. J. C. Gwillim, of Kingston, on the "Status of the Mining Profession in Canada, in which Dr. Ledoux, Mr. Coste, Dr. Porter, Dr. Goodwin and others took part.

Thursday Morning Session.

A very interesting discussion resulted from the reading of a Miller, Provincial Geologist, in explanation of some additions to the map of Cobalt district. Mr. Miller stated that on the occasion of last annual meeting of the Institute in Toronto, three years ago, the Bureau of Mines displayed for the benefit of the members a fine exhibit of Cobalt ores, but that very little notice was taken of it, and it took the public eighteen months to awaken to the fact that the Cobalt district was worthy of attention. In the meanwhile the profits of mining in this small area had already made millionaires of eight or ten men, while some twenty or thirty others had, by legitimate means, amassed fortunes of from $25,000 to $300,000. Mr. Miller explained that his map of the district had been drawn to on a scale of 400 feet to the inch, and all the known veins had been drawn to scale. He stated that there were roughly a hundred, probably, productive veins in the district, while others were being constantly uncovered.

The Geology of the Cobalt District.

Dr. C. K. Van Hise, president of Wisconsin University, Madison, Wisconsin, then delivered a lengthy and most valuable address on the "Geology of the Cobalt District," of which we print an abstract elsewhere in this issue. The paper was discussed by Mr. Ingall, Mr. Hixon, Mr. Coste, Dr. Bell, Mr. Miller, Mr. Tyrrell, and Mr. Brock. Dr. Bell also read a paper on the Cobalt district, embodying the views contained in his report to the Geological Survey.

In the afternoon Mr. Hiram W. Hixon read a paper on "The Smelting of Cobalt Ores." The following papers were also read: On "The Minerals of Alberta," by Mr. D. B. Dowling; "The Grondal Processes of Concentration," by Mr. P. McN. Bennie; on "Electric Furnaces," by Dr. A. G. Stansfield; "Sir William Logan and the Geological Survey," by Dr. Robt. Bell, and on "Magmatic Waters," by Mr. H. W. Hixon. This last paper created a lively discussion, in which the author found himself pitted in the lists with such doughty scientific champions as Dr. Kemp and Dr. Coleman.

The Annual Dinner.

Members and the guests of the Institute, including His Honor the Lieutenant-Governor of Ontario; the Hon. Frank Cochrane, Minister of Mines; the Hon. Mr. Hanna, Provincial Secretary; the Mayor of Toronto, Dr. Van Hise, Dr. Kemp, Dr. Chamberlain, Dr. Baylie Willis, Dr. Wm. Campbell, and others, assembled in the "Yellow Room" of the King Edward Hotel at 8 p.m., when a short reception was held. Dinner was served in the banquet hall at 8.30, covers being laid for a hundred and thirty.

The table was very tastefully decorated, and the tables arranged to seat parties of six, exclusive of the head table, reserved for the guests of honor, at which the president, Mr. G. R. Smith, presided. Seated on his right was His Honor the Lieutenant-Governor, and on his left the Hon. Frank Cochrane.

The toasts, "The King," and "The President of the United States," having been received with musical honors, the Hon. W. Mortimer Clark, Lieutenant-Governor of the Province, responded in an able and witty speech on behalf of the Dominion and Provincial Governments. The speaker, in passing, stated that he had not had much experience in mining, although he had essayed some experiments, and in consequence had made several very "permanent investments." Mr. Cochrane and Mr. Hanna also responded to the same toast, and the new Canadian National Anthem, the music of which was composed by Dr. Albert Ham, was sung by a trio of professional singers and greatly applauded. "The Mining Industry" was responded to by Mr. J. E. Hardman and Dr. Kemp; "Sister Societies," by Dr. Ledoux, past president of the American Institute of Mining, Mr. R. W. Leonard, representing the Canadian Society of Civil Engineers, and Mr. Corbett, representing the Mining Society of Nova Scotia; "Our Guests," by Dr. Van Hise, Dr. Chamberlain and Dr. Willis; and "The Press," by Mr. Frederick Hobart, associate editor of *The Engineering and Mining Journal* of New York; Mr. H. H. Stoek, editor of *Mines and Minerals*, Scranton, Pa., and Mr. J. C. Murray, editor of The Canadian Mining Journal. At midnight the evening was (officially) brought to a close with the singing of "Auld Lang Syne" and the National Anthem. After which, however, Mr. G. R. Smith gave a lucid and thoughful address on the text, "Why Are We Here." His efforts were ably supported by a distinguished guest of the evening.

Friday Morning Session.

The session opened at 10.30 a.m., when the president announced the result of the election of officers and council for the year 1907, as follows:—

President—Mr. Frederick Keffer, Greenwood, B.C.

Vice-Presidents—Mr. W. G. Miller, Toronto, Ont.; Mr. W. Fleet Robertson, Victoria, B.C.; Dr. J. Bonsall Porter, Montreal.

Secretary—Mr. H. Mortimer-Lamb, Montreal.

Treasurer—Mr. J. Stevenson Brown, Montreal.

Council—Mr. E. W. Gilman, Montreal; Mr. Jas. McEvoy, Fernie, B.C.; Mr. Frank B. Smith, Edmonton, Alta.; Mr. R. W. Brock, Ottawa, Ont.; Mr. J. C. Gwillim, Kingston, Ont.; Dr. F. D. Adams, Montreal; Mr. H. E. T. Haultain, Craigmont, Ont.; Mr. D. H. Browne, Copper Cliff, Ont.

On motion of the secretary, Mr. John A. Dresser, M.A., of Montreal, was elected to fill the vacancy on the council occasioned by the election of Dr. Porter as a vice-president.

The following papers were then read:—

"On the Microscopic Examination of Nickeliferous Pyrrhotite," by Dr. Wm. Campbell, of New York.

"The Marble Bay Copper Deposit, Texada Island, B.C.," by Mr. O. E. Leroy, of Ottawa.

"On the Progress of British Columbia's Mineral Production, 1897-1906," by Mr. G. Jacobs, editor of the *British Columbia Mining Record*, Victoria, B.C.

"The Geology of the Franklin District Ore Deposits, B.C.," by Mr. R. W. Brock, of Kingston, Ont.

AFTERNOON SESSION.

The secretary, having read a letter from the Institution of Mining and Metallurgy, on the subject of standardization, the following committee, Dr. Porter, Mr. Haultain and Mr. Willmott, were appointed to convey the views of the Institute on the subject to the Institution of Mining and Metallurgy.

Dr. Ledoux then gave a short address on the "Richness of Cobalt Ores," which we hope to publish in a future issue.

Papers were read, by Dr. Kemp on "Some New Points in the Geology of Copper Ores," by Wm. Fritz Cirkel on "The Mineral Resources of the Province of Quebec," and by Mr. H. J. Carnegie Williams on "The History of the Bruce Mines, Ontario," and the meeting closed with a vote of thanks to the retiring president.

THE C. M. I.—A BRIEF HISTORICAL SKETCH

BY THE SECRETARY, H. MORTIMER-LAMB.

In writing an account of the history of the Canadian Mining Institute, it is not quite easy to determine where to begin. Officially the Institute, as at present constituted, is nine years old, dating its birth from its incorporation by charter, granted by the Dominion Government in the year 1898. But the germ of the idea was conceived long before then in the active brain of a man, to whose strong personality, energy and public-spiritedness, we as an organization owe so much.

Going back to the old records, we find that no successful effort had been made to secure a general conference of those engaged in mining in the Province of Quebec until 1891, when B. T. A. Bell took the matter in hand and organized the General Mining Association of that province. Again, in 1892, he was the prime mover in the organization of the Mining Society of Nova Scotia, of which he became honorary secretary, and in 1894 he organized the Ontario Mining Society. But Bell was not satisfied with these efforts. He was an ardent champion of national unity, and he found strong support in such men as G. E. Drummond, Hardman, Fergie, and others, in the promotion of his scheme for federating the several provincial organizations and forming one representative body of men engaged in the business of mining in Canada. The plan was first mooted in 1893, and agreed to by the three provincial societies at a united meeting of members at Sydney, Cape Breton, in July, 1894. But it was not until 1896 that the Federated Canadian Mining Institute came into existence, with that staunch veteran, Major R. G. Leckie, who is still the youngest of us all, as the first chairman. The objects of the Federated Institute, as set forth in the constitution, were:

(a) The publication in one volume of the papers and proceedings of the several organizations in the Federation.

(b) Action upon all matters affecting or relating to the mineral industries of Canada.

The Federation continued in existence for two years, serving a useful purpose, but with the growth of the industry it was decided in 1898 that the time was opportune for a re-organization on a more comprehensive scale.

The committee added: "We cannot consider that the Federation has successfully accomplished the purpose of its foundation, in that it has brought together for their mutual benefit the different members of the different provincial organizations, and has created and extended a knowledge of our resources, methods and different personalities. . . Recognizing, however, that Canada is but just beginning her career as a mineral country, and that our position is much more permanent to-day than ever it has been, we cannot be blind to the necessity of providing more funds, for the proper publication of our transactions, than the Federation possesses under its present form of organization."

So the affairs of the Federated Institute were wound up, and from its ashes, Phœnix-like, arose the Canadian Mining Institute, with an initial membership of somewhere in the neighborhood of two hundred representative men. The new charter stated that the association had been founded for the following commendable purposes:—

"First, to promote the arts and sciences connected with the economical production of valuable minerals and metals, by means of meetings for the reading and discussion of technical papers, and the subsequent distribution of such information as may be gained through the medium of publications. Second, the establishment of a central reference library, and a headquarters for the purpose of this organization. Third, to take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada. Fourth, to encourage and promote these industries by lawful and honorable means."

The record of the work done in the past few years, the high standard of excellence of many of the papers contributed to the transactions of the Institute, and the influence the organization has been able to exert in opposing both Federal and Provincial legislation inimical to the interests of the mining industry, stands for itself.

A word, however, in conclusion, of the men who have helped to make the Institute what it is. After Bell, no one man has worked harder or to better purpose in the interests of the organization than its first president, John E. Hardman. Not only was he during his term of office (1898 and 1899) the ideal presiding officer, impartial, firm, resourceful and eloquent; but for the many years he has served on the council he has ever been ready to sacrifice his private interests to the good of the Society. Whether it was in acting gratuitously as the custodian of the library, serving on committees and deputations, or undertaking secretarial work when it became necessary for some one to act, his services might always be depended on.

But then the Institute has been extraordinarily fortunate in its presidents. I believe it is recorded that Mr. Fergie, during his two years of office, never missed a council meeting, and, when it is remembered that the journey from Nova Scotia to Montreal is somewhere in the vicinity of a thousand miles, this singular instance of devotion and attention to a duty is probably unique. Both Mr. Coste and Mr. G. R. Smith have also done yeoman's service, the former acting as president during a critical time in the history of the Institute when, just before the annual meeting of 1904, Mr. Bell met his death in so tragic a manner. As to Mr. Smith, we have hardly yet accustomed ourselves to regard him in the past tense. He has been the life and soul of the last two annual meetings, and under his presidency the Institute has prospered and grown in influence and usefulness.

The Institute is, meanwhile, to be congratulated in the election of Mr. Frederic Keffer as president for the current year. He is an engineer of very eminent attainments, and enjoys the esteem and respect of all who have the privilege of his acquaintance.

THE GEOLOGY OF THE COBALT DISTRICT

ABSTRACT OF PAPER READ AT MEETING OF CANADIAN MINING INSTITUTE, BY PRESIDENT C. R. VAN HISE, MADISON UNIVERSITY, WISCONSIN.

I had thought of talking, not on the geology of Cobalt, but rather on the ore deposits of that district. The foundations of everything I shall say have been laid by Professor Miller. I myself have learned to appreciate very deeply the accuracy, carefulness, faithfulness and correctness of the geologic work that has been done in the Cobalt area. For many years, however, I have been interested in the general principles concerning the deposition of ores, and from that point of view I have approached this district. What does this district afford in confirmation of any variation from the principles of ore deposition, which have been the subject of study by so many geologists for so many years? This origin, it seems to me, is one which illustrates broadly and well certain principles of two concentrations.

In common with many other geologists, it has been a question with me as to whether or not ore depositions are usually produced by one or two or several concentrations; and very few of the districts which I have visited will exhibit more than one concentration. The history of the ore deposit is not simple, but is usually very complex. One geologist will say that certain ore depositions are produced altogether by magmatic segregation; another, that they are due to ordinary vein action through circulating waters. Others will say that they are due to atmospheric waters.

In almost all cases of dispute, when I have been so fortunate as to go into the district, I have found the story to be a complex one; that each man has had a part of the truth. So these different views are all partial truths.

I have been in Cobalt district only a short time, and could have done nothing, except for the foundation work which I have mentioned; but very early I became convinced that this was an origin in which there had been two periods of concentration—a concentration under deep seismic conditions, free from oxygen, a deep-seated circulation (I know nothing as to whether the waters were atmospheric or magmatic, or partly one and partly the other) in which the oxides and arsenides of cobalt and nickel were deposited in large measure; and that since that time there has been a secondary concentration, which was the result of surface waters descending or travelling laterally, connected in a way with the surface and producing the effect of oxidizing waters. The ore deposits, to be adequately explained, must be the result of this deep-seated circulation producing ores in one form, and of a modifying surface circulation.

The first year I was in the district both Professor Miller and I were inclined to believe that the native silver came in connection with late secondary fracture and surface circulation. It appeared perfectly clear that in many of the veins the cobalt minerals were early products of the deep-seated concentration. Then there was a lateral fracture, followed by the injection of silver-bearing solutions, and as a result of the reducing action of the cobalt minerals the metallic silver was thrown down.

I would by n omeans assert that this is the case with all the metallic minerals. But this suggestion explains many curious things, which you will see when you visit this district. A vein following along the strike shows extraordinary variations in richness, both vertically and laterally. If all the minerals came in at the same time, why should not the silver be somewhat evenly disseminated? When you examine the deposits closely you find that frequently those richer deposits are in places where the veins have been shattered comparatively later, and the silver-bearing solutions have been reduced by contact with the cobalt minerals. This is exactly analogous to the deposition of gold in the San Juan district in Kansas and Southwestern Colorado. Here there were high-grade values at the surface, but deeper the ores became very lean, although the veins were persistent. But in the Smuggler-Union mine, and the Camp Bird, and others, you find a zone of shattering with very rich streaks of gold.

Now the question arises, to what extent are the Cobalt deposits the result of one segregation, and to what extent the result of two?

I am myself, at the present moment, wholly unable to answer that question. It will be one of the problems which the Canadian geologists will work out. But one thing is certain—that those extremely rich superficial depositions of a few feet in thickness, which are connected directly with the weathering, have been produced by two concentrations, one being under deep-seated conditions, when the atmospheric waters were not present, and the other occurring along with erosion. We must remember that in the past these veins went up into the atmosphere to an unknown extent. The veins have been eroded profoundly. Take the veins at the level of ground circulation. In the case of the argentite, it will be oxidized by the atmospheric waters to silver sulphate, which is rapidly soluble. It will be picked up by these waters and carried down into the veins where, coming in contact with the cobalt minerals, the silver will be precipitated in irregular nuggets. Some of these nuggets have reached a depth in the vein. Many have been carried away by subsequent erosion, in fact a vastly greater number than have been found must have been scattered abroad.

Thus this extremely rich upper belt which is so characteristic of Cobalt is unquestionably the result of two concentrations. But most of the mines depend not upon this surperficial zone but upon a horizon which is down below. To what extent has this deeper horizon been the result of a single concentration under deep-seated conditions and, later, of concentration under surface conditions? I am unable to give a definite answer. I am, however, willing to express an opinion. I believe that the secondary concentration, even for this main belt, has had important additions during this secondary concentration. Whether its main richness was thus produced is something for the future to decide.

A very important question now comes up as to the relation of the ores to the diabase. My judgment coincides with that of Professor Miller, that probably the diabase is the source of the ore. The reason for this belief is that those Keewatin and Huronian rocks seem to be in all respects similar to that great double series of formations from Port Arthur to Cobalt. In other words, there are 500 miles of distance through which these Keewatin rocks occur, and conglomerates similar to the Cobalt conglomerates.

Then if the source of the ore was either the conglomerates or the Keewatin, why have not other districts been found in this great area? Doubtless other districts will be found; but this great region has been worked over so thoroughly in such areas as the Lake of the Woods and others, as to make it extremely improbable that the exceptional conditions are associated with the ancient igneous rocks, the ancient floor which was associated with the Huronian conglomerates and slates. Naturally, you associate the exceptional conditions with the sheet of diabase.

But it may be said also, the diabase, as an intrusive rock, occurs all the way from Port Arthur to farther east than this, and is all somewhat similar to this. This is true, but it does not at all follow that when they came up from the reservoirs of this area some exceptional materials were not added. This was true of the Sudbury deposition. There were here exceptional additions after the ignious rocks. And so I believe that the

source of the cobalt nickel and silver mineral is the diabase. How is it that the veins are in the diabase and partly in the diabase and the conglomerate, and also in the Keewatin? Before answering this last question, let us glance at the distribution. Is this diabase a comparatively thin layer separating other layers, or is it great stack that goes down vertically? It seems to me that we have almost conclusive evidence on this point beyond the evidence that Professor Miller has given. If this diabase were a great round mass like this, going down and becoming bigger, then you would have such conditions as you have west of Lake Superior. These layers would be strained and turned back on one another. This is not the case here. There is a gentle series of rolls and folds. There has been no straining. Therefore, Professor Miller must be right in saying that this is a flat sheet. But he has not used the argument, which to me is even more conclusive than the observed facts. It takes hundreds of years for a great sheet like that to come into this region, and that great sheet first cooled along the contacts . While the outer parts solidified, the larger part of the mass was still liquid. Conditions were now favorable for emanations to come from this rock; for fractures to form consequent upon the gentle folding and lifting of the cooling mass. Solutions formed in the cooler parts of the diabase would be set free by these motions, and would carry their cobalt and silver minerals to the fissures and cracks formed by contact with the conglomerate and Keewatin. The fact that the larger mines in the Diabase are close to the conglomerates and slates, confirms this hypothesis. Some mines are farther away; but there is every reason to believe that the diabase did lap over to the west and was eroded away.

What part did the Keewatin play? It seems to me that the Keewatin, with its great abundance of the gangue mineral calcite, which does not occur in the diabase, provided the precipitating agents, and that the source of the ore was the diabase.

If this is true, you have a still further reason for the association of the ore depositions with this wider belt. The men of the district know empirically that they need not go off in the centre of the diabase. They know that the deposits have been found within reasonable distance of the diabase. But the conclusion must not be carried too far. There are possibilities where you find only conglomerate or Keewatin. Diabase may have been there as a capping material and may have been wholly removed by erosion. But where you get all the conditions together, there is the most favorable place to work.

One further point is important. This deep segregation occurred when the diabase was over the rocks. The circulation, the deposition of material was in the conglomerate, in the Keewatin, and in the lower part of the diabase. There may have been depositions over it, but the main depositions were under it. It follows that it is the legitimate task of exploration to follow this horizon of ore-bearing material down under the diabase.

If it does turn out that this is a legitimate horizon for work, then we shall find out what effect the primary concentration and what the secondary has accomplished. What the results of that comparison will be the future only can tell.

Therefore, in conclusion, I may say that I believe the ore depositions of the Cobalt district to have been produced, not by a single concentration, but two concentrations, one of them under deep-seated conditions, the cource of the ore being the diabase, the precipitating agent being probably in the conglomerate. This secondary enrichment has certainly been an important factor in producing such extremely rich superficial films.

It may have been an important factor throughout the entire horizon which is at present being mined. How important a factor it is, it is yet too early to say; but the results adduced, partly from scientific boring, and partly from studying the genesis of the ore, give a rational explanation of the methods of exploration which have been empirically worked out within the Cobalt district.

STATISTICS AND RETURNS

Cobalt shipments for the week ending March 2nd, 1907:—Nipissing shipped 148,470 lbs. to New York. O'Brien shipped 65,500 lbs. to Perth Amboy, N.Y.; 64,630 lbs. to Copper Cliff; 64,480 lbs. to Perth Amboy, N.Y. La Rose shipped 57,480 lbs. to New York. Silver Queen shipped 54,670 lbs. to Copper Cliff. Buffalo shipped 60,000 lbs. to Perth Amboy. Green-Meehan shipped 63,380 lbs. to Copper Cliff.

Mineral production of Ontario for 1906:—

Metallic: Gold, 3,519 ounces, valued at $59,274; silver, 5,357,830 ounces, $3,543,089; cobalt,312 tons, $30,819; nickel, 10,932 tons, $3,836,419; copper, 5,940 tons, $998,548; lead, $93,500; iron ore, 128,099 tons, $301,032; pig iron, 275,558, $4,554,247; zinc ore, 400, $6,000; total, $13,422,928.

Less the value of Ontario iron ore smelted into pig iron (101,569 tons), $243,766. Net metallic production, $13,179,162.

Non-metallic:—Arsenic, 1,298 tons; brick, common, number, 300,000,000, $2,157,000; tile drain, number, 17,700,000, $252,500; brick, pressed, number, 39,860,000, $337,795; brick, paving, number, 3,000,000, $45,000; building and crushed stone, $660,000; calcium carbide, 2,626 tons, $162,780; Portland cement, 1,698,815 barrels, $2,381,014; cement, natural rock, 8,453 barrels, $6,000; corundum, 2,914 tons, $262,448; feldspar, 20,373 tons, $43,849; graphite, 1,772 tons, $15,000; gypsum, 3,265 tons, $6,605; iron pyrites, 11,095 tons, $40,583; lime, 2,885,000 bushels, $496,785; mica, 355 tons, $69,041; natural gas, $533,446; peat fuel, 300 tons, $900; petroleum, 19,928,322 imperial gallons, $761,546; pottery, $65,000; quartz, 3,856 tons, $3,586; salt, 50,414 tons, $367,738; sewer pipe, $365,000; sodalite, 200 cubic feet, $6,000; talc, 1,235 tons, $3,030. Total non-metallic production, $9,042,646; add net metallic do., $13,179,162; total, $22,221,808.

The total combined production for 1905, which was the previous highest record, was $17,854,296.

The output of the mines of Cobalt during the year was as follows:—Silver, 5,357,830 ounces, valued at $3,543,089; cobalt, 312 tons, $30,819; nickel, 156 tons; arsenic, 1,558 tons. Total value, $3,573,908.

Up to the end of 1906 the Cobalt camp produced 8,016,061 ounces of silver, worth $5,015,479, and 446 tons of cobalt, 245 tons of nickel and 1,919 tons of arsenic, valued at $150,779, $13,467 and $3,596 respectively. The last three constituents bring at present little or no return to the mine owners.

Summary of the minera prolduction of Canada in 1906 (subject to revision):—

Metallic:—Copper, 57,029,231 lbs., valued at $10,994,095; gold (Yukon, $5,600,000; all other, $6,423,932), $12,023,932; iron ore (exports), 74,778 tons, valued at $149,177; *pig iron from Canadian ore, 104,660 tons, valued at $1,724,400; lead, 54,200,000 lbs., valued at $3,066,094; nickel, 21,490,955 lbs., valued at $8,948,834; silver, 8,568,655 ounces, valued at $5,723,097; cobalt, zinc and other metallic products, $350,000. Total metallic, $42,979,629.

Non-Metallic:—Asbestos, short tons, 59,283, valued at $1,970,878; asbestic, short tons, 20,127, valued at $17,230; hromite, short tons, 8,750, valued at $92,100; coal, short tons, 9,916,177, valued at $19,945,032; peat, short tons, 250, valued at $750; corundum, short tons, 2,274, valued at $204,973; feldspar, short tons, 15,873, valued at $38,740; graphite, short tons, 447, valued at 18,780; grindstones, short tons, 5,545, valued at $61,624; gypsum, short tons, 417,755, valued at $591,828; limestone for flux in iron furnaces. short tons, 366,015, valued at $268,632; Manganese ore (exports), short tons, 93, valued at $925; mica (exports), short tons, 913, valued at $581,919; mineral pigments: barytes, short tons, 4,000, valued at $12,000, ochres, short tons, 6,837, valued at $36,955; mineral water, valued at $100,000; natural gas, valued at $528,868; petroleum, barrels, 569,753, valued at $761,760; pyrites, tons, 39,611, valued at $157,438; salt, tons, 76,387, valued at $327,150; talc, toss, 1,234, valued at $3,030.

NEW DISCOVERIES IN NORTHERN QUEBEC.

By J. Obalski, M.E., Director of Mines, Quebec.

(Toronto Meeting Canadian Mining Institute, 1907.)

Since last summer a number of prospectors have been in the field exploring the Chibogomo district, the valley of the Bell river, and the north of Pontiac county. In many cases the parties were formed under the auspices of small syndicates, the expense of travelling in these remote regions being considerable. In consequence of these investigations, rather more is now known concerning the mineral potentialities of these areas, and this knowledge is strongly corroborative of the opinions previously expressed by geologists in charge of reconnaissance surveys. The writer last year personally visited the regions between the Hanicanaw River and Lake Abitibi. Below is summarized the more important discoveries made and the geological features in connection therewith.

In the Chibogomo district some work has been done on the big quartz vein of Portage Island, showing the continuity of the vein at depth and its larger mineralization in the form of chalcopyrite. This development includes a number of open cuts on the vein, covering a distance of about 1,000 feet, and the sinking of a shaft to a depth of 35 feet. From tests made, the value in gold and silver appears to be greater than previously supposed. In the northwest section of McKenzie Bay, new discoveries of asbestos are reported, while northwest of Island Bay a large occurrrence of magnetic iron has been discovered. Some large bodies of pyrrhotite carrying high copper values have, moreover, been found northwest of Lake Dore; assays of specimens of this ore have also yielded as high a return as an ounce to the ton.

Northeast of Lake Assinibastot, and southwest of Chibogomo river, cobalt bloom was recently discovered, but too late in the season for the significance of the find to be ascertained. The discovery, however, is seemingly confirmatory of opinions expressed by Mr. A. P. Low and Mr. J. E. Hardman, regarding the similarity of the geological formations here to that of the Cobalt area. It is probable that the district will be well prospected during the coming summer, and other important discoveries will doubtless be made. Meanwhile a good winter trail is now completed from Lake St. John to Chibogomo.

In the north of Pontiac, the writer has explored from the Baie des Guize following the Ottawa and Kinonge rivers, Lake Kewagama, Lake Askikwaj and northward down the Hanicanaw river 20 miles north of the proposed route of the Transcontinental Railway, and thence to Lake Abitibi, White Fish river, and south to the Baie des Guize. Outcrops of Laurentian gneiss occur south of Askikwaj Lake, north of Kewagama Lake, north of Long Bay of Kinonje river, and south of the height of land on the shore of Lake Opasatica. However, the area south of that line is, of course, not all Laurentian, bands of Huronian being found in several places, as shown in Dr. A. E. Barlow's map of 1899. The country crossed by the Transcontinental Railway is covered by a thick layer of clay, but shows in places outcrops of rocks, undoubtedly of Huronian age.

The northeast shore of Lake Kewagama is Huronian, as is, too, the district around Askikwaj lake. Descending the Hanicanaw river the same rocks outcrop for some distance; but further down the surface is covered by clay, with occasional outcrops of rocks. The exposures of rock down the river for the distance travelled of forty miles, and also along the route of the Transcontinental Railway for twenty-five miles, were very few. Nevertheless, the rock in sight is Huronian, being diorite, serpentine, schist, and a granite similar to that found on the height of land, near Lake Opasatica. It is reported that chalcopyrite has been found on the shore of the Hanicanaw river, below the Transcontinental Line.

In the serpentine above mentioned the writer has observed small stringers of asbestos. On the southern slope of the height of land some molybdenite occurs, and it is reported that another deposit has been found in the big peninsula of the Lake Kewagama. In a more westerly direction, the country is rocky and less difficult to prospect, and no important discoveries have been made, except in the vicinity of Opasatica lake. To the northeast of this lake, not far from the height of land, a very remarkable piece of quartz, showing abundant visible coarse gold, was picked up, and exploration since has apparently resulted in the discovery of gold-bearing quartz in place. Two blocks of land have been purchased from the Quebec Government in that section, of which one by the King of the North Gold Mines Company, recently organized to develop the property. The writer visited the district in July last, and, although he did not see any visible gold in the quartz, he obtained good colors by panning the debris in the vicinity of the deposit.

To the south of Lake Abitibi, and close to the shore, a guide of the party found some rock containing gold, and the fact was ascertained that rock of the same character, also showing gold, was here *in situ*.

Some indications of chalcopyrite have also been found close to the boundary line, not far from the 35th mile.

A number of lots have been prospected in the surveyed townships near Temiskaming lake, and a large variety of minerals found there, including galena, iron pyrites, copper pyrites containing some gold, cobalt bloom, and iron; one undertaking, the Jessie Fraser Mining Company, purchased a block of land in Fabre township, on which a small steam plant has been installed. The geological formation of these townships appears to be a succession of bands of Huronian and Laurentian, not yet accurately determined.

On the Bell river some prospecting has been done, but no new discoveries of importance are reported.

Last season the Geological Survey explored from Lake Abitibi Dr. A. E. Barlow also reports on the geology of the eastern part towards the east, following the surveyed lines of the Transcontinental Railway. Mr. W. J. Wilson gives a summary report of this exploration in the last publication of the Geological Survey. the occurrence here of minerals of economic value.

MINING IN THE YUKON

By Dr. Alfred Thompson, *M.P.*

The Yukon Territory has produced in the last ten years, according to official reports, over 120 millions in gold bullion. By far the greater part of this vast amount came rrom what is known as the Klondyke district, and experts who have examined the gravel deposits and measured the yardage, tell us that there still exists about 100 millions in the gravels in this district alone.

Geologists tell us that a very large portion of the Yukon Territory is auriferous, and a comparison of the Klondyke district with the total area of the Territory would be like a postage stamp on an ordinary envelope.

The outpu per year has gradually fallen from twenty-two millions in 1900 to some six millions in 1906. The reason for this gradual decline is because of the great expense in mining the gold by the methods used.

The methods comprise sinking shafts, driving tunnels, thawing of the ground by wood fires or steam, pumping water, etc., and could be only used profitably on the richest ground. As this rich ground became exhausted the output declined, not because the gold was all taken, but because the method of mining made it impossible to work at a profit the lower grade gravels.
and claims that, under the old regime, were almost valueless, have

During the past year a great change has come over the industry, to-day not only a value but a market. This has been brought about by the introduction of outside capital, in the form of dredges, to mine the valleys, and ditches bringing in water, to mine the hills.

Dredging, although only in its infancy in the Yukon, is assuming the proportions of a vast industry, and in a very few years will send the annual output again up to the twenty million mark.

The modern dredge as used in the Yukon is a work of art, and is the legitimate heir of all the improvements in dredging, with a few specialities for the Yukon. It is self-contained, requires only a small amount of water, is driven by electricity, works night and day, and saves a larger percentage of gold than any other method ever used in the Yukon.

These dredges under the most favorable conditions can wash gravel at a cost of from 12 to 15 cents per cubic yard, and, according to the size and number of digging buckets, will handle from 1,000 to 4,000 cubic yards per day of twenty-four hours.

There are ready for work, or in course of construction, seven dredges within a radius of twelve miles of Dawson. In the spring of 1905 there was only one. If all arrive that are ordered, there will be twenty in the same district in 1908, and this is only the beginning of a great fleet of these gold mining leviathans, which will in a few years be overturning the gravels of the famous Klondyke and its tributaries.

Rock mining for silver and copper is becoming an important industry in the southern end of the Territory, and, as far as it is possible to judge, the future of the Yukon is assured.

THE BRUCE MINES, ONTARIO, 1846-1906

By H. J. Carnegie Williams, Bruce Mines, Ont.

(Toronto Meeting Canadian Mining Institute, March, 1907.)

This history of Bruce Mines may, the writer believes, prove of interest, not only on account of the property's value, but because of its comparative antiquity. It is sixty years ago since the original locator, a Mr. Keating, who was connected with H. B. M. Indian Department, was shown by Indians the copper deposits of Copper Bay and Bruce, the latter being so named in honor of Lord Elgin, one of Canada's distinguished Governor-Generals.

In the meantime the Montreal Mining Company had been formed, and an expedition, in charge of Mr. Forrest Sheppard, left Montreal in May, 1846. Mr. Sheppard selected eighteen tracts or locations, each one containing ten square miles. The price paid was, according to Mr. E. B. Borron, £150, Halifax currency, for each location, and 20 cents an acre. On a re-examination of these properties the directors became dissatisfied, and blamed Mr. Sheppard; although, in fairness to him, it should be stated that one of the locations covered the famous Silver Islet.

By the advice of Captain Roberts the Montreal Company purchased the Bruce Mines location for £40,000, Halifax currency, and concentrated all their efforts in opening up the Bruce section on the Cuthbertson location. In 1848 a small party, under Mr. Harris, examined the location adjoining to the west, and known by the name of Huron Copper Bay, on the Keating location. They appear to have done a little work, sinking a shaft within a hundred yards of Lake Hpron. The lode here is small, but of good quality. They also discovered and reported on two other lodes further inland, one of which has been re-discovered this year; whilst another discovery is attracting a great deal of attention on account of the value of the ore disclosed and the width of the vein. It is curious to note that apparently no attention had been paid to these discoveries since 1848.

Meanwhile, in the fall of 1848, the first engine house was erected and machinery installed. Unfortunately, the severity of the climate was not allowed for in the construction of the building, and, in consequence, frost got in the stonework, and when the machinery was set in motion it collapsed.

In this year the late Sir William Logan made a very exhaustive examination, and reported very favorably on the property. In 1849 the small settlement consisted of 77 miners, 65 laborers, 4 boys, 11 blacksmiths, carpenters and other artisans, 2 mining captains, 1 engineer, 2 clerks, and 1 superintendent, giving a population, including the families of the workmen, of about 250 souls. Cholera caused several deaths and delayed the erection of machinery, so that it was not until the summer of 1850 that any returns could be made.

The fact was early appreciated that the keynote of success was the smelting of the ore on the spot, and with this in mind the president of the company, the late Hon. James Ferrier, brought out from Wales a copper refiner and three furnace men. This first attempt, unfortunately, proved a failure, and the smelting works were destroyed by fire. The slag was, in later years, sorted over and the richer portion shipped to England. Assays made by the writer from materials remaining show over 2 per cent. of copper. Ferrier's name is attached to the deepest shaft on this section of the property. The shaft is presumably three hundred feet in depth only, as a record exists of drifting operations east on the lode, in 1868, at the 50 fathom level. (See Plate I showing width of lode at eastern end.)

The dressing operations seem to have been very crude. Cornish rolls, break staff jigs, and concave buddles appear to have been used. Evidently the crushing was not carried far enough, and it is highly probable that they lost three-fifths of the ore contents. At any rate, the results obtained were so different from the estimates, that in 1851 all the officers resigned or were dismissed. In 1852, Mr. E. B. Borron took charge and introduced the tribute system, the men being paid £5 a ton on ore dressed to 15 per cent. and a bonus, varying in price according to market fluctuations, of seven shillings and sixpence per unit. As the ore was dressed to 20 per cent., this would mean £6 17s. 6d. per ton of 21 cwts. A small dividend was declared in 1853, followed by a larger one in 1854. In the latter year the misfortune occurred of the loss of the company's steamer, with nearly all the materials and machinery required for mining and ore dressing operation during the winter. There being no other means of transportation, it was impossible to replace this equipment until the following summer.

In 1854, Mr. Sampson Vivian, having acquired a lease for fourteen years from the Montreal Mining Company, of the western portion of the property, on a royalty of 5 per cent. on the dressed ore, succeeded in forming a company in England, under the auspices of Messrs. John Taylor & Sons. This concern, which was called the West Canada Mining Company, commenced opening out what is known as the Wellington Section; but soon after a teamster, named George Clark, searching for strayed cattle, found a lode, from which the moss and leaves had been burnt off in a recent bush fire, in consequence known as the Fire Lode, which name it still bears. He was rewarded with a barrel of flour. A shaft was started on this new find, and, in digging a water course, another and a wider lode was encountered. On tracing these to the westward it was found that a junction took place on the adjoining Huron Copper Bay location, and Messrs. Taylor & Sons very wisely secured a lease upon this and eventually purchased the whole location, including the Bruce Mines, from the Montreal Mining Company in 1864. It would appear that the Bruce area produced, up to 1857, 3,239 tons of 2,000 pounds, with an average value of 18 per cent. copper, containing 583.22 tons of fine copper.

The capital of the West Canada Mining Company was £200,000, and the cost of installation and development, with all the then

existing difficulties of transport, were so heavy that it was not until 1861 that the mines commenced to pay dividends. Dressing floors were erected on the Wellington and Huron Copper Bay sections; but the buildings not being enclosed, operations were confined to the summer months, the ore being mined and a large proportion left underground during the winter. The following statistics have been kindly placed at my disposal by Dr. Robert Bell, F.R.S., etc.:—

	Tons (2000 lbs.)		Tons fine copper
1858 Bruce & Wellington produced	1266	of 21.94% copper	=277.76
1859 Bruce & Wellington produced	1803	of 21.35% copper	=384.94
1860 Bruce & Wellington produced & Huron Copper Bay....	2411	of 20.50% copper	=494.25
1861 Bruce produced 555			
1861 Wellington do ... .1381	2421	19.60% copper	=474.51
1861 Huron Copper Bay do.. 485			
	7901		1641.46

In 1862 a disastrous bush fire almost wiped out the entire village. The company sent a subscription of £300 to assist those who suffered most, but the men refused to accept anything, and asked to be allowed to devote the money to form a nucleus for a public school fund, which was permitted.

From 1861 to 1868 an era of prosperity set in. The price of copper was good. At first the concentrates were shipped to England, but afterwards to the United States, until the war broke out; when a tax of five cents per pound was put upon copper, thus closing this market.

The average work done during nine years, according to the evidence given by Mr. William Plummer before the Royal Commission in 1890 was "sinking 87 fathoms, driving 113 fathoms and stoping 1,241 fathoms" per annum. This shows very plainly that the stoping ground opened up must have been very wide, taking into consideration the relatively small amount of the development work; in fact, quoting from the evidence of Mr. Frank Prout before the same Commission, "we generally paid about $35 a fathom, the ordinary width being ten or twelve feet; when wider we paid more." Forty dollars per linear fathom, however, was nearer the average price paid, so presumably the lode was over twelve feet wide.

About 350 men and boys were employed, of whom 200 were underground. The cost of superintendence, wages and materials appears to have averaged $12,000 per month. An extraordinary method of working seems to have been adopted, the price for driving a level on contract being $120, the men finding powder, caps, fuse and candles, also steel sharpening, the company doing the mucking and hoisting. Whilst shaft sinking was $240 and stoping $40, but the men were only allowed to do a limited amount of work, so that their average earnings were $40.25 a month. The dollar was calculated on Halifax currency of $4 to the pound sterling.

During the years 1862-1868 the following shipments were made:—

	Tons	Tons (2000 lbs.)		Tons fine copper
1862 Bruce	446			
Wellington 1501		3154	of 19.65% copper	=619.76
Huron Copper Bay 1207				
1863 Bruce				
Wellington		3719	of 20.00% copper	=743.80
Huron Copper Bay				
1864 Bruce				
Wellington		3457	of 19.48% copper	=673.44
Huron Copper Bay				
1865 Bruce (very little from)				
Wellington		3332	of 21.24% copper	=707.71
Huron Copper Bay				
1866 Bruce (very little from)				
Wellington		4157	of 20.00% copper	=831.40
Huron Copper Bay				
1867 Bruce (very little from)				
Wellington		3224	of 20.00% copper	=644.80
Huron Copper Bay				
1868 Wellington				
Huron Copper Bay		3297	of 20.00% copper	=659.40
		24340		4880.31

In 1868 the visit is recorded of Mr. John Taylor, Jr., who made a very full report upon the property, and the following extract sums up the situation at that time in a few words: First, heavy costs of dressing; second, great losses of copper during the process of concentration; third, heavy freight from the mines to England. He made two important recommendations; the smelting of the ore on the spot, and the reduction of the copper by means of salt and iron, known as the Henderson process.

Presumably, after due deliberation, it was resolved to send out, in 1869, Mr. Charles de Bussy to conduct a series of experiments as to the advantages of the Henderson process; and that these were successful is proved by the company erecting, during the years 1870-1871, a plant at a cost of $200,000 (se Plate II, showing all that remains to-day). From the returns it is evident that operations were conducted on a very limited scale during 1872-1873, and were then discontinued. It is stated that the cost of salt, scrap iron and coal was so heavy that the works could not be operated at a profit, although the extraction appears to have been as nearly perfect as possible. The writer has obtained 0.18 per cent of copper as a maximum from the heaps of waste.

PLATE II.—Old Lixiviation Works, Looking North, Bruce Mines, Ont. The Smoke Stack has since been pulled down.

PLATE III.—Sketch of Lixiviation Works, 1871, Bruce Mines, Ont.

During 1868 a certain amount of activity was shown in trying to make fresh discoveries. A shaft was sunk on the north lode, about one mile north of the bruce section, and sunk 75 feet, but work was stopped, it is stated, because the men objected to walk so far to their work, and the shaft house headgear, etc., was destroyed by fire. Nearly equidistant between the Bruce and Wel-

lington sections the lode was found, and a trial shaft sunk 75 feet, then drifted on for 200 feet in each direction, viz., east and west, and a small stope put in on the west drift. Work was stopped here because it was said to cost too much to cart the ore to the dressing floors, not half a mile away; btu the reason is difficult to understand, as the ore is of good quality, and the writer's assays, taken every six feet, will average over 4 per cent. Probably this was considered too poor in those days.

During the years 1896 to 1875 records show that 47,593 tons, of 2,000 lbs., were shipped, with a copper content of 9,562.96 tons, and sold, according to the best authorities, for $3,300,000. The average copper contents were 20.09

What quality of ore was mined must be a matter of conjecture, but it is known that the late owners of the property sold 50,000 tons of tailings, or, as they are locally called, "skimpings," an dthe writer has measured 117,000 tons remaining on the property, whilst a quantity has been washed into the lake, and the Canadian Pacific Railway ballasted their line from here to Sault Ste. Marie, a distance of 36 miles, from the same source. It may fairly be assumed that 400,000 tons of rock were mined, of which 100,000 remain as waste on the dumps, and 300,000 tons probably can be shown as having been treated. With the exception of sinking Bray's or No. 2 Shaft to 420 feet, all this tonnage was won from above the 360 foot level.

If the average value of the ore, after deducting the waste, was four and a half per cent., it should have yielded 13,500 tons of copper, but as only 9,852 tons of copper are shown to have been shipped, it is evident that a loss of 41 per cent. was made in the treatment. Of course, this is merely an hypothesis, but is remarkably close to the estimates of both Messrs. Borron and Plummer, who compute a 40 per cent. loss. It will be noted that there are three epochs of seven years: the first, development; the second, bonanza; the third, gradual diminution for want of development. The debacle came in 1875, but after 1872 no developments were carried on, and presumably the costly experiment of the Henderson process so disheartened the proprietors that orders were given to take everything away worth getting out, at a minimum of cost. The result of this policy can be seen in the "Big Cave" (see Plate IV). Here the junction of the two lodes took place, and the ore must have been surprisingly rich, as it is currently—and the writer believes truthfully—reported that they had at one point 24 feet wide of ore. The greater part, konwn as "prill," was simply put in barrels and shipped. It is satisfactory to say that there is considerable evidence to show that this shoot of ore continues downwards, and the present company will benefit thereby. At any rate, the result of this way of working caused the "Big Cave." A party of six men had been working on a stope from, October, 1874, to March, 1875, and, according to measurement, the record of which exists, they had broken 33 fathoms, 1 foot 3 inches (width unknown, but probably 10 to 12 feet). Following the usual custom, the ore was left underground. Signs of what was coming were frequent, so much so that some men left the mine rather than run the risk. Fortunately for everybody, "the cave" occurred on a Saturday night, so no lives were lost, and the stope, not having been carried below the fifty fathom level, the sixty fathom level remained intact, the only loss being the ore accumulated as above stated. This was virtually the finish, although small parties of tributers worked during 1876. The mine was then closed down for its long sleep until 1898.

The property was in that year secured by some English capitalists, who, after unwatering the shafts, had an examination made by the celebrated mining engineer, Dr. Hatch. The result of this report was so satisfactory, in spite of the fact as above stated, that for three years the mine was literally robbed, that a company was formed in England and work resumed. Unfortunately, like so many other similar enterprises, the cart was put before the horse, a concentrating mill being erected to treat 400 tons a day, whilst underground development was not undertaken on an adequate scale. They, however, succeeded in proving that the lode is no less than 18 feet wide and over 3 per cent. in value, and this at a depth of 420 feet. Then a fire occurred, burning down the newly erected pit head gear, shaft house, with crusher and ore bin, blacksmith's shop, men's dry, power and boiler house, etc. This, naturally, was discouraging, and, occurring as it did during the South African war, the principal shareholders, who were greatly interested in the gold mines of the Transvaal, called the general manager to England, and, not being

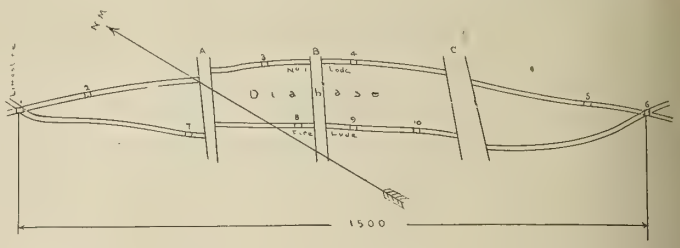
Plate IV.—No. 1 Lode. No. 2, or Fire Lode. East End of Big Cave, Bruce Mines, Ont.

satisfied that an output of 400 tons a day could be guaranteed, determined to stop all operations except those necessary to keep the mine dry. Even this they eventually stopped on April 23rd, 1904, and in March, 1905, the writer was commissioned to pump out and make an examination. This was done, and, the report being satisfactory, a company was registered in Ontario, but with English capital, and Wellington and Huron Copper Bay sections have been again unwatered.

The property held by the company consists of the entire mineral

rights over the old original grant of twenty square miles, but only 655 acres of surface rights remain of the former 12,800, of which about 300 form part of the town of Bruce and consist of valuable town sites, docks and water rights. In addition to the 400 ton concentrating mill, there is all the plant and machinery necessary for the mine's development in full working order.

The copper ores, chiefly chalcopyritic, which are found in such abundance, apparently are distributed in well-defined bodies or zones, but, taking into consideration the wide area over which discoveries have been made in this section of the country, and recognizing that these are only a fraction of the whole, it is impossible to deal with this subject within the limits of this paper. Suffice it to say that hardly a township exists without one or more ore bodies, and that it might fairly be stated that in the more settled parts there is hardly a farmer but has some indications of mineral wealth on his property; and it is evident that whatever treatment or process may be generally adopted in the future, it should be one that would enable the smallest as well as the largest producer to participate in, and thus aid in the gradual development of what must prove an immense addition to the mineral wealth of the country. In fact, the company is being constantly urged to erect a smelter sufficiently large to serve the general public in addition to its own requirement, and this should prove a great boon to those in the locality on whose properties are showings of copper.



Geology.

The geological sequences from Lake Huron through the Bruce Mines to the north are diabase in the lower slate conglomerate, encircled by dolomitic limestone and followed by the upper slate conglomerate, red quartzite, red jasper conglomerate, with white quartzite forming an anticline, of which the white quartzite is the apex. The lodes have an average strike of 25 degrees W of N., and dip, as a rule, almost vertically to the S.W., until the summit of the anticline is passed, when the dip, if any, is reversed, although there are ore bodies found with an E. and W. strike and dipping S.W. These occur in the upper conglomerate, and appear to be true fissures. All these rocks belong to the Huronian series.

Ore Occurrence.

We have to deal with three classes of ore occurrence. First, in the quartizite, specular iron is often associated with the chalcopyrite, and in places chalcosite is found on the surface. This, on weathering, assumes the appearance of iron, so that the prospector should be warned of the resemblance. The siliceous ores are often accompanied by veins of calcite. Secondly, the fissure veins of the upper conglomerate. Although these were known in the earliest days, they appear to have been disregarded until recently, when a most important discovery was made on this property, and a most interesting one from a mineralogical point of view, as a collection of copper ores might be made from it, both black (melaconite) and red (cuprite) oxides, the latter followed by native copper in leaflets, besides the ordinary bornite, chalcosite and chalcopyrite, with apparently a little pyrrhotite. These can be seen *in situ*, not vertically, as might be expected, but horizontally, the native copper being to the south and followed by the other ores. The only other instance of this order of deposition known to the writer is found at the Spassky Copper Mines in Siberia, where solid chalcosite forms one wall with ore diminishing gradually in value over a width of thirty feet, where it carries only two per cent. As the gangue of these ores carries considerable lime, they would furnish suitable fluxes for the siliceous ores. The third series are the lodes formed in the diabase. A peculiar characteristic of these is that the larger deposits of quartz are found on the sides of what are to-day merely rounded knolls protruding above the ordinary ground level. In many cases glacial action has sheared the crown off, so that almost flat tables are formed, and then the numerous reticulated veinlets are very clearly seen crossing in every direction. (See Plate IV.) At times the larger ore bodies cross one another and form important junctions, although continuing a serpentinous course with little or no alteration of their mineral contents, and yet preserving their average strike.

A typical plan of this occurrence can oe seen on the Wellington

and Huron Copper Bay sections, now being worked by the Copper Mining & Smelting Company of Ontario, Limited.

A. Aphanitic Dyke, 25 feet wide.
B. " 20 "
C. " 40 "
No. 1. Palmer's Shaft, 360 feet deep.
" 2. Bray's or No. 2 Shaft, 450 feet deep.
" 3. Rowe's Shaft, 240 feet deep.
" 4. Mitchell's or No. 3 Shaft, 240 feet deep.
" 5. Scott's or No. 4 Shaft, 340 feet deep.
" 6. Crazie's Shaft, 270 feet deep.
" 7. Unknown. Depth about 75 feet.
" 8. Collin's Shaft, 200 feet deep.
" 9. Gribble's Shaft, 200 feet deep.
" 10. Knight's Shaft, 210 feet deep.

The numerous shafts are relics of the time when hoisting was done by a horse whim.

Dolomitic limestone comes in at the N.W., and the northern portion has not been followed up. That on the south has been explored for 480 feet by an adit parallel to the limestone.

This gigantic horse, 1,500 feet in length, is crossed by three dykes, the material of which differs but slightly from the ordinary country rock. The centre one has not caused any alteration, but the other two are fracture planes, and the entire mass of ground has been forced twenty feet to the north, throwing the lodes accordingly. Whilst at the junction to the west of Palmer's shaft a very rich ore body was found, in parts twenty-four feet wide, to the east, at Crazie's, the junction did not produce anything like such high value, although the quartz is from eight to sixteen feet wide.

The principal ores are chalcopyrite, with a little bornite, and the gangue is highly siliceous. At the surface some very fine deposits of chalcosite were mined, and bornite at the 270 foot and 360 foot levels is again coming in. A typical analysis of poor ore shows:—

Silica	91%
Iron	4.35%
Gold	.01 oz.
Silver	.80 oz.
Copper	2.21%
Lime	.70%
Sulphur	Not stated.

The average run of the mine is three and one-half per cent., whilst the known extent of the lodes is 8,000 feet longitudinally.

Treatment of Ore.

After being crushed to pass a two and one-half inch ring, the ore was fed to 24 inch rolls, from which it was elevated to sizing trommels, the oversize coming back for re-crushing, the finer feeding direct into the jigs. The waste from two series of jigs was again brought back for crushing, whilst the finer stuff went into spitzkasten and fed on to six foot Frue vanners, the waste from the second series of jigs being taken to a six foot Bryan mill and a 30 inch fine crushing roll. The resultant product was lifted by bucket elevators and fed to Linkenbach double-deck tables, 16 feet in diameter. Eventually these finer slimes were put

over another series of Frue vanners. This process of fine crushing appears somewhat complicated, but the idea was to crush very fine to make a high concentrate. They succeeded in obtaining 25.15 per cent., whilst the tailings went 0.53 per cent. (See Plate VII. of mill.)

Having obtained the concentrates, it was necessary to find a market for them, and this meant heavy freight and smelter charges. Therefore it is quite apparent that if blister copper could be produced the bulk of the ore, not only of this property but of the neighborhood, could be cheaply smelted, as they do not contain anything deleterious in the shape of zinc, arsenic, etc.

In order to do this a customs smelter should be built, so that the siliceous ores of our property might be mixed with the ores containing lime and iron, to form a suitable mixture for economic smelting. The district is traversed by the Canadian Pacific Railway from Sudbury to Sault Ste. Marie, and bounded on the south by Lake Huron. Freight on coke and coal from the United States is low, and if it is settled that coal for coking purposes can be introduced free of the present duty of 53 cents per ton of 2,000 pounds, another industry would be added to the national wealth. In the event of the Provincial Government granting a bonus on refined copper, capital might be induced to erect a refinery, this, indeed, being the programme which the Copper Mining & Smelting Company of Ontario have seriously considered. The Governments, both Dominion and Provincial, have voted subsidies to the Bruce Mines & Algoma Railway, which traverses the property from south to north, and this, if pushed on to the C. P. R. main line at Chapleau, and thence on to the Grand Trunk Railway, now in course of construction, would open out great wealth in timber and mineral, and tap the great Clay Belt. But nothing is being done. Aid to improve existing roads and make new ones would be highly beneficial, as the writer is of the opinion that the solution of the whole problem of making copper mining a great success may be found in the erection of local smelters.

Having thus brought the history of Bruce Mines up to the present date, it may be stated in conclusion that since the first Exhibition in Hyde Park, London, England, 1851, to the St. Louis Exhibition in 1904, exhibits from these mines have gained medals for the display of ore, etc.

The high price of copper must have been a great inducement for the first owners of the property, as the following will show:—

	Per ton
1853	£136-16-0
1854	£140- 2-0
1855	£141-10-0
1858	£140- 0-0

To-day the market price is £102 per ton. Is it possible that we are again approaching a period of high prices, when the present company, with modern appliances and easy transportation, will reap greater benefits than were ever derived by former shareholders at the highest point of their prosperity.

PLATE VII.—East End of 400-ton Mill. The Copper Mining & Smelting Company of Ontario, Limited, Bruce Mines, 1906.

The writer has purposely not dwelt at length on the geological features of the area, as the report now in course of preparation by Messrs. Ingall and Denis, of the staff of the Geological Survey of Canada, embodying, as it does, the work of two years in this neighborhood, will, when published by the Department (a preliminary report having already appeared in 1904*), afford a far more complete generalization than can here be attempted.

By a series of careful experiments it has been established that the corrosion of iron is not caused by the presence of carbon dioxide in the atmosphere, but by oxygen in conjunction with water. While carbon dioxide is not essential, it may accelerate the reaction.

The amphibale group of minerals are of similar composition to the pyroxenes. Trimolite, actinolite and hornblende are the chief members of this group. The fibrous minerals, asbestos and amianthus, are varieties of trimolite and actinolite. Hornblende forms a rock by itself and is an essential constituent of diorite, syenite, andesite, gabbro, and many crystalline schists.

GOLD MINING IN NOVA SCOTIA

By Geo. W. Stuart.

I have been asked to express an opinion as to the cause of the decline of gold mining in Nova Scotia.

The question would imply rather an erroneous impression, one not entirely borne out by the facts as established by the Government statistics. Last year, 1906, the yield of gold, by the sworn reports at the mines office, when compiled, will exceed 14,000 ounces. In no less than ten different years during the period since the inception of gold mining in the province (1862), the yield fell below these figures. The returns of 1874 show the minimum yield of 9,140 ounces, and the returns of 1898 show the maximum yield of 31,104 ounces. From 1872 to 1881 there was but little life, energy, or money, put into the business; therefore, with the exception of 1877, when the yield reached 16,882 ounces, the returns were, approximately, but from 9,000 to 13,000 ounces.

In 1881 there was conceived a new hope for the industry, caused by the discovery of a rich lead in the Montague district, known as the "rose lead." This lead was discovered far away from any float or drift, that escaped from it. The discovery was made through scientific conclusions and research, put into execution for the first time in the province. The methods adopted were freely made known to others, and soon other leads of much value were unearthed; among which was the new Caledonia, or DeWolf lead, in Montague, and the Dufferin at Salmon River, both large producers. From this date the yield steadily increased, until, in 1898, it reached the maximum above stated, 31,104 ounces. For the five succeeding years the average yield was 28,500 ounces, but in 1904 it dropped to 14,279 ounces. It will, therefore, be seen, by the above figures, that many times during the 45 years gold mining has been in progress in Nova Scotia it has been at a lower ebb than at the present time; at least less gold was reported to the Mines Office, as obtained.

Presuming that the greater portion of this gold obtained was mined at a profit, some idea may be formed of the great difference in the thicknesses of the veins it has been taken from, when we find by the tonnage returns so vast a difference in yield per ton. For instance, in 1865, 24.423 tons of ore yielded 25,454 ounces of gold—more than $20 per ton. In 1882, 12,081 tons yielded 14,107 ounces, an average of $23 per ton, while in 1902, 192,076 tons yielded but 28,279 ounces, only an average of about $3 per ton of ore. It is not to be inferred, however, that the $3 ore may not have been mined at a profit, or that the $23 ore was mined at exceedingly great profit; but it is a reasonable conclusion that the initial expense for plant and appliances to mine large quantities of low grade ore, at a profit, is much greater than that of a plant to mine and mill small veins of rich ore.

Since 1882 the average yield of gold per ton of ore mined and milled has gradually—with some fluctuations—been lowering, until to-day the average is about $5 per ton. The leads, however, now being worked are, in the main, much larger than the average in the earlier years of gold mining, and, I believe, though under adverse circumstances, to which I will shortly refer, all the mines now working for profit—and not simply doing development work—are succeeding.

Why the presumed decline? is the question I am asked. My answer is that there is a combination of causes and circumstances for the present unsatisfactory condition of gold mining in the province, none of which are the causes generally assigned by those of the outside world who are not in a position to know all the facts. Some, at least, of the causes I am about to refer to, could have been, and should have been, avoided, and some can be remedied yet, if those in power would take the slightest interest in the welfare of this industry.

Cause 1.—In the early years of gold mining in the province—up to the eighties—Nova Scotia miners were in plenty, at most reasonable wages; later, many of these men—some of the best of them—went West, where they obtained much higher pay; and later, after the great mining boom started in our Western country, our miners practically deserted us, until, during the last eight or ten years, the greatest difficulty has been experienced in getting and keeping experienced men to operate our gold mines. Nova Scotia miners, when opportunities are afforded them, are recognized throughout this continent as being rather a superior class of workmen, and therefore they have been able to obtain wages abroad that the operators of mines here felt they could not afford to pay; therefore it has been constantly necessary to employ green men, and the experience has been that too many of them, as soon as a reasonable knowledge of the business is acquired, take flight to the regions where there is more boom and more excitement, and, as they believe, greater opportunities. Thus, mine operators are often left with their mines less than half manned.

Cause 2.—The excessive cost of fuel for power has played a most serious and paralyzing part in the cause; perhaps the greatest in the catalogue. Our mines are largely on the sea coast, mostly of easy access to shipping. Throughout all the early years of mining, and up to the taking over, under new leases from the Government, the large aggregation of coal mines in Cape Breton by the Dominion Coal Company, we were able to buy coal delivered at our wharves at a cost of from $1.75 to $2.75 per ton. Since the advent of this Dominion Coal Company into this country the price of coal in Nova Scotia has been nearly doubled in cost to us. This is a most serious drawback, and is the chief cause for the closing of a number of mines. Particularly has this been the case in the operation of low grade ores, on which the prosperity of the industry must depend in the future. This cause could have, and should have, been provided against by the Government when granting new coal leases to this powerful company.

It has been found, too, that in some of the more inland districts, where wood for fuel has to be used, and is fairly abundant, the large timber limit owners, who have acquired boundless areas at the nominal cost of forty cents an acre—surveys paid for by the Government—have put on practically prohibitory prices for wood, though only fit for fuel, and of no use for milling purposes. Thus the fuel question is the most serious one for all the districts.

Cause 3.—Large blocks of valuable areas are held in many of the districts by men who are, in some cases, mere speculators, and by others who are of the dog-in-the-manger type. These idle sections are entirely apart from those referred to, which have been closed down for the causes above mentioned, and this evil can only be remedied by an amended act.

Cause 4.—Much of the gold contained in our ores is coarse and nuggetty, and it has been a well-known fact that gold stealing has been practiced to an extent, in some mines, that necessitated closing them down; and yet, as the law is at present, no man can be convicted of stealing gold unless he is caught in the act. A workman may be found with any quantity of gold on him, or in his possession, but the owner—the man he has stolen it from—cannot prove it is his unless he—the thief—has been seen to take it. In Australia they have a law making it incumbent upon the possessor of unwrought gold to prove how he came in possession of it. This law has worked well, and has done wonders for the preservation of the mine owners, and the stimulation of the industry in that colony—where legislators look after the best interests of those who are legitimately developing its industries. These facts have been clearly shown to the Federal Government of this country, and for the past five years we have, through the Mining Society of this Province, been praying for such a law to protect us, but our appeals have been in vain.

None of the causes above enumerated can be charged to the gold mine owners. There are some causes, however, that lie at their own doors, and one is the indifference there has been exhibited in the gold-saving appliances. We have depended, practically, entirely on free amalgamation in the past, resulting,

beyond any shadow of doubt, in a large percentage of gold being lost, going out over the plates with the tailings, and being ultimately deposited in the lakes and swamps. I may say also that Nova Scotia has not escaped the consequences of reckless, incompetent and dishonest management. Perhaps we have had more than our share of such here.

Chiefly because of the reasons I have enumerated here, Nova Scotians have become discouraged, and capitalists abroad have become suspicious that our mines are not of a permanent character, and that they are too expensive to work.

I do not believe such conclusions are justifiable, and I trust, and believe, the two foreign companies now operating here, one in an eastern district and the other in a western district, will fully demonstrate the error of such conclusions. They have both adopted the modern cyaniding system of saving gold.

I believe there is yet a prosperous future for gold mining in Nova Scotia. We must, however, have faith sufficient to do more underground exploration work, and we must divest ourselves of the too prevalent idea that all pay zones in all lodes crop to the surface sowewhere; operations in the past have practically been confined to lodes discovered by such out-croppings.

We must also take advantage of the numerous water powers now running to waste, and install electric plants that will make us less dependent upon the fuel situation.

Truro, N.S., Feb. 20, 1907.

THE LONG WALL SYSTEM OF COAL MINING

By T. W. Gray, Glace Bay, N. S.

The Emery seam, which lies at a depth of about 160 feet below the Phalen seam in the Glace Bay coal field, is being worked by the Dominion Coal Company at their reserve mines on the long-wall extraction method, for which it is admirably suited. The seam has a good strong roof, which breaks well, and consists of about four feet six inches of clean, hard, bright coal of good quality, very suitable for domestic or steam-raising purposes.

"Long wall" is somewhat of a novelty in Cape Breton, at least in the Glace Bay district, and the native miner, who has been used to board and pillar workings in seams from six to nine feet high, does not take very kindly to the more confined areas of a four foot six inch seam. As a result, the Emery mine at reserve has become more or less of an "old countryman's mine," long wall being almost universal on the other side of the water. Quite a number of continental miners are employed here, particularly Belgians, who are good men for the work, and, after the tortuous and heated workings to which they have been accustomed, they find agreeable conditions in the cool and shallow mines here.

The coal is undercut five feet six inches with a compressed air disc coal-cutting machine, made by the Diamond Coal-Cutter Company, of Wakefield, England. The Coal Company have about half a dozen of these machines.

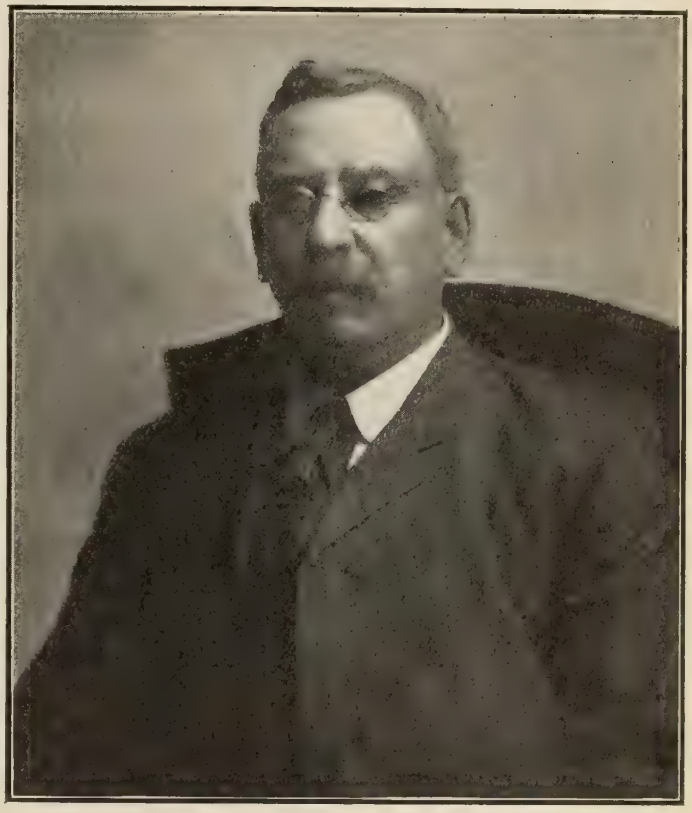
At present there are only two short faces, five hundred and two hundred and fifty feet long respectively, producing about three hundred tons a day, but they are being rapidly extended.

The product of long wall operations is very blocky and strong. It is not powder-shaken, because the roof weight is sufficient to break down the undercut coal with the expenditure of very little or no powder.

A portion of the Phalen seam at No. 6 colliery (Big Glace Bay) is also being worked on the long wall plan, with marked success. There can be no doubt that these are only the beginnings of a more extended use of this method, as the thicker seams, which do not lend themselves to long wall, become exhausted, and the development of long wall work in Cape Breton will be followed with great interest by mining men, as it will involve radical changes in present conditions, both technical and economic.

In England, the use of long wall coal cutters, combined with conveyor belt systems along the face, has rendered it possible to profitably work seams as thin as 16 inches.

T. W. Gray.



Glace Bay, N.S.

INDUSTRIAL PIONEERS OF CANADA

Born in New Glasgow, in 1846, Mr. Fraser showed early in his career a decided leaning towards mechanical work.

As an apprentice he worked for some years at blacksmithing in Providence, R. I.

After marrying Miss Charlotte Dicks, of Pictou, he returned to his native town. His first important work resulted from securing a contract for the iron work of the wooden vessels then being built by Mr. Carmichael.

Graham Fraser.

In 1872, Mr. Fraser, along with Mr. G. F. McKay, established the Hope Iron Works, with a capital of $4,000.

After a year of successful work, a steam hammer was added to their equipment. Then another steam hammer was acquired, and the name of the firm was changed to the Nova Scotia Forge Company. In 1878 the forge works were removed to the present site of the steel works at Trenton, near New Glasgow.

In 1882 Mr. Fraser issued the prospectus of the Nova Scotia Steel & Coal Company, and, until December, 1903, he was the vice-president and managing director of that sound and flourishing enterprise. From that date until January 1st, 1904, he filled the offices of director and director of works for the Dominion Iron & Steel Company, of Sydney, N.S. Mr. Fraser resigned this important position as soon as he had accomplished the task of re-organizing the Steel Company. Since then he has not taken any active part in business.

To Mr. Fraser belongs the credit of having first conceived the idea of establishing a great iron and steel plant at Sydney. Asso-

ciated with Mr. Fraser in much of his work, such men as his brother, Mr. Simon A. Fraser, Mr. Thomas Cantley, and Mr. Harvey Graham, have won prominence.

Mr. Fraser is a most unassuming, pleasant Pictou County Scotchman. Intelligent industry and unswerving integrity have been the keystones of his success.

ROASTING OF THE ARGENTIFEROUS COBALT-NICKEL ARSENIDES OF TEMISKAMING, ONT., CANADA*

Cyril W. Knight.

The Cobalt ores consist essentially of arsenides of cobalt and nickel, together with native silver. In going over the literature on roasting of arsenides, no definite data could be found which gave accurate information regarding the temperature at which arsenic is expelled during roasting operations. A few experiments

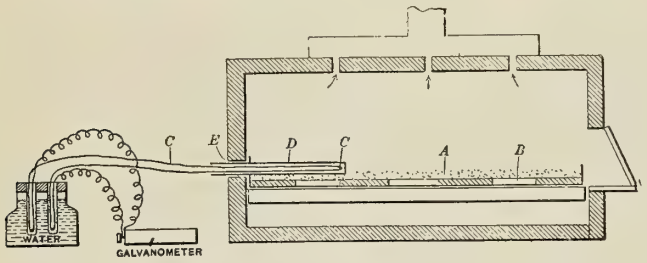


Fig. 1.

were therefore undertaken, with the object of throwing some light on this point; and it was also thought that the metallurgical plants now being erected in Ontario to treat our Cobalt ores, might, perhaps, obtain some information from the work.

The roasting was done in an American Gas Furnace Company's oven, No. 2 (Fig. 1), 27 inches long and 20 inches wide inside.

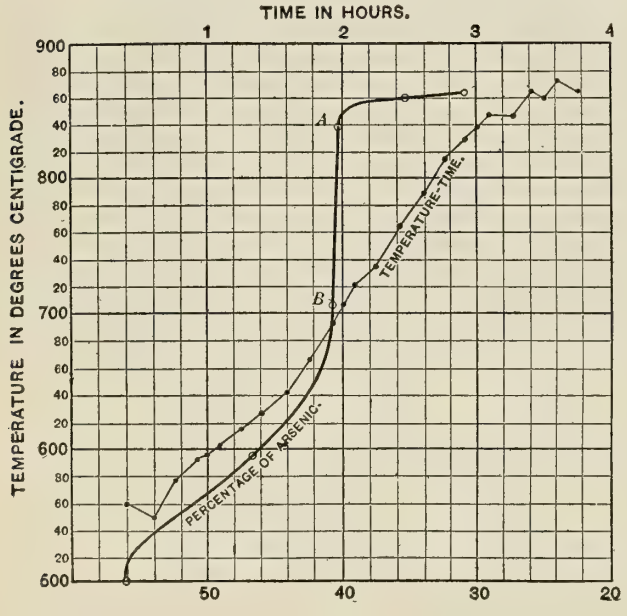

Fig. 2.

The ore was held in iron pans, lined with 0.5 inch fire-brick, B. "The temperature was measured by means of a Le Chatelier pyrometer. The thermo-couple, C, was protected from arsenic and other fumes by a porcelain tube, D, and was placed immediately above the ore, A. It entered through a circular hole, E, in the back of the furance, and was connected with a Keiser and Schmidt galvanometer, standardized by means of the melting-points of zinc, aluminium and copper. The temperature was recorded and the ore rabbed every ten minutes. In none of the roasts was any fritting or clogging of the ore noticed.

The first object was to ascertain the temperature at which the arsenic is most rapidly expelled. The ore treated was ground to pass a 20-mesh sieve. The furnace was gradually heated at the rate of 120 degrees C. per hour to a maximum of 870 degrees C. It was found that, during this roast, 27 per cent. of the total arsenic was expelled below 700 degrees C. That practically no arsenic was expelled between 700 degrees C. and 840 degrees C., but that, on reaching the latter temperature, expulsion again became rapid. This is diagramatically shown in Fig. 2. These results tend to prove that the behavior of smaltite resembles that of pyrite, of which the first atom of sulphur is removed at a much lower temperature than the second.

The second object was to ascertain how thoroughly arsenic can be expelled at 890 degrees C. (a temperature a little above that at which it was found that arsenic is rapidly driven off). The furnace was raised quickly to 890 degrees C., and held near that temperature for four hours. The arsenic content at the end of the roast was about 17 per cent. During the first three hours it fell to 19.3 per cent.; the effect of the last hour of roasting only reduced it to 17 per cent. Fig. 3 gives a curve showing diagramatically the results of the test.

It was found that charcoal, whether added at the beginning or towards the end of the roast, failed to increase the expulsion of the arsenic. In one experiment the ore treated was ground to pass a sieve of 100 meshes to the linear inch. This did not increase the amount of arsenic driven off.

*Summary of a paper published in the Transactions of the American Institute of Mining Engineers, April, 1907, by Henry M. Howe, LL.D., William Campbell, Ph.D., and Cyril W. Knight, B.Sc., respectively professor, instructor and student of metallurgy in the School of Mines of Columbia University, in the city of New York.

ASBESTOS DISCOVERIES IN FOREIGN COUNTRIES

By Fritz Cirkel, Mining Engineer, Montreal.

Those familiar with the asbestos market are aware that the present supply of asbestos is not sufficient to meet the world's demand. This is principally due to the increasing uses and applications of the mineral for industrial purposes. It may be affirmed that the output of all the existing asbestos mines is insufficient to satisfy two-thirds of the demand for this product, and the leading manufacturing firms interested in this industry are diligently searching for new deposits. As a matter of fact, European manufacturers, who find the supply insufficient and irregular, have endeavored to acquire asbestos mines in Canada, but have been confronted with many difficulties, especially in the comparatively small Thetford-Black Lake asbestos area, there being comparatively few productive mines, and these can only be had at exorbitant prices. For this reason, European manufacturers, for the last year or two, have been informing themselves of opportunities in other countries. Thus, Englishmen propose to acquire some recent discoveries in Western Australia, in the vicinity of Perth, where, it is reported, asbestos of quality equal to the Canadian product has been found, although information regarding the location and extent of the deposits is being kept a close secret.

We hear also that renewed attention is being paid to the Ural (Russian) deposits, but whether they ever will assume the importance of the Canadian mines remains to be seen. Two deposits of asbestos were discovered last summer on the Ural, one in the Verchotursky and the other in the Ekaterinbourg districts of the Province of Perm. In the first named district prospecting is carried on by a mining engineer, Mr. A. L. Simchowitch, in a locality called Znamenskaia Datcha. By order of the chief administrator of the Ural mines, the above area was declared free for exploration, and the right to prospect was granted to Mr. Simchowitch for a period of five years.

These asbestos deposits were discovered quite accidentally last

spring, and are located in the very midst of a village, near to some chemical works.

Asbestos mines on the Ural have been in operation for years, and, from the statistics available, the production is steadily increasing. Particularly well regulated is the asbestos manufacture at the asbestos mines at Korevo, thirty versts from Bajenovo Station on the Perm Railway. The entire district is covered with heavy drift material, containing auriferous sand and precious stones, such as emerald, amethyst, topaz, spinel, beryl, etc.; in fact some of the best emerald mines are situated in this district. The country is moderately flat. It is densely timbered, and for this reason prospecting is a difficult task. The formation is a weathered serpentine, much decomposed, and evidently has undergone many disturbances. The asbestos is found in cracks or fissures, similar to the slickensides in Thetford and Black Lake, and is, to some extent, discolored. It is of a fine and silky texture a true asbestos, a form of fibred tremolite and hornblende, and its principal value for manufacturers lies in its tensile strength.

It is not, however, as silky as the Canadian chrysotile. The fibre is a little coarser, of slightly yellow color, and is well adapted for spinning purposes. Most of the asbestos is short, fibre of two and two and a half inches in length being very rare. Two companies are working in the district, the "Poklewsky Kosell" and the "Korrewo Company." The former is the largest company in the district, and employed at one time 5,000 men. But the drawbacks for a healthy and steady progress of the industry are great, the principal ones being the shortness of the season, which lasts only six to eight weeks, and the remoteness of the district.

The mines are remarkable for the fact that, even with a production of 1,500 to 1,700 tons of asbestos per season, the mining work is all done without the aid of machinery or explosives. The ground carries more asbestos to a given area than the Canadian mines, but the veins are not so thick, nor is the color very white. Mining operations are carried on upon a very antiquated system, while a proper milling plant does not exist. Experiments in milling are, however, in progress, and are vivid reminders of what occurred at the Quebec mines years ago. The working force at these mines numbers, as a rule, up to 1,700 men in the season, and is recruited from the Russian Muzhiks or peasants. The wages paid ordinary labor are about thirty-three to thirty-eight cents a day, with free sleeping quarters. These mines, as a rule, suffer from a scarcity of labor during the harvesting time. Adjacent lakes will prevent them from ever attaining the depths of our mines, owing to the very porous and disturbed nature of the rock, the lakes being on nearly the same level as the mines.

MINING POSSIBILITIES IN THE PROVINCE OF QUEBEC

(By Fritz Cirkel, M.E., Montreal.)

(Toronto Meeting Canadian Mining Institute, 1907.)

The establishment of a mining industry in the Province of Quebec is of long standing, and it were, therefore, reasonable to expect that mineral production from this Province should be proportionately considerable. But this is not the case. In 1905 the total value of the minerals produced amounted only to $3.750,-000, an insignificant aggregate in relation to the importance and the varied mineral resources of the area. The question arises, to what cause is this unsatisfactory state of affairs attributable?

The public as a rule finds ready explanation in blaming government for slow industrial progress; but in the present instance this can not be done in fairness. Enquiring into conditions connected with the Quebec mining industry, we find that the Provincial Government has done much to promote mining, and the laws governing the latter are as liberal as can be found in any other mining country, where conditions are similar; and we must, therefore, look elsewhere for reasons.

Meanwhile, if we examine statistics published annually by the Quebec Government, we will observe that the precious metals are absent from the list, and the entire production, practically, is that of minerals not classed as precious.

Thus we have, among others, mentioned:

Iron ore, with gross value of production of		...	$ 35,268
Chromic iron	"	" ...	104,565
Copper ore	"	" ...	128,850
Asbestos	"	" ...	1,476,450
Asbestic	"	" ...	31,100
Mica	"	" ...	95,460

Considering the mineral potentialities of the Province of Quebec, this showing is most inadequate, and the reason thereof is solely attributable to the indifference of the public. Nowadays fabulously rich finds in other provinces of the Dominion have attracted wide attention, and it is not difficult to find capital for the exploitation of precious mineral deposits of even questionable value. But it is difficult to interest investors in deposits of base minerals in this Province promising safe and fair returns on money invested. This point might be illustrated by numerous examples which have come under the writer's notice. But reference need only be made to the absence of interest in our magnetic iron resources by way of demonstration.

It is well known that the Province of Quebec is very rich in iron ores, especially in magnetic iron; these deposits are distributed along the banks of the St. Lawrence, Ottawa and Gatineau Rivers, and are of good quality, quite equal to the Swedish ores.

The magnetic sand deposits on the north shore of the St. Lawrence were discovered over forty years ago, but remain still undeveloped. These deposits are of considerable magnitude at certain points, such as at Moisic, Mingan, Betsiamits, Natashquan, Kagashka.

The magnetic sand is found almost on the surface in stratified beds from one-half inch to six inches thick, but sometimes attaining a thickness of from one and one-half to two feet. These deposits extend over large surfaces on the coast, in some instances for several leagues. Besides magnetic iron, this sand contains quartz, red garnet and titanic iron.

But the principal magnetic iron ores are located in the Township of Pontiac and in Hull, north of Ottawa. In each of these localities, mining operations were carried on some thirty or forty years ago; but work was discontinued, not on account of a falling off in the quality or quantity of ore, but in consequence of loss in handling. Separation methods for the purpose of freeing the iron ore from the gangue are of comparatively recent date; and by these means mines which formerly could not be profitably operated can now be made to pay handsome returns. Most people, acquainted with the early operations of these mines, when approached for an opinion regarding their present value, refer to former failures and express an unfavorable view, forgetting that conditions now have greatly changed for the better, and that these former failures were ascribable to the one cause already

explained. In proof of this contention the mines of the Adirondack region may be instancer.

There has ever been a disposition to under-estimate the great importance of the magnetic iron ores of the Ottawa and Pontiac counties, the specific objection raised against the availability of the ores in that region being that the cost of fuel to smelt the ore is prohibitive. With the steadily decreasing quantity of coal required per unit of finished product, due to the better utilization of fuel by modern methods, this objection is, however, of lessening importance, while on the other hand we have these favorable factors: The ores are rich, the bodies are large, and cheaply mined, for little timbering or pumping is necessary. The objection is occasionally raised that magnetic ores are not as readily reduced in the furnace as hematites, and are, therefore, not worth as much to the smelter. In a general way this is true, although one fact deserves consideration, and that is that magnetites are practically free from moisture, so that their carriage is proportionately less. It is estimated by one of the leading furnacemen in the country, that magnetite involves an extra expenditure in smelting of about twenty-five cents per ton of pig, and even that is only a general statement, since there is considerable difference in the ease with which different magnetites are reduced in the furnace. An interesting practice bearing on this point has been developed at the Wharton furnaces, where New Jersey magnetites are roasted in kilns fired with waste furnace gas, or with producer gas, before being charged into the furnace, a practice for which important economics are claimed.

Another feature which speaks greatly in favor of cheap reduction is the enormous amount of available water power in the vicinity of the mines, which could be readily used for the production of electric energy in electric smelting, as suggested by Dr. Haanel, Dominion Superintendent of Mines; and reference may be here made to the Chats Falls, on the Ottawa River, near the Bristol Mines, and to the Chelsea Falls, on the Gatineau River, in the vicinity of the Ironsides Mines, where more than 50,000 horse-power can be cheaply produced for general mining and smelting purposes.

Referring to the concentration of these iron ores, which are to a great extent of low grade, it should be stated that the Port Henri mines in the Adirondacks, where conditions are similar to those obtaining in the Ottawa and Pontiac counties, have successfully adopted separation processes.

For years the concentration of low grade ores by some form of electro-magnetic separator has attracted the interest of the miner and inventor alike. Among the first to test and develop processes of magnetic separation in the Adirondacks were Witherbee, Sherman & Company, who were called upon to meet two sets of conditions. The New Bed and Harmony ores, low in phosphorus and varying in purity from 40 to 69 per cent. iron, form one group, while Old Bed ores, practically of uniform grade at 60 per cent. iron, but high in phosphorus—1.35 to 2.25 per cent.—form the second group. The magnetic separation, or rather purification, of the latter is particularly interesting and unique, the problem being to eliminate the apatite or phosphorus-bearing gangue, which is practically non-magnetic. The apatite varies in color and in the size of crystals. These two characteristics have a bearing upon the degree of concentration possible. In the case of the apatite of a deep red color the magnetic characteristics are sufficient to carry at times an appreciable percentage of the free crystals into the iron concentrates. Then, too, these deep red crystals adhere more tenaciously to the crystals of magnetite than the green or yellow varieties. The yellow apatite crystals break away most freely from the magnetite. When the magnetite is a shot ore, or of large crystalline structure, it is not difficult to bring the ore into a condition admitting of practical concentration. When the ore is massive, or the crystals of magnetite and apatite are both small and finely disseminated throughout the mass, finer crushing is necessary for the same degree of concentration.

In order to meet these conditions of the ore, it has been found necessary to carefully prepare the ore by crushing, drying and sizing before treating it on the magnetic separators. Aside from this treatment for physical peculiarities of the ores, a rough cobbing is made at the pit head, the first-grade product being sent direct to the furnaces and the second-grade ores being sent to the separators, except at such times when the whole run of mine is concentrated.

To make the Old Bed high phosphorus ores of more value to the blast furnaces, Witherbee, Sherman & Company built a separating plant about two years ago, and later erected another mill, to care for the total output of this grade of ore. During the two years of operation of the plants the methods of treatment have been improved from time to time to assure uniformity of product. While from the start the process has been a commercial success, the improvements introduced have tended to lower the percentage of phosphorus. It is very doubtful if a true Bessemer product can ever be made from Old Bed ores, yet the limits of variation in the phosphorus of the concentrates are being narrowed.

The separating plant is divided into three main sections, the crushing plant, the separating plant and the re-treating plant. Each of these product divisions is also made a power division, a motor being so placed as to control the machinery and conveyors in each division without reference to the others. In the original plant direct current motors are in use; in the second plant alternating current is the motive power. Between each division there are interposed bins, which, through their storage capacity, make it possible to operate each section individually for about two hours without obtaining fresh supplies from the preceding section.

Crushing Division.—The crude ore is first crushed in a 30x18.inch Blake crusher, operating at a speed of 250 revolutions, to 1.50 to 2 inch cubes. The resulting product is then passed over a screen of 0.75 inch opening, the oversize being crushed to 0.75 inch cubes in a Blake 36 x 6 inch double jaw crusher, running at 225 revolutions. The material passing through the screen and the crushed product unite, and are again screened over a six-mesh screen, the ruling size of the mill. The oversize is crushed in a set of 36 x 14 inch Reliance rolls, of Allis-Chalmers make, running 100 revolutions. The troughs of the screens and the product of the rolls unite, and the combined materials are passed through a dryer.

The dryer is a square vertical stack, with baffle bars placed at right angles to one another in alternate sections, there being eight sections with six rows of bars to a section, and six bars to a row. In falling over these bars the body of ore is broken up and permits a free circulation of hot air throughout the mass. The ore being fed in at the top of the dryer, passes constantly into a hotter zone, the heated gases from the grate passing from bottom to top of the stack. On discharging at the bottom of the dryer the ore is elevated to a tower screen, having 288 square feet of screening surface. This screen is divided into equal sections of 30, 16, 10 and 6 mesh screens. The product of each size screen is delivered to a separate pocket in a bin. The oversize of the screens is returned to a set of 36 x 14 inch Reliance rolls, so placed that the product of the rolls meets the original stream from the dryer. By this arrangement material is confined to a closed circut, the only outlet being through the screens. The finest screens of the series are placed at the top, in order that the coarser particles may scrub the fine material through and cause a more effective sizing.

The object sought by frequent screening is the elimination at each stage of the coarse ore, thus preventing pulverization. That the process amply pays is shown in the fact that of the total shipping product about 65 per cent. consists of particles larger than ten mesh—an ideal ore for blast furnace use, as has been fully demonstrated during the past two years.

Separating Division.—Under each pocket of the bin is placed a Rowand Type F magnetic separator, treating one size ore. Ball & Norton separators have lately been introduced on the 30 and

16 mesh sizes. These separators operate in conjunction with the Rowand machines. Both makes of separators are so arranged as to make heads and tails. The heads, or concentrates, are sent direct to the shipping bin, and the tails, containing iron, apatite, hornblende, and a small quantity of silica rock, are re-treated.

Re-treating Division.—The tails from the Rowand Type F and Ball & Norton separators are passed over a screening surface of 72 square feet, equally divided into 20 and 16 mesh sizes. The oversize is passed to a Wenstrom magnetic separator, where the free iron remaining in the tails of the previous separation is recovered, the Wenstrom tails being returned to the 20 and 16 mesh screens after having been re-crushed in a set of 36 x 14 inch Reliance rolls. The product of the rolls meets the original stream from the Rowand Type F and Ball & Norton separators. As in the previous instance, the tails for re-treatment are in a closed circuit and must pass through the screens or over the Wenstrom separator. That portion which has passed through the screens is then treated upon two Wetherill Type E separators. The iron is first removed and is passed into the iron concentrates, along with the concentrates from the Wenstrom separator mentioned above. The hornblende forms a middlings product from these separators, and is passed off as mill tails. The apatite and silica being non-magnetic, form the tails of the separator and are classed as apatite concentrates, carrying from 60 to 65 per cent. bone phosphate. The mill tails carry sufficient apatite to raise the percentage of bone phosphate to from 40 to 45 per cent., and form a second or low grade apatite concentrate.

The concentration operation thus produces three products of market value, iron concentrates, apatite concentrates, and second-grade apatite concentrates.

The mills are each capable of treating 800 tons of crude Old Bed ore in 20 hours. Of the crude material 85 per cent. is recovered as iron concentrates, the 15 per cent. of tailings being equally divided between the first and second-grade apatite concentrates. On a basis of 800 tons of crude ore the products would be as follows:—

	Tons.
Crude ore	800
Iron concentrates	680
First-grade apatite concentrates	60
Second-grade apatite concentrate	60

The average analyses for the past ten months are as follows:—

	Iron	Per cent. Phosphorus	Bone Phosphate
High phosphorus Old Bed crude ore	59.59	1.74	.....
Old Bed concentrates	67.34	0.675	.....
First-grade apatite concentrates	3.55	12.71	63.55
Second-grade apatite concentrates	12.14	8.06	40.30

The other elements of Old Bed concentrates are:—

	Per cent.
Silica	2.20
Manganese	0.08
Alumina	0.90
Lime	3.84
Magnesia	0.31
Sulphur	trace

These mills are also capable of treating 600 tons of Harmony and New Bed crude ore in 20 hours. Of the product 77 per cent., or 462 tons, are recovered as concentrates, the remaining 23 per cent., or 138 tons, being discharged as tailings. These tailings are used for granolithic and concrete purposes, railroad ballasting and marble facing and cutting, the sharp edges of each particle being a far superior medium than water washed sands, where the edges have been destroyed by the action of the water.

Analyses of Harmony cencentrates, from October 2 to November 13, 1903, gave the following results:—

	Per cent Iron	Phosphorus
Lean Harmony crude ore	50.26	0.295
Harmony concentrates	64.10	0.133
Harmony tailings	13.97	0.877

From the above general description of the Port Henry Mines it will be seen that most of the successes are to the eleborate system of concentration and mine equipment, and that the initial difficulties which had to be overcome in preparing the lean ore for the market are similar to those confronting us in Canada. No attempt has yet been made in this country to concentrate our magnetic iron ores on an economic scale, although the deposits contain very large quantities of lean ore accompanying the rich streaks. It is impossible to make these mines pay by simply cobbing the ore, as was done years ago, but if capital were to undertake in earnest the utilization of these resources by the employment of modern methods of concentration, it might expect with assurance a rich reward.

REPORT OF THE ONTARIO BUREAU OF MINES FOR 1906

This fifteenth annual report of the Ontario Bureau of Mines contains much well-arranged, carefully-edited information. Both its appearance and its contents reflect credit upon the Department. It is profusely illustrated, and, typographically very little is left to be desired.

In Part I. a statistical review is followed by Dr. W. L. Goodwin's report upon the Summer Mining Classes, which were conducted in many of the remoter mining camps. About 550 persons received instruction by means of these classes. Nearly all of those attending were given sets of forty specimens. Much appreciation was shown by miners and prospectors.

Mr. E. T. Corkill's report on the Mines of Ontario covers the whole Province. It is edifying to glance over the variety of minerals being profitably mined in Ontario. The whole gamut is run, from gold and silver down through copper, zinc and lead to talc, fluerspar and marble.

Mr. Eugene Coste summarizes the progress of the natural gas and peroleum industries.

"Reports upon Exploration in Mattagami Valley," by Mr. H. L. Kerr; upon the "Agricultural Resources of Mattagami," by Mr. Archibald Henderson, and upon "The Amimikie Iron Range," by Mr. L. P. Getini, are succeeded by Dr. A. P. Coleman's paper on the "Iron Ranges of Eastern Michipicoten." In a note on the Helen Iron Mine, Dr. Coleman mentions an interesting occurrence of yellow ochre, disclosed by draining operations, at the east end of Old Boyer Lake; and shows that this phenomenon, along with the formation of concretionary limonite in shallow water, may be taken as evidence that solution of the ore and subsequent deposition is still going on. This district will evidently respond to detailed investigation. Additional notes on Michipicoten, by Mr. E. S. Moore, close Part I.

In Part II., under the title "Clay and the Clay Industry of Ontario," Mr. M.B. Baker deals exhaustively, clearly and well with a subject which deserves especial attention. Professor Miller, in a short preface, writes thus: "The more stable but more prosaic mineral industries of a country are apt to be somewhat neglected for those which appeal more strongly to men's imagination or cupidity. The clay working industry, which, next to agriculture, can be called the most ancient of industries, has up to the present been almost ignored by scientific workers, although during late years in Germany, the United States, and in other countries, it has been receiving more attention. Several . . . countries now have departments devoted to the study of clay and its products. In Ontario the clay industry has grown rapidly during recent years. Brick, which is cheaper than stone, is being used in modern cities in place of wood for fire protection purposes. As years go on the clay industry must become proportionately more important. It is well, therefore, at this time, for Ontario to have a systematic report, such as that of Mr. Baker's on 'Clay and the Clay Industry.'"

In this we most heartily concur. Space will not permit us to dwell further upon Mr. Baker's report. But it is our intention to take it up in detail at a later date. Meanwhile, we recommend it as a wholesome and appropriate antidote for Cobalt fever.

Some Notes on the Economic Geology of the Skeena River

By W. W. Leach, Ottawa, Ontario.

(Toronto Meeting Canadian Mining Institute, 1907.)
By permission of the Director of the Geological Survey of Canada.

Since the Grand Trunk Pacific scheme was first projected, a great deal of interest has been aroused in the potentialities of the country through which this road will pass. Up to the present, however, the attention of the public has been turned chiefly to the eastern and prairie sections, the uncertainty of the route through the mountainous districts of British Columbia having deterred many from exploring that part of the country in the hope of locating valuable minerals, lands and timber in advance of the railroad.

At the present time it seems fairly definitely settled that the road will pass down at least part of the Skeena valley, and during the past two seasons a number of prospectors have found their way into that district, many coal and mineral claims have been staked, and a great deal of the available arable land taken up.

Although this was one of the first parts of British Columbia to be traversed by the earlier explorers, Sir Alexander Mackenzie having crossed from the Peace River to Bella Coola on the Pacific (passing a short distance south of the Skeena waters) as early as 1793, very little is yet known of the economic geology of the region. The only official reports, known to the writer, dealing with this subject are those by Dr. Dawson, contained in the Report of Progress of the Geological Survey for the years 1879-80, and by Mr. Wm. Fleet Robertson, the British Columbia Provincial Mineralogist (see Report of Minister of Mines, B.C., 1905). Dr. Dawson's work consisted of a hurried exploration from Port Simpson to Edmonton, following the main travelled trails, and with the map accompanying it, affords the only reliable information of much of this country to-day. Mr. Robertson's report, as far as geology is concerned, deals chiefly with a number of prospects in and adjacent to the Bulkley valley.

Up to the last few years little or no prospecting has been done in this great district, if we except the placer miners, who have overrun the greater part of it pretty thoroughly, but without any very startling results.

The rocks of the Skeena River may be roughly grouped into four main divisions, to which, in their southern continuation in the neighborhood of Francois Lake, Dr. Dawson has applied the following nomenclature, beginning at the oldest:—1st, The Cascade Crystalline Series; 2nd, The Cache Creek Group; 3rd, The Porphyrite Group; and, 4th, Rocks of Tertiary Age.

The Cascade Crystalline Series extends in a belt along the coast and is crossed, more or less at right angles, by the river, and has here a width of 50 to 60 miles. These rocks consist chiefly of gneises, granitic rocks and micaceous schists, generally much disturbed and usually found dipping at high angles; they are supposed to be of Palæozoic age, probable carboniferous or older. Up to the present they have not been found to contain many large or valuable mineral deposits, although various minerals of economic value have been reported as occurring in these rocks at different localities in this neighborhood, notably, pyrrhotite and chalcopyrite on the Tshimpsian Peninsula, back of Port Simpson, galena and copper pyrites at the head of Kitamat Arm, and iron ore on the Ecstall River, near Port Essington. It is highly probable, however, that future prospecting will bring to light other occurrences of valuable minerals, as the extremely wet climate of the coast region, with the resultant rank growth of underbrush and heavy covering of moss, has deterred many from prospecting this part of the district with any degree of thoroughness. The mountains here, besides, are high and rugged, with few trails and less feed, so that the more open country and better climate of the interior has, up to the present, gained most of the attention.

Of the Cache Creek series little can be said; the rocks composing it are chiefly quartzites, dark highly-altered argillites and crystalline limestone, and are supposed to be carboniferous, though no fossils have been found in them in this region, and this classification must be regarded as only provisional. Their extent is very doubtful, and they do not appear to outcrop in the Skeena valley itself, at least as far up as Kispyox; the only locality in the lower part of the Skeena watershed where these rocks were noted being on the Kitsequecla River, a few miles above its mouth. On the Upper Skeena they appear to be more largely represented, as they crop continuously along the river from near the fourth telegraph cabin to the mouth of Bear River, and beyond. The writer is not aware of any claims having been located in these rocks.

The third of these divisions, the Porphyrite group, covers by far the most extensive area, and is also of most interest to mining men, inasmuch as practically all the recent discoveries of mineral occur in this formation, while the coal-measures may, for the present at least, be also included. These rocks are probably of cretaceous age, and vary greatly in composition and appearance throughout the district. While named by Dr. Dawson the "Porphyrite Group" on account of the preponderance of that rock in the Francois Lake district, to the south of the part in question at present; still rocks of volcanic origin are by no means the only ones represented, there apparently having been a gradual change from south to north from beds mainly of volcanic materials to those of purely aqueous deposition.

In and adjacent to the Bulkley valley these rocks cover a great area, and have been studied in more detail than elsewhere, having been prospected more or less thoroughly, and numerous claims located on them. Here volcanic rocks are much in evidence, consisting of porphyrites (andisites), tuffs, agglomerates, etc., often highly amygaloidal with inclusions of calcite, zeolites, epidote, etc., more often occurring in sheets as volcanic flows, but frequently showing evidences of deposition under water, and all more or less regularly bedded. They vary greatly in texture and appearance, in color ranging from light greenish greys to dark purplish reds. Dr. Dawson has estimated their thickness, south of Francois Lake, at about 10,000 feet, and while of necessity this will vary greatly, in the neighborhood of the Bulkley valley it will probably not fall far short of this.

These volcanics have been cut in various places by intrusive granitic areas, which have shattered and metamorphosed them to a great extent. It is along the contacts of these intrusive rocks and the numerous dikes from them with the porphyrites that mineralization has most frequently taken place. The granitic rocks themselves are somewhat variable in appearance, two distinct faces having been noted on the Telkwa River, one consisting of a coarse light colored biotite granite, shading off into a granite porphyry near its edges, and the other of a pinkish syenite porphyry; both, however, seem to have had the same effect in regard to mineralization. The dikes from them show an indefinite number of types.

In the vicinity of the Bulkley there would appear to be, so far as is now known, three main mineral-bearing belts, the most important so far being situated on the Telkwa River, near its head, crossing over into the headwaters of the Morice River. The other two have not been visited by the writer, but from description of prospectors and others conditions there must be very similar to

those on the Telkwa. One of these lies at the head of the Zymœtze or Copper River, including Hudson Bay Mountain, and the other is located on the Babine range, between the Bulkley and Babine Lake, near the headwaters of Driftwood Creek. These two latter districts differ from the first-named, inasmuch as a number of galena leads have been located in them, whereas on the Telkwa district that mineral is seldom seen.

On the Telkwa River the ores consist chiefly of copper, and occur in a variety of ways. At times they are found occupying fissures where the country rock has been shattered near the intrusive granite rocks; this is particularly noticeable in Hunter's basin, at the head of Goat Creek. Replacement along crushed zones is another common form of ore deposition, and again in places the later dikes themselves are mineralized, and in other cases, although the dikes appear to be barren, the porphyrites along their contacts are mineralized; one such case, that of the Black Jack and Dominion claims in Dominion basin, which came under the writer's notice, showed a strong dike about 45 feet wide, cutting nearly vertically the porphyrites, themselves dipping at low angles. The brown trap of the dike seemed to be quite barren, but in certain beds of the volcanics, which were more readily decomposed than others, the country rock had been replaced by quartz, calcite, epidote and ore, which alteration appears to have followed the bedding planes, reaching its maximum intensity near the walls of the dike and gradually decreasing laterally from them.

It will be seen from the above that uniformity in the manner of ore deposition is not to be looked for; probably the most common form is when the large dikes are themselves mineralized, especially along their walls. In such instances the adjacent porphyrites are in most cases themselves decomposed in part and more or less mineral-bearing.

Practically no work has been done on any of the Telkwa River properties beyond mere surface prospecting, and that to a very limited extent only, so that it is much too early to prophesy as to their continuity and ultimate value. In some of the small fissures high grade ore is found, with values chiefly in silver and copper (the gold contents as a rule being small), the ore consisting of a variable mixture of chalcopyrite, chalcocite, copper carbonates, bornite and specular iron, the latter at times being highly micaceous. This micaceous iron seems in places to be associated with silver, as a sample of it, carefully separated from the other materials, gave by assay 8 ounces of silver to the ton. The gangue is usually quartz. The following are a few of the most typical claims of this class, the Rainbow, King, Waresco, Idaho and Russell, all in Hunter's basin.

It is, however, mainly on the larger and lower grade properties that the future of the district depends; the most common ore in these is a mixture of chalcopyrite, a little chalcocite, specular iron and iron pyrites in a gangue consisting of quartz, altered country rock, epidote, calcite, etc., which should make a nearly self-fluxing ore. Among the principal claims of this description may be mentioned the Duchess group, the Evening group, and the Anna-Eva group, all on Howson Creek, and the Dominion and Black Jack claims of Dominion basin.

As a general rule it may be said that, although the greater part of this district is underlain by rocks of the Porphyrite group, no important discoveries of mineral have been made except in the immediate vicinity of the granitic intrusions and the dikes from them, and it would therefore appear conclusive that they were instrumental in the deposition of such ore as has so far been found.

Coal.

Coal has been reported from many widely separated localities in the Skeena watershed, in fact it was known and locations taken up some time before the existence of the metalliferous deposits were noted. To give an idea of the widespread distribution of coal, the following localities may be mentioned where it has been found: The lower part of the Telkwa River and its tributaries; the headwaters of the northern branches of the Morice River; the Bulkley River, from near its junction with the Morice River to the mouth of Sharp Creek, about twelve miles below Moricetown; Driftwood Creek; the Kitsequecla River, near its mouth; the lower end of the Kispyox River; Tzesatzakwa River; the head of Copper River, and near the head of the Skeena River itself.

In not all of these localities have workable seams been found, but it is of interest to note the presence of the coal-bearing rocks, with the possibility of future work showing up other and better seams in some places at least.

It seems probable that all these coals are at about the same geological horizon, and are of cretaceous age, though towards the south, tertiary coals may be represented contemporaneous with some of the volcanic flow rocks there found, which are in all probability younger than those of the Porphyrite series.

Besides being widely distributed throughout the district, coals differing greatly in quality have been found, as a glance at the following analyses will show:—

No.	Remarks.	Moisture.	Volatile Combustible Matter.	Fixed Carbon.	Ash.
1.	2 foot seam, Driftwood Creek, does not coke.	7.90	36.64	42.06	13.40
2.	2 foot seam, Bulkley River, near mouth of Sharp Creek, cokes well	1.02	25.70	52.96	20.32
3.	Top seam, 10 feet, Cassiar Coal Co., Goat C'k, non-coking; sulphur 0.52%	3.40	28.80	62.00	5.80
4.	6 foot seam, Transcontinental Exploration Syndicate, Goat Cr'k, non-coking, sulphur 0.52%	0.90	9.90	75.80	13.40
5.	6 foot seam, Western Development Co. head of Skeena River, non-coking	5.75	7.34	75.26	11.65
6.	4 foot seam, Telkwa Mining, Milling & Development Company, head of Morice River, non-coking ..	0.58	10.82	82.70	5.90

Of these coals Nos. 1 and 2 are not likely to be of much economic importance for some time, occurring, as they do, so close to others of better quality; No. 3 is typical of most of the coal on the lower Telkwa, and should make a most excellent fuel for steaming, while Nos. 4, 5 and 6 may be classed as semi-anthracites; they are all strong, bright coals, and should stand transportation well and may some day supply the greater part of the domestic fuel of the Pacific coast cities.

It is to be regretted that none of these coals make a good coke,* No. 2 being the only one that coked wel lin the laboratory, and it is too high in ash for commercial purposes. In view of the proximity of smelting ores, a good coking coal would be of great value, and it is to be hoped that further exploration will bring to light some suitable seams.

It will be seen from the above analyses that the condition of the coal differs widely at points comparatively near together, and it would appear that the proximity of areas of eruptive rocks younger than the coal-measures has been the chief factor in altering it from a lignitic coal to a semi-anthracite.

Among the better known localities, the Telkwa River field may be mentioned in more detail. Here the coal-bearing rocks overlie those of the Porphyrite group with probably a slight unconformity, but, as they have subsequently been much folded and disturbed, their relationship to one another is not entirely clear. The coal-measures are the highest horizon represented, being

[*Editor's Note.—We wish to take exception to this statement. The usual laboratory tests are not conclusive. Given the proper conditions of comminution and subsequent treatment, many so-called non-coking coals make excellent coke.]

themselves overlain by glacial debris. In a total thickness of not more than 300 feet of measures, four at least, good, workable seams have been uncovered; the intervening beds consisting of clay shales, often highly nodular, with much ironstone, a few beds of soft, crumbly sandstone towards the bottom, and finally a basal bed of coarse loosely-cemented conglomerate, composed chiefly of pebbles from the underlying volcanics.

These rocks must have originally covered a much more extensive area than at present, but their soft nature and consequent inability to resist erosion have resulted in detached remnants only remaining in the valleys. As the valleys are wide, and almost invariably heavily drift-covered, the coal is exposed only where the streams have, in a few places, cut through the deep mantle of gravel to the bed rock; elsewhere no natural exposures are to be found until the higher ridges are reached, consisting of volcanics, the actual contact being everywhere masked. The strata, in addition to this, are much flexed and very subject to faulting, so that it will be readily seen that the task of delimiting the areas and prospecting generally is one of extreme difficulty.

The very small thickness of rocks overlying the coal, and the fact that they are folded in a series of short, rather sharp flexures, and subsequently have been subject to denudation, has resulted at times in the formation of a number of small basins where the seams at no time gain any great depth. It might be possible in such cases to work the coal in a series of open cuts or by stripping the overlying gravel and shales in favorable localities.

Small faults are numerous, and the seams are likewise cut by a number of dikes, usually accompanied by faulting, from the nearby granitic areas.

In regard to the size of the individual seams, the following section was measured at the Cassiar Coal Company's property, on Goat Creek; this is the most complete section to be found anywhere in the district:—

		Feet.
Clay Shales		
	Coal with a few small clay partings	12.0
	Clean coal	7.7
Top Seam	Clay	2.0
	Gray sandy shale and covered, about	30.0
	Coal	1.5
	Clay shale	2.7
	Coal with a few irregular clay partings	14.5
Middle Seam	Shale with ironstone nodules	3.3
	Coal	2.0
	Gray clay shale with nodular ironstone bands, about	50.0
	Carbonaceous shale and coal	2.0
	Coal	1.5
Bottom Seam	Shale	0.5
	Coal with small irregular clay partings	9.0
	Clay shale	——

Several small seams overlie these. A short distance up the creek beyond these exposures the two upper large seams have been burned, leaving thin beds of slaggy material; the overlying clay shales are burned to a brick red, forming a very noticeable feature in the landscape where exposed in a high cut bank. The burnt area, however, does not appear to be of any great extent.

In the Transcontinental Syndicate's openings, a few miles higher up Goat Creek, five seams, 4 feet, 3 feet 3 inches, 4 feet, 6 feet, and 4 feet respectively in thickness were cut in about 130 feet of measures; while on the property of the Telkwa Mining, Milling & Development Company, on the head of the Morice River, at least four seams of the following thicknesses, 4 feet 2 inches, 4½ feet, 4 feet, and 7 feet 3 inches, have been stripped.

Practically all the coal land in this vicinity is controlled by four companies, the three above mentioned and the Kitamat Development Company.

On the Bulkley River, from a short distance above Moricetown to Sharp Creek (about 12 miles), coal outcrops at intervals, but no workable seams have as yet been uncovered. At Sharp Creek nine small seams were stripped, varying from 15 to 40 inches thick, but they all proved too high in ash to be of value (an analysis of one of these is given above).

Near the head of the Skeena, about 150 miles north of Hazelton, another important coal field is situated, which has been prospected in some detail by the Western Development Company, who control about sixteen square miles of coal lands here. In this field the coal measures occur near the top of a great thickness of sedimentary rocks, which probably represent the porphyrites to the south. The rocks here are not so highly disturbed, and there is apparently a greater thickness of overlying strata than at the Telkwa areas. The coal-bearing rocks occupy the trough of a syncline, with gentle dips on either side, the Skeena cutting diagonally across it. At the southern edge of the basin, however, the strata are much more disturbed, being often tilted at high angles. At least one seam of good coal, from 5½ to 6 feet thick, has been opened up at several places, an analysis of which has already been quoted; other smaller seams are known to exist, and it is quite possible that the larger one does not represent all the workable coal in this area. The physical qualities of this coal are all that could be desired. It is extremely hard, resists weathering well, and is bright and lustrous in appearance. Although no recent volcanic rocks are known of in this neighborhood, still evidences of volcanic action are not wanting, as the rocks of the coal measures and the coal itself are found in places to be cut by small quartz veins, sometimes more or less mineralized with iron pyrites.

In most of the other coal districts mentioned no workable seams have as yet been found, the coal being either too thin or too highly disturbed to be economically worked. Taking into consideration, however, the difficulties of prospecting already alluded to, there is no reason to suppose that larger and more favorably situated seams do not exist, at least in some of the localities in question.

Although placer miners were the first to prospect the Skeena country, the results so far have not been encouraging, Lorne Creek being to-day about the only producing locality. This creek has afforded annually a small output of gold since about 1884.

The Omineca country, to the east, and reached via the Skeena and Hazelton, has long been a producer of placer gold. The old diggings are now nearly all abandoned to Chinamen, but there is sai to be a large amount of ground there which can be profitably hydraulicked when transportation facilities have been improved and the cost of working lessened correspondingly. The presence of argentiferous galena in that district has also been known for some years, as well as that somewhat rare mineral, arquerite, a native amalgam of silver, which has been found in the creek gravels.

In the neighborhood of Kitsalas Canon, a number of quartz claims holding gold and copper have been located, but the writer is ignorant as to the conditions prevailing there.

In conclusion, it may be said that lack of transportation facilities has prevented the exploitation of a country rich in possibilities, and until the advent of the railway nothing can be done to open up and develop its latest resources. The present means of communication are highly unsatisfactory, Hazelton, the distributing point, being reached either by pack trail, 400 miles from Quesnel on the Cariboo road, or by river steamer from Port Essington, and as the Skeena is navigable only at certain stages, and then only with difficulty, this route cannot always be depended on. Away from the river, trails are few and bad, and much trail and bridge building will have to be done before even the best known camps are made easily accessible.

The pyroxene group of minerals, found in metamorphic and igneous rocks, are silicates of magnesia with variable proportions of iron, lime and aluminia. In this group are angite, enstatite, diapside and hypersthene.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

The heavy storms occurring at intervals during February interfered, to a considerable extent, with shipments for the month. Notwithstanding, a majority of the larger collieries show increases when compared with the corresponding month of 1906. The Inverness Railway & Coal Company, the Nova Scotia Steel & Coal Company, the Intercolonial Coal Company show substantial increases. The Cumberland Railway & Coal Company, owing to an outbreak of damp, has fallen badly behind in shipments for the past two months; so far behind, indeed, that it will take good work for many future weeks to effect a recovery.

Everyone connected with the coal trade is in good cheer. Prospects never were brighter. The Dominion Coal Company alone has sold close on 1,300,000 tons in Montreal, and an additional hundred thousand or two more could readily have been sold, had the company considered it was in a position to fill the quantity. The Dominion Coal Company are figuring on an increase of half a million tons for 1907. Last year the Intercolonial Coal Company beat all of its former records, and it looks as if the management was determined to make a still better record this year. The quantity shipped last year, 280,000 tons, may not strike the ordinary reader as calling for special comment, but the figures are remarkable when it is considered that the colliery is some two score years old, that its slope is about a mile and a half long, on a pitch of twenty-two, and that the face of the level is a mile or more from the bottom of the slope. It is merry hoisting to bring 1,200 or more boxes along a level and up a slope the long distance specified.

The Province is in excellent cheer over the continued prosperity of the provincial coal trade, and the Premier gave voice to this in bringing down his budget the other day. Royalty on coal is the chief item of revenue of the Province. Last year the revenue from the Mines Department was $642,000, mostly from coal. The revenue from all sources was $1,300,000. Premier Murray predicts that in eight years the royalty from coal alone will equal the total revenue of the Province for 1906. In view of these things, Nova Scotians may well be proud of their mineral heritage.

It is generally believed, down this way, that matters looking to a settlement of the Steel-Coal difficulty are progressing satisfactorily, and that a definite arrangement is only a matter of time—a few weeks—perhaps. But a settlement does not mean that the Steel Company will abandon efforts to secure an adequate supply of fuel from its own mines. When the furore was at its height reports were current that the Steel Company had acquired options on territory at Langan, Port Morien, etc. Those in the ken shook their heads and muttered, "this will not do." There were other larger and better areas left out of count, and until the Steel Company sought and obtained options on these they were not in earnest in the matter. That they were in earnest is now made clear by the Steel Company securing options on the Burchell areas at Point Aconi. It is claimed that in these areas there are hundreds of millions of tons. I am content to put the available quantity at seventy-five millions. The areas are submarine, and in order to have easy access to the outlying areas it is necessary to go through an area owned by the Dominion Coal Company. The Government evidently favors granting permission to the Steel Company, as a bill dealing fully with the matter of an entrance to submarine areas has been brought in. A striking feature of the bill is that the Government are the sole judges as to the damages to be allowed the holders of the areas through which an entrance is effected. This bill, however, does not dispose satisfactorily of the whole question of submarine areas. It is this way. A dozen or more years ago few people attached much value to the areas under water. For instance, the General Mining Association when in operation—though they could have acquired miles seaward—were content with taking up one mile only out from shore. Similarly, the Dominion Coal Company did not see the wisdom of extending their areas at Table Head (Dom. No. 2) more than a mile and a half seaward. At that time it was either considered that the coal did not extend far seaward, or that it could not be profitably mined for more than a mile or two beyond the high water mark. Opinions since then have changed, and it is now believed that mining can be prosecuted under water almost indefinitely. The Nova Scotia Steel & Coal Company took it into its head that it would take up some sea areas in front of the Dominion Coal Company at Table Head, and did so, securing many miles. Then the Dominion Coal Company thought it would pay back in kind, so stalked over to Point Aconi and took out many areas in front of the Nova Scotia Steel Company, and so we have the spectacle of the Steel Company property in front of the Coal Company and preventing extensions seaward, and a similar thing in the case of the Coal Company. There are other companies besides these two which are in similar awkward predicaments. It is suggested that a commission be appointed for the purpose of effecting an amicable exchange of submarine areas, the Dominion Coal Company, for instance, abandoning the areas at Point Aconi, and the Nova Scotia Steel & Coal Company abandoning in turn those at Table Head, the one for the other.

The Miner's Union has made a demand on the Government for the enactment of an eight-hour day, weekly pays, certificates for iron ore miners, and old-age pensions. The Government will be unable to see its way to comply with either of the three first named, but will appoint a commission to enquire into the schemes of old-age pensions in other lands.

It is reported that the Nova Scotia Steel & Coal Company have acquired options on what are held to be extensive iron ore areas at Arisaig, N.S. It is freely predicted that from this out the iron ore trade of Nova Scotia, which has shown little activity for years, will take on vigorous new life. The talk generally is optimistic. Included in this talk is the re-opening of the unlucky Broughton Colliery. It is said a further large sum of money has been obtained in Britain whereby to purchase an area of the Dominion Coal Company which stood in the way of economical developments, and to complete new plans for successfully operating the colliery.

NOVA SCOTIA GOLD MINES.

Moose River District.—The Consolidated Mines Company of Canada, capitalized at $5,000,000, has been organized to work the amalgamated properties of the G. & K. Mining Company and the Moose River Mining Company. The G. & K. property now has a forty-stamp mill and it is proposed to enlarge this. At present, attention is being devoted to getting a summer's supply of wood, and not much mining is being done. New boilers will shortly be installed, also an air compressor, as they are now getting their air from the Tourquoy Mining Company, which has a water-driven compressor. The company also contemplates developing water power at Scraggy Lake and transmitting it electrically over to the mine.

The Tourquoy Gold Mining Company, under the management of Mr. Robert Kaulback, has been successful in again finding the pay chute in No. 3 belt, which they lost a little more than a year ago. The Britannia belt is also showing good values. The company's dam has been repaired, and sufficient wood has been hauled out to last the summer. There is about 150 tons of ore now in the mine ready to be crushed.

Upper Seal Harbour.—The Dolliver Mountain Mining Company are contemplating the transmission of electrical power from their power plant to outlying mines in Isaac's Harbour.

The Beaver Hat Gold Mining Company, in the same district, are still operating their five-stamp mill.

Cariboo District.—Mr. L. W. Getchell is working the Dixon property. About sixty tons of ore per month are being mined, and, as there is no stamp mill on the property, the ore is hauled to the Baltimore & Nova Scotia Company's mill for treatment. Mr. Fred. Darragh is in charge during Mr. Getchell's absence in the States. A large supply of cordwood has been secured, and a good summer's campaign is expected.

COBALT.

Mr. Rochester, of the Cobalt Lake Mining Company, who was in Ottawa last week, has returned.

A 4-INCH VEIN OF COBALT ORE AT THE EVANS MINE.

Mr. and Mrs. Adler, of the Foster Mining Company, have moved into their new house at the mine.

Mr. J. W. Evans, mining engineer of Cobalt, has taken Mr. J. T. Laidlaw, mining engineer of East Kootenay, B.C., into partnership. The firm will be Evans & Laidlaw, with offices at Larder Lake, Toronto and Cobalt.

Mr. Longwell, of the Coniagas, who has been in New York looking after the company's ore shipments, has returned to town.

Mr. R. W. Leonard, president of the Coniagas, is in town.

Mr. Culbert, of the O'Brien, has left on an extended trip to Mexico.

The McKinley-Darragh-Savage Mining Company have about completed their stamp mill and concentrating plant, and this plant should prove very successful in treating the low grade ores.

The Nipissing Mining Company are pushing the work of development on their veins underground, and have a large quantity of ore blocked out.

The Jack Pot Silver Mining Company have placed an order with the Allis-Chalmers-Bullock Company for a 20 horse-power boiler and hoist, and are opening up their vein adjoining the Nancy-Helen Mine.

At the O'Brien Mine, Manager Culbert is pushing the work on the company's new office and putting in extensive water works for domestic use and fire protection.

The Imperial Cobalt Silver Mining Company, operating near Portage Bay, are installing a three-drill air compressor, a 60 horse-power boiler, and are at present busy erecting a new boiler house. The management expect to have three drills working underground by the end of the month.

The Cobalt Lake Mining Company are getting out some very fine silver ore, and have a quantity already sacked in their ore house which assays $3,000 per ton in silver. Their new boilers and machinery are on the way, and Mr. Fraleck, the company's engineer, is getting the foundations prepared and rushing the work of installation. The shaft on vein No. 4 has been sunk to a depth of thirty feet, and the vein shows an average width of nine inches. Five inches of this is niccolite, containing wire silver, and four inches of it calcite, argentite and wire silver, and assays from three to six thousand ounces of silver per ton. On No. 2 vein an open cut is being driven into the bluff, and of five feet. No. 3 vein is solid nicollite from 12 inches to 15 inches in width, and, so far as known, is the largest vein of massive niccolite in the world. So far all of the six veins yet discovered on this property are of practically right angles to the lake, and continue, so far as known, under the lake. Soundings have been taken over three-quarters of the lake, which disclose a clay bottom of from twenty to forty feet think. This insures the dryness of the shafts and drifts under the lake, and makes the conditions of mining on this property similar to that of the other mines in camp.

Larder Lake is still attracting the attention of the prospector and investor, and many rich samples have been brought down from this interesting district. It will be two months yet before intelligent examinations can be made and any idea arrived at as to the value of the claims already found. One good gold mine would be the making of Larder Lake, but as nine out of every ten claims have been staked on chance, in a depth of snow from two to three feet, little development work has been done as yet.

Numbers of men, with loads of supplies, are going there every day from all parts of the country, and it won't be for want of enterprise or careful prospecting if Larder Lake district does not show up well is summer.

Numerous finds of native silver have been reported to the west of Cobalt. Several finds have been made near Lady Evelyn Lake, and some rich samples have been brought down from them. Native silver is also reported to have been found in James township. This is very significant and shows the silver-bearing area much more extensive than was at first supposed. From a few miles square the area has now expanded to twenty-four miles by about ten miles, or 240 square miles.

SHAFT HOUSE—THE EVANS MINE, NEAR PORTAGE BAY, COBALT DISTRICT.

It is anticipated that more prospecting will be done this summer than any previous year in Cobalt camp.

THE PROSPECTUS OF THE TRUTHFUL JAMES MINING COMPANY.

The directors of this company expect to make ten times their money out of the public, as they do not contemplate putting their own hard-earned money into any mining enterprise. So far the company has two mining properties, for which they paid a total of $130.

Property No. 1 cost them $100, and property No. 2 $30, besides two bottles of whiskey for the embarassed prospector from whom they bought the claims. Already about $37 worth of work has been done on property No. 1, at an expenditure of $480. The directors have also paid $5 to the mining expert for his report, and have promised to print 5,000 copies of the prospectus as an advertisement for him.

No veins have as yet been discovered on the property, but one fine wall has been found to which a small stringer of smaltite was attached, which one mining expert pronounced calcite, and which, he said, would undoubtedly lead to rich silver values at depth. The property is only 6,559 feet 3¼ inches from the Woolly Wonder Mine, whose vein our expert has traced over on our property.

The company has spared no expense in securing the services of Mr. Lieswell, the mining expert, who graduated with honors at Fakerourg in 1837, and who has had 102 years and 3 months' experience in this branch of mining.

We quote the following from our expert's report: "The country rock is a greenish grey calcareous peroxidite, heavily mineralized with hornaceous, schmisatic magaphone granite, and is cut by violent intrusions of pink felsnapthic andorite, with rhyolusic inclusions. This gives an abundance of contacts in the property, which will increase in value as they go down. Only one contact is still lacking, and your directors must arrange for that."

In conclusion, our expert states: "This is undoubtedly the finest property I have seen in camp."

We want it clearly understood that we are not responsible for any statements made by our expert; also that none of the directors are putting any of their money into the enterprise, but are relying on the public's money entirely to make it a success.

BRUCE MINES DISTRICT.

Considerable activity is now apparent in the copper mining industry in this neighborhood. During the past few years mining in the district has been in a state of stagnation, but signs are not wanting that a welcome revival has set in. In the past the principal obstacle with which mine owners have had to contend has been the lack of facilities for treating their output on the spot, and the cost of shipping ore to any of the existing smelters in Canada or the United States has proved a considerable handicap to the smaller producers. The prospect, therefore, of custom smelters being erected during the current year at Sault Ste. Marie and Bruce Mines, has given a decided flip to the industry, and renewed enegy is evident on most of the properties in the locality. The Bruce Mines were, last year, opened up again, and are now being actively worked with English capital. Operations have been commenced on the Campbell Mine. The Superior Mine, on the Algoma Central Railway, the Northern Ontario Company's property, and the Jury at Dean Lake are being rapidly brought to the producing stage, while negotiations are pending for the opening up of several other rich prospects. An important factor in the success of this district will be the extension of the Bruce Mines & Algoma Railway to the north. At present only eighteen miles of this road have been constructed, viz., from Bruce Mines to Rock Lake. An option has recently been taken, and if, as is projected, the line is pushed on to join the Canadian Pacific Railway's main line, a large tract of rich mineral country, hitherto unexplored, will be opened up. There is abundant evidence that the possibilities of this part of Algoma are becoming apparent to the mining capitalist, and, with the recent influx of English and American capital and the undoubted mineral wealth of the country, everything points to its rapid development into one of the chief copper producing centres of Canada.

The Copper Mining & Smelting Company are preparing to set their concentrating mill at Bruce Mines in motion this spring. Various additions have had to be made, owing to the sale by the former owners of a portion of the machinery, and an order has been placed with the Jenckes Machine Company, of Sherbrooke, for the supply of a 300 horse-power cross compound Corliss engine, a 75 horse-power slide valve engine for the crushers, and a 40 horse-power engine for hoisting purposes. Satisfactory progress is being made in the production of ore, and the company has now nine drills at work on stoping and development.

ALBERTA.

Last year sixteen new mines were opened in Alberta. Sixty-four are now working. The expenditure through the coal mines department was $4,500.

It is understood that no more coal lands are to be sold by the Dominion Government. The Government intends holding the lands and leasing them on twenty-one-year leases, at an annual rental of one dollar per acre. No leases are to be issued for less than 2,500 acres, so that, paying this minimum amount rental, a company will have every incentive to early development of its holdings.

BRITISH COLUMBIA.

A. J. Bible was killed at Le Roi Mine, on March 16th, while loosening frozen ore at a dump.

Mr. Thomas Kiddri, well known as a smelter-man, left recently for Prince of Wales Island to superintend construction there.

Much feeling has generated in British Columbia by the recent enforcement of the Lord's Day Observance Act.

The Maple Leaf Mine, in Franklin Camp, B.C., has been sold to Grand Forks and Vancouver parties. Its capitalization is fixed at $250,000.

MEN AND MATTERS.

On March 9th George Thompson, shift boss at the Trethewey mine, was killed by an explosion of dynamite.

It is stated that options have been secured on the Richardson zinc ore lands in Frontenac county, Ont., and that a smelting and refining plant will be erected in Kingston.

Mr. J. B. Woodworth, formerly manager of the Nova Scotia & Silver Cliff properties, in company with Mr. H. V. Somerville, an English mining engineer, has gone to Mexico for a month.

From Point Aconi, Cape Breton, come reports of progress being made by the Dominion Steel Company in boring for coal in the Burchell areas. The Steel Company has bonded about five hundred acres on the eastern side of Little Bras D'or.

The Edmonton Standard Coal Company, of Edmonton, Alberta, has taken over the Brenton and Parkdale mines.

Shipments of silver-lead ore from the district of Slocan, B.C., increased from 457 tons in December to 509 tons in January.

Legislation has been promised to straighten out the existing unsatisfactory state of the coal and oil licenses in Southeast Kootenay, B.C.

The old Pictou, N.S., copper smelter is to be put in commission again. It has lain idle for some years. The capacity of the furnace is 75 tons of ore per day. The copper ore bodies of Pictou county are yet undeveloped.

PERIODICALS.

The *Mining World* for March 9th begins a new department, "Corporation Affairs and Finances." The issue of March 16th gives a highly instructive article by Dr. R. S. Moss on "The Manufacture of Coke from Western Coal."

The *Mining and Scientific Press* of March 7th contains a well-illustrated and carefully-written article on "Deep Mining in the Lake Superior Region." In an editorial, the *Press* sounds a warning note about Larder Lake.

A description of the "Gold Prince Stamp Mill and Mine," of Animas Forks, Colo., is a leading feature of *Mines and Minerals* for March.

The *Mining Reporter* for February 28th contains a very useful article, "Some Sampling Results," which deals fully with the question of sampling gold reefs.

A very timely description of "The Revival of the Mining Industry in Cornwall" is a special feature of the *Engineering and Mining Journal* of March 9th. Prominent in the issue of March 16th is an outline of works on "The Low Grade Copper Deposits at Ely, Nevada."

The Colliery Guardian, London, England, in an editorial on

Professor Lapworth's estimate of Great Britain's coal reserves, remarks that "the visible coal fields, in fact, sink into insignificance in comparison with those which lie buried."

In the London, England, *Iron and Coal Trades Review* of February 22nd is a paper on "Fly-wheel Storage Systems."

The February number of the *Chemical Engineer* gives an interesting acount of a peculiar boiler deposit. The first of a series of articles in the electro-chemical problem of the fixation of nitrogen also appears in this number.

The *Canadian Electrical News* presents a very clear paper on "Meter Testing," by Mr. Oliver J. Bushnell.

Hardware and Metal for March 16th has been received. Among other matters, we find a valuable summary of Canadian metal markets.

Other publications received are:—Proceedings of the Cleveland (England) Institution of Engineers, the *Weekly South African Miner*, Bulletin No. 29 of the Institute of Mining and Metallurgy, London; Report of the Ontario Bureau of Mines for 1906, *The British Columbia Mining Exchange*.

The *Maritime Mining Record* of March 13th gives a very complete summary of news and movements in Nova Scotian coal fields.

CATALOGUES AND OTHER PUBLICATIONS RECEIVED

Messrs. Sinclair and Smith, surveyors and engineers, of New Liskeard, Ont., have issued a timely map of Larder Lake district.

THE JOURNAL is indebted to Mr. Harold P. Davis, of Silsby & Davis, New York, for a large blue-print of Coleman township, showing location of mines, etc.

Mussens Limited, of Montreal, Que., are sending out their catalogue, No. 11, which contains descriptions and illustrations of various types of metallurgical machinery. Among the stamp mill supplies we note particularly the Improved Homestake Mortar and the Blanton Self-Tightening Cam.

A folder entitled "Mine-A-Phone" describes the mine telephones manufactured by the Stromburg-Carlson Telephone Manufacturing Company, of Rochester and Chicago.

The Balanced Cable Crane Company, of 135 William street, N.Y., are circulating a fully illustrated catalogue describing their Balanced Cable Crane. They make several strong claims for their crane, among which are the absence of shock and the simultaneous use of any number of motor cars.

A leaflet showing the Campbell Gas Engine and Suction Gas Plant, manufactured in Halifax, England, has been received from the Canadian agents, the Producer Gas Company, of 11 Front street east, Toronto, Ont.

Catalogue No. 10, issued by Mussens Limited, of Montreal, P.Q., contains a list of mine supplies.

In view of the promised development of coal mining in the west, and the increased demand in the East, a catalogue received from the Jeffries Company, of Columbus, Ohio, is of especial interest. That company's devices for loading, unloading and for the general handling of coal and ashes, are admirably modern and complete.

The Allis-Chalmers Company are distributing as a March leaflet a description of their direct current motors and generators, type "K."

Bulletin 142 of the Sturtevant Engineering Series, published by the B. F. Sturtevant Company, of Hyde Park, Mass., illustrates thoroughly their generating sets with compound engines, Class V. C. 6.

DIVIDENDS

The Granby Consolidated Copper Company declared a quarterly dividend of 2 per cent. on March 30th. The dividend amounted to $405,000.

A dividend of $28,000 was declared on February 1st by the International Coal & Coke Company, of Coleman, Alberta.

The following companies have declared dividends, payable at the dates and for the total amounts specified:—

Dominion Coal—April 1st, $150,000.

Nova Scotia Steel—April 15th, $74,555.

Trethewey—March 15th, $40,000.

The Bunker Hill & Sullivan Mining & Concentrating Company, B.C., has just paid a dividend amounting to $180,000. This makes a total, since January 1st of this year of $360,000.

CANADIAN PATENTS

(Obtained through courtesy of Fetherstonhaugh & Company, patent lawyers, Toronto.)

February 26.—103,776, F. C. Loring, Eastport, Me., hydrocarbon burners; 103,788, H. A. Johnston, Toronto, Ont., internal combustion engines; 103,801, J. C. Davis, Hinsdale, Ill., process of making castings; 103,831, R. Sugfried, Pittsburg, Pa., flexible connection for gearless motors, Canadian Westinghouse Company, Limited.

March 13.—103,884, G. R. Prowse, Montreal, Que., apparatus for generating and superheating steam; 103,899, F. Von Engelgen & G. O. Seward, Holcomb's Rock, Va., processes of decarbonizing; 103,936, A. Pederson, Cleveland, Ohio, electrically operated portable drills, the Van-Dover Elliott Electric Company.

MARKET REPORTS

LONDON.—Week ending March 9th.—Enquiry for refined copper is far beyond capacity of the suppliers. Electrolyitic sells at £118 to £120 net.

Tin.—Operations in tin are quiet. English ingot tin is easy at £195.

Lead is advancing, and a further rise is expected. It is quoted at £20 5s.

Spelter is steady at £26.

Iron and Steel—The market is slightly flat. Pig iron is quoted at 54s. 10d. for Cleveland iron.

Antimony—£98 to £102.

Quicksilver—£7 per bottle.

Silver—31¾d. spot and 31⅝d. forward.

NEW YORK, March 13th—

Lake Copper—Per lb., 26 cents.

Electrolytic Copper—Per lb., 25½ cents.

Silver—Per ounce, 68⅜ cents.

Tin—Per lb., 42¼ cents.

Lead—Per lb., 6 cents.

Spelter—Per lb., 6 9-10 cents.

TORONTO, March 15th—

Pige Iron—Market in good condition. Radnor (charcoal), $33; Londonderry, $26; Middlesborough No. 1, $23.50.

Tin—Steady at 45 cents for ingots.

Copper—Sheet, $35 per 100 lbs.; ingot, $27 per 100 lbs.

Lead—Bar, $5.75 to $6; sheet, $7.

Zinc—Foreign, 7½ cents per lb.; domestic, 7 cents per lb.

Antimony—Market strong at 27 cents per lb.

TAILINGS

In nature, cobalt is principally found in combination with arsenic and sulphur.

The residue from the roasting of cobalt ores is caller safflor, and is often met with in commerce.

Scribbling paper dipped in melted paraffine wax may be used for indicator drops, instead of porcelain tiles.

Sea water contains ont only silver, but gold. The latter metal is present to the extent of about five milligrams to the ton.

Aluminium is much more sonorous than most other metals. Iron and silicon are the chief impurities of commercial aluminium.

The mineral resources of Quebec, only partially developed as yet, include gold, silver, asbestos, mica, chromite, magnetite and feldspar.

A solution containing as little as 0.015 per cent. of cobalt will give a distinct blue color when boiled with strong hydrochloric acid.

Ankerite, or lime-magnesia-iron carbonate, carrying small percentages of manganese carbonate, is mined in Nova Scotia. It is used instead of limestone as a flux in blast furnaces.

Nickel is much more easily reduced than cobalt. Nickel melts more easily. Cobalt fuses at a temperature only a little lower than that at which iron does. In general, cobalt resembles iron; and nickel resembles copper. Both nickel and cobalt have magnetic properties.

The "rescue chamber" is a safety provision of some of the large Austrian mines. It is a strongly-timbered retreat, and its single entrance has a door that can be made tight against air and water by means of rubber fittings. It has three cylinders of oxygen, sufficient to enable thirty men to breathe three days. Inhalation gear is at hand for parties leaving the chamber for reconnaissance or signalling, and canned foot, mediciens and first aid appliances are also kept in the place. The standard room will accommodate 24 men for a reasonable time for rescue.

The world's platinum is mostly supplied by Russia, but the production has not been keeping pace with the rapidly increasing demand. In consequence the value has nearly quadrupled in fifteen years, having advanced to $21.00 a nounce—or more than gold—early in 1905, and quite recently to $34.00 an ounce. Search for new sources of supply has been made, especially in the United States. This has shown that platinum exists in fifteen counties in California, 9 in Oregon, 8 in Idaho, 4 in Colorado, 3 in Washington, 2 in Montana, and one county each in Utah, Arizona and Wyoming. Profitable mining seems to be promised in Southern Oregon and Northern California.

"THE UNDEVELOPED MINERAL RESOURCES OF CANADA"

We regret that some rather inexcusable typographical and other errors, not noticed in the hurry and bustle of bringing out a first issue, appear in our last number. In the case of the abstract of Dr. F. D. Adams' paper on the above subject these errors are of a very glaring nature, and in justice to the author we desire to call attention to them.

1. On the ninth line from the beginning of the article it is stated that "in the last twenty years the mineral output had increased from a valuation of *the* million dollars per annum." This should read "a valuation of *ten* million dollars."

2. Page 14, ten lines from the top of the first column: "Although the area of the *trap rock* in Nova Scotia is comparatively small." This should be: "Although the area of rocks of carboniferous age in Nova Scotia is small as compared," etc.

3. Eighteen lines from the top of the first column of page 14: "And this represented a very small section of the undeveloped coal resources of *Cape Breton*." "Cape Breton" should be *Nova Scotia*."

4. Twenty lines from the top of the first column of page 14: "In New Brunswick there is a great distribution of the carboniferous system, but the coal *fields* are thin." It should read: "But the coal *seams* are thin."

5. Five lines lower down: "Again, all along the southern side of the Bay of Chaleurs are *undeveloped coal fields*." This should be: "Are *rocks of carboniferous age*."

6. Last line of column 1, page 14: "Riviere du Loup en *nant*." This should be "*haut*."

7. Eleven lines from the top of column 2, page 14: "Crossing the plains fine gold is found in the *lands* of the Saskatchewan River." This should be "*sands*."

8. Page 15, eighteen lines from the top of column 1: "We find there are fields of Huronian rocks *extending* into Michigan and Minnesota." This should be: "In the States of Michigan and Minnesota."

9. About the middle of the same column: "While south of Georgian Bay iron also occurs." This should read: "About the southern extremity of Hudson Bay."

GOLD PLACERS WANTED—To work on shares by machinery interests. Write full particulars to F. Whitney, Munsey Building, Washington, D.C.

COBALT ORE WANTED—With no or but small silver values; high nickel contents desirable. Address, Exporter, c/o MINING JOURNAL.

CANADIAN MINING INSTITUTE

Incorporated by Act of Parliament, 1898.

AIMS AND OBJECTS.

(A) To promote the Arts and Sciences connected with the economical production of valuable minerals and metals, by means of meetings for the reading and discussion of technical papers, and the subsequent distribution of such information as may be gained through the medium of publications.

(B) The establishment of a central reference library and a headquarters for the purpose of this organization.

(C) To take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada.

(D) To encourage and promote these industries by all lawful and honourable means.

MEMBERSHIP.

MEMBERS shall be persons engaged in the direction and operation of mines and metallurgical works, mining engineers, geologists, metallurgists, or chemists, and such other persons as the Council may see fit to elect.

STUDENT MEMBERS shall include persons who are qualifying themselves for the profession of mining or metallurgical engineering, students in pure and applied science in any technical school in he Dominion, and such other persons, up to the age of 25 years, who shall be engaged as apprentices or assistants in mining, metallurgical or geological work, or who may desire to participate in the benefits of the meetings, library and publications of the Institute. Student members shall be eligible for election as Members after the age of 25 years.

SUBSCRIPTION.

Member's yearly subscription $10.00
Student Member's " 2.00

PUBLICATIONS.

Vol. I, 1898, 66 pp., out of print.
Vol. II, 1899, 285 pp., bound red cloth.
Vol. III, 1900, 270 pp., bound red cloth.
Vol. IV, 1901, 333 pp., bound.
Vol. V, 1902, 700 pp., bound.
Vol. VI, 1903, 520 pp., bound.
Vol. VII, 1904, 530 pp., bound.

Membership in the Canadian Mining Institute is open to everyone interested in promoting the profession and industry of mining without qualification or restriction.

Forms of application for membership, and copies of the Journal he Institute, etc., may be obtained upon application to

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Spring Catalogue will be ready for mailing by the first of March. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our Spring Catalogue for 1907 will be a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend.

Write for it now so as we can have your name on the list in time.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business and town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes, 35 to 44. We offer these suits to readers of this paper for..... **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper..... **$5.00**

1,000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper..... **.90**

UNDERWOOD

The Underwood is a GOOD Typewriter
It is the BEST Typewriter

¶ Its advent marked a new era in the conduct of business.

¶ For mutual protection against the instant success of the UNDERWOOD a half dozen of the other leading typewriter companies combined; they are known as "the trust"

¶ Their united efforts had no effect in impeding the marvelous development of the UNDERWOOD business—the largest typewriter business in Canada.

¶ The UNDERWOOD is a GOOD typewriter. It is the BEST typewriter,—and that is the full explanation of its success and popularity.

AUSTIN CRUSHERS

ARE FAVORITES WITH MINING MEN

BECAUSE

They have a large capacity.
They work longer and require less attention than other machines.
They do not require constant attention in oiling, as the automatic oil pump does what in other machines must be left to the engineer, and even then be uncertain.
All parts are easy of access.

PORT HOOD COAL

We can say, without fear of successful contradiction, that the coal now being mined by us at Port Hood is equal to or better than any now being mined in this Province. It is meeting with general approval from DEALERS, CONSUMERS, AND MANUFACTURERS. All who are open to make contracts for Summer or Winter delivery should write us for special terms at once. "New and powerful tug boat to attend to all vessels." Deliveries effected by large or small steamers, or via rail.

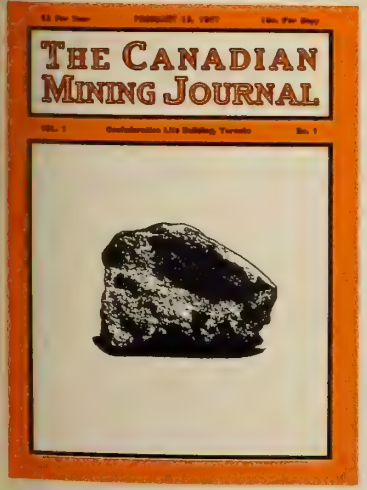
Is The Best House Coal in Canada

From Publisher to Reader

The diversified field of Canadian mining admits of adequate treatment only when dealt with in sections. While endeavoring to make each number of The Canadian Mining Journal contain something of local interest to each of the mining districts of the Dominion, it is intended that, from issue to issue, some one locality or Province will be given more exhaustive treatment.

The first number of the Journal devoted a rather large amount of space to the new Cobalt nickel-silver district of Northern Ontario, and stamped that number as a Cobalt one by using on the front cover the handsome colored engraving of a Cobalt specimen, that won such encomiums on the appearance of this issue.



The series was departed from by the second number in compliment to the Canadian Mining Institute, whose annual meeting and proceedings were amply dealt with.

With this, the third number, we again take up our plan of dealing with the several mining districts of Canada in greater detail, this time featuring the richly mineralized Province down by the sea. The specimen of Nova Scotia iron ore which appears on the front cover is somewhat reminiscent of the one used on our first number, and although the values per ton are scarcely so great as in some of the native silver slabs from Cobalt, the immense deposits of this ore in the Eastern Province, in close proximity to the extensive maritime coal fields, promise wealth little less alluring.

In our next issue the Province of Quebec will be given the place of honor, and a specimen of asbestos, as a representative mineral, will be reproduced in the natural colors on the front page.

This series will be continued from time to time until the representative minerals of Canada have been exhausted.

In our efforts we want your co-operation. Suggestions and criticisms will be welcomed by the Editorial department. The Business department appends a subscription blank and will appreciate your support as a subscriber. If you have already sent us your subscription kindly recommend The Journal to your friends. Sample copies will gladly be sent to any address on application.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The Attention of Miners and Capitalists in the United States and in Europe is invited to the

Great Mineral Territory

Open for Investment in the Province of Quebec.

GOLD, SILVER, COPPER, IRON, ASBESTOS, MICA, PLUMBAGO, PHOSPHATE, CHROMIC IRON, GALENA, Etc.

ORNAMENTAL AND STRUCTURAL MATERIALS IN ABUNDANT VARIETY

The Mining Law gives absolute security to Title, and has been specially framed for the encouragement of Mining.

All mines belong to the government of the Province on all unsold lands and on all those sold since the 24th of July, 1880, but gold and silver are always reserved, whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such licenses the first right to purchase the mines. In the case of lands where the surface alone is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is $5.00 per 100 acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the government. The purchase price is as follows :

Mining for superior metals on lands situate more than 12 miles from a railway in operation, $5.00 per acre, and on lands situate less than 12 miles from such a railway, $10.00 per acre ;

Mining for inferior metals—the price and the area of the concessions are fixed by the Lieutenant-Governor in council.

The words "superior metals" include the ores of gold, silver, lead, copper, nickel, and also graphite, asbestos and phosphate of lime ; and the words "inferior metals" mean and include all the minerals and ores not included in the foregoing definition and which are of appreciable value.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

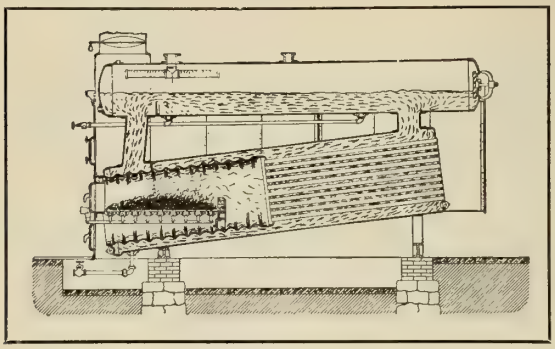
Patents are obtained subject to the following conditions : The full price must be paid in cash ; specimens must be produced and accompanied by an affidavit ; a survey at the cost of the applicant must be made on unsurveyed lands ; work must be bona fide begun within the two years.

Mining licenses giving the right to work the mine and dispose of its products, are granted on payment of a fee of $5.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts. The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mlneral belt in which remarkable discoveries of minerals have already been made, and through which the New Grand Trunk Pacific Railway will run.

The government has made special arrangements with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.



The Bureau of Mines at Quebec, under the direction of the Superintendent of Mines, will give all the information asked for in connection with the mines of the Province of Quebec, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to :

MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

DR. W. H. DRUMMOND

The death of Dr. Drummond deprives Canada of a singularly gifted son. For the past two or three years Dr. Drummond had been associated with his brothers in the development and operation of the well-known "Drummond" Mine in Cobalt, where, latterly, he spent most of his time. It was here that he died, after a brief illness, on April 6th.

Dr. Drummond's kindly muse was both robust and homely. Many of his "Habitant" poems are already accepted as permanent additions to Canadian literature. His books are looked upon as an essential part of any camp equipment. He wrote of Canadians, for Canadians. His field was his own. As a sympathetic interpreter of French-Canadian rural life he stands unapproached. His untimely death came as grievous shock to the whole nation.

FORESTRY

The Canadian Forestry Association held its eighth annual meeting in the Railway Committee Room of the House of Commons, Ottawa, on the 14th and 15th of March. The growing sentiment in favor of a more conservative and far-sighted policy in regard to our forests has been strongly in evidence at recent meetings of this association, as also in discussions of the subject in the press, and in the efforts which have been made in recent years to found forestry schools in Canada. The subject is of far-reaching importance in engineering. Wood is now and always will be cheap, strong, and easily worked structural material. For many purposes we can hardly hope to replace it. For example, it is doubtful if it can be advantageously replaced for railway ties or for mine timbers. Civil engineers are in this and in other ways intimately concerned in the question as to how we in Canada can best conserve our forest resources, and how best provide a growth of timber in those parts of the Dominion where the supply is insufficient for local demands. For in the long run it will surely be cheaper to grow the timber reasonably near the place where it is to be used than to transport it over great distances. Our great railway companies, particularly those which control extensive tracts of land, might consider whether it will not be better to set aside lands to grow tie timber for the future, rather than to sell it for a few dollars an acre.

The question is also one of deep concern for mining engineers. A constant supply of mine timber is needed, not to speak of lumber for buildings. But a more serious problem for many mines is the one of fuel. The waste in this respect is painful to contemplate. Many mines are so far from cheap transportation that coal is almost out of the question for fuel. And when the wood within reach has been used up, it often happens that the manager has nothing but a barren prospect of hopeless old brule to contemplate when he looks around for fresh supplies. The last report of the Ontario Bureau of Mines mentions a case in which a mine was closed down owing to scarcity of fuel.

Metallurgists are also interested in this subject. Charcoal is a pure fuel for reducing purposes. At Radnor

Forges, in Quebec, and at Deseronto, Ontario, high grade iron has, for many years, been made in charcoal furnaces; but the increasing difficulty of getting a supply of wood for charcoal has become a very serious problem. The charcoal retorts have been living on capital, and as a natural consequence the supply of wood is getting farther and farther away. If the rocky portions of the country, unfit for farming purposes, were kept permanently covered with forest growth, the annual increase would give a perpetual supply of wood for the manufacture of charcoal, railway ties and mine timber, not to speak of the more general uses, such as for domestic fuel, furniture, farm implements, and buildings.

It is not necessary for Canada to pass through the stages of waste and lack of foresight which have cost some of the European countries so dearly. It is possible for us to take as our object lesson the dreary wastes of bare hillsides in some parts of France and Italy, where millions are now being spent in the effort to restore the forest covering. We might even get our warning nearer home. Wisconsin has eight million acres of worthless lands, once covered with a fine growth of timber. Michigan can also show her warning scars. Both States, with many others, must now consider, if they have not already begun to solve, the slow and very expensive process of reforestation. Why should not Canada omit this stage? She can do so by selecting now the lands which are to remain under forest because unfit for farming, or because the forest is needed to conserve and regulate the flow of water from watersheds. This means wise foresight, a far-seeing view of national interests—in a word, statesmanship.

THE LORD'S DAY ACT

On March 1st the Lord's Day Act became operative in British Columbia. Its rigid enforcement will, beyond all shadow of doubt, militate against the mining and smelting industries, more particularly against the latter. In itself the Lord's Day Act may be an admirable thing. In its general operation it may conduce to the good of the whole Province. But its promoters should take care to inform themselves thoroughly as to its certain effect upon the mining and smelting interests.

There are several metallurgical processes, the whole value of which depends upon their continuity. For example, no iron smelter could survive a regular stoppage of work on Sundays. At nearly all mines a certain amount of labor must be performed on the Sabbath, else work would be suspended on Monday.

We know of a case in our own experience, where the over-zealous apostle of Sabbath observance wrought havoc with a struggling enterprise. Should British Columbia be made to suffer from the intemperance of religious enthusiasts, the whole question of Sabbath observance will receive a serious setback.

MONTREAL RIVER

After such examination as the weather conditions of early spring would permit, Professor Miller reported favorably upon the new silver district lying between Lady Evelyn Lake and Elk Lake. Even tentative official approval will cause a tremendous rush to these areas. As one possible effect of this movement, it is to be hoped that the tropical growth of Larder Lake capitalizations will be checked as by the expulsive power of a new affection.

In his earliest report on Cobalt, Professor Miller asserted that there was every likelihood of recurrences, to the west, of deposits similar to those at Cobalt. This is one addition more to the debt that the Province and the mining fraternity owe to the sagacity and perspicuity of Ontario's Provincial Geologist.

THE PROMOTER

The professional promoter has many sins for which to answer. When the high gods look over his accounts they will notice upon the debit side the scalps of investors innumerable.

The mine promoter, having staked out a claim near the Sinful Sucker, asseverates that since his own property answers to the name of Shameful Swindle, and since both names have an equally sibilant sound, therefore he is justified in expecting seven hundred ounces of gold per ton.

These statements, after due wrapping in the tinsel of high-sounding technical phrases, are served to the public through the daily press. The advertising artist spares no pains. He leaps from hyperbole to extravagance, from extravagance to nonsense. Beside his pyrotechnics, the cold and truthful estimate of a mining engineer looks appallingly flat. How long the public will continue to swallow the misstatements of the promoter we do not know. But we do know that the cooperation of every *bona fide* mining engineer, of all genuine mine operators, and of our technical educationists, is needed to educate the investors of Canada up to a point where they can distinguish the meretricious from the legitimate mining proposition.

EAST AND WEST

Could we acquire perspective by projecting ourselves into the future, and were we then to look back upon the past half decade, we would realize the tremendous import of our country's recent development. An added significance would then be given to the discovery of coal in the Western Provinces. The movement of population to the West, the re-population of the East by wisely controlled immigration, and the consequent readjustment of relations could be traced.

That the West will fulfil its rich promise of to-day, we do not doubt; but we believe, also, that the Maritime East will rehabilitate itself. Already it possesses every essential of natural prosperity. It suffers by contrast with the alluring West. But, all in all, the East is as rich in opportunity as is the West.

THE CHEMIST AND HIS OPPORTUNITIES

To-day the miner protects himself and cudgels operator and public with that most effective weapon, the strike. Elaborate and comprehensive labor organizations give the strike its efficacy.

No such weapon is in the hands of the technical chemist. After four college years—and three intervening summers of unremunerative toil—the chemist becomes an underpaid, overworked assistant in the laboratory of a metallurgical or mining plant. Here the deadening routine stultifies him, robs him of initiative. Conscientious and accurate work is expected of him. A mistake of his may cost his employers hundreds of dollars and him his position. He knows that many of the foremen on the plant get twice his pay and shoulder not a tithe of his responsibility. Also he is aware that cheap

chemists are replaced with ease. All of which does not bring inspiration.

The disabilities under which the chemist labors are due in small part to himself. He accepts wages that, in these days of constantly increasing cost of living, hardly suffice to feed and clothe him, and he is backed by no organization of his fellows. But upon the employer rests the larger share of blame. He looks upon the chemist as a superfluity. In engaging him he conforms to a certain growing custom, and that is all. It remains for him to extract from the chemist a maximum of work for a minimum of pay.

If the chemist proves to be a man of undoubted ability he is translated from the laboratory to some sphere of "practical" usefulness. But the chemist, *per se*, is a subordinate and humble official, who performs certain suspicious-looking operations and supplies figures for "practical" men to use.

As with all other abuses, this false conception of the chemist's functions can be corrected only by education. We talk largely and wisely of technical education for our rising generation. Our most startling need is technical and business education for our employers.

EDITORIAL NOTES

The JOURNAL extends its sympathy to McGill University in the very serious loss sustained by the burning of the Engineering Building. We note with pleasure that the Mining Engineering Department was not seriously damaged.

We wish to announce to our readers and the public generally that, in response to a very large number of enquiries, we are about to publish an authentic and up-to-date map of the Cobalt district. This map will have the merit of being both complete and accurate.

THE CANADIAN MINING JOURNAL will welcome letters from its subscribers on any subject pertaining to mining. Any requests for information of a technical nature will receive prompt attention. But it is undesirable that the JOURNAL should attempt to give information to individual enquirers about isolated mining camps; neither is it well that we should try to advise in matters pertaining to the stock market. There are many capable mining engineers and brokers whose business it is to advise in these matters.

A company has been organized in London, England, for the purpose of manufacturing "coalite," a smokeless fuel. The process of manufacture is yet a secret, but several plausible guesses have been offered. It is supposed that bituminous coal is subjected to treatment with superheated steam. The resultant "coalite" carries about 10 per cent. volatile matter and is perfectly smokeless. Petrol, for which the demand is increasing out of all proportion to the visible supply, is to be secured as a by-product. The process, it is claimed, will serve the double purpose of abating smoke nuisance and of relieving the petrol market. The project sounds somewhat too good to be true.

Annual Meeting of the Mining Society of Nova Scotia

The fifteenth annual meeting of the Nova Scotia Mining Society was opened in the Board of Trade rooms, Halifax, on Wednesday morning, March 27th, 1907. President Hayward's opening address, which is given below, was encouragingly optimistic.

After the opening address, Secretary Wylde's report was read, new members were elected, and the reports of various committees received.

On Wednesday evening the annual banquet was held at the Halifax Hotel. The banquet was attended by about 200 guests, and was a most unquestioned success. Indeed, the smoothness with which every feature of the dinner was carried out deserves more than passing mention. A military band provided most acceptable music. A paper by Mr. Robert Reford on "Transportation," and an address on "Municipal Ownership," by the Rev. Dr. Magill, were listened to after the dinner. On Thursday afternoon, March 28th, the annual session was concluded.

During the sessions the following papers were read and discussed:—

"Mine Pumping with Direct Connected Turbine Pumps," by P. H. Moore, M.E.

"Sinking and Timbering of the Allen Shaft," by H. E. Call, M.E.

"History of the Mining Society of Nova Scotia," by G. W. Stuart, M.E.

"Notes on the Property of the Seal Harbor Mining Company," by T. G. MacKenzie.

"Classification of Coal," by A. L. MacCallum, B.Sc.

"Coal Shipping Piers," by Hiram Donkin.

"Geological conditions of the Iron Ores of Nova Scotia," by Prof. Woodman.

"Coal Sampling," by Prof. Woodman.

"Londonderry Furnace Practice," by H. S. Badger.

"Sibley Mine, North Brookfield," by E. Percy Brown.

PRESIDENT—MR. C. J. COLL, STELLARTON, N.S.

The new officers elected are:—President, C. J. Coll, general manager Acadia Coal Company, Stellarton; 1st Vice-President, Dr. J. E. Woodman, Dalhousie College, Halifax; 2nd Vice-President, T. J. Brown, general manager Nova Scotia Steel & Coal Company, Sydney Mines; Secretary-treasurer, H. M. Wylde, Halifax. Council—Ald. J. A. Johnson, Dr. H. S. Poole, Prof. F. H. Sexton, G. W. Stuart, R. H. Brown, Hon. B. F. Pearson.

ADDRESS OF THE RETIRING PRESIDENT, A. A. HAYWARD.

Mr. Vice-President and Gentlemen:

This being the fifteenth anniversary of the Mining Society of Nova Scotia, as well as its fifteenth annual meeting, it is but natural that we should seriously consider the affairs of the Society by glancing back to the days of our first meetings, to the days of anticipations, to-day but partially realized.

To-day we ask ourselves: Are we fully satisfied with the results that have been obtained through organization? Have we, as members, given to the Society our individual and loyal support? Can we claim any individual improvement in ourselves because of our having helped to create and support the Mining Society of Nova Scotia? Has the Society been all you could desire, and has it accomplished sufficient to warrant its existence, and entitle it to respect and public recognition?

If anyone were to cast a stone into a body of water, of more or less extent, its influence would be recorded on shores far from the central point of disturbance. And just so can we liken the individual efforts of the gentlemen who compose this Society. Their individual efforts and experiences recorded in the transactions of the Society, and the discussions that have naturally followed, must have in some degree influenced and moulded public opinions.

Where are they, within, or, without, the circle of this Society that can truthfully say, the experience recorded in the form of papers by its members, during the years that have past, have not gone out from this humble centre and been far-reaching in their effects, and perhaps been instrumental in assisting some hesitating chap up the hill of uncertainty, and perhaps brought success where before failure seemed imminent? On the other hand, the recording of our experience may have been instrumental in preventing others from undertakings costly both in time and money, and possibly may have prevented disaster.

I venture to say there are none present, who review the days of the old four-stamp mill, with all its defects in construction and operation, but will admit the improved conditions in the stamp mills of to-day (at least in this Province) are not largely due to the recording of experiences of many of the men, who early in the history of this Society occupied prominent positions on its council. How many are there who recall the primitive mining, pumping and hoisting plants that dotted this Province from one end to the other, who do not feel the greatly improved conditions in these mechanical appliances are also in a large measure due to interchange of ideas and experience of members of this Society?

One might multiply at length, and still the result would be the same, and in the end we would conclude that apart from the social side of our corporate existence we have after all been some individual benefit to each other; and that perhaps some tiny wavelet of our experience, though enfeebled by its journey, may have reached some distant shore, and while not entirely adapted to its new environments may find lodgement in some sympathetic surroundings and bring forth abundant fruit in due season.

ROOM.

On behalf of the Room Committee, I have much pleasure in welcoming you to the new home of the Society, which, through your indulgence and generosity, has been secured and furnished at the expense of the Society, and the committee sincerely trust that their efforts will meet with your approval.

There surely should be a feeling of satisfaction and rest when we realize, after all our wanderings, that we are at last and for the first time in our history established in quarters befitting the dignity of a Society whose members represent the largest and most important portion of the industrial activity of the Province of Nova Scotia, the royalties from which largely defray the expenses of our political Government.

During the year the books belonging to the Society, which were stored at the Science Library, have been housed in cases in our new quarters, and one hundred and thirty-four new books added to the library. I consider the acquiring of a library most important, but in doing so it would be well not to duplicate books already in the Science Library.

BUILDING.

I would strongly recommend that the Society keep in mind the desirability, if not the necessity, of owning a suitable building in which to make a permanent home. I might say that I do not think it beyond the range of possibility that sufficient money might be donated for such a purpose, providing proper steps were taken to secure it. This work could best be done by the appointment of a committee, which I would strongly recommend.

AMALGAMATION.

I am also of the opinion that an amalgamation of the Engineering Society with that of the Mining Society of Nova Scotia would result beneficially to both, as the addition of their numbers would greatly increase the effectiveness of this Society, while both would receive largely increased benefits, and the operating expenses per member would be reduced.

It must be apparent that there is not sufficient room in this small field for two societies working along similar lines if they are to accomplish results.

By-Law.

By-law VII., regulating the election of officers, is ambiguous and should be repealed and another substituted. And again, the preparing of a slate by the council does not give satisfaction, conveying as it does the impression that the Society is run by a clique, which impression should not be allowed to continue if good government and harmony is desired.

Nominations should be made by members only. Nine members should compose the council, instead of six. This would give better representation to the country at large.

been satisfactory to the operator, and that the same degree of satisfaction has been enjoyed by the consumer. But this is purely a trade question, and cannot wisely be taken up in a Society representing the technical side of commercial life.

Gold Mining.

This industry, according to the official returns, was still on the decline during the year 1906, the total yield of gold being about 14,000 ounces, and which is about 1,000 ounces below the yield of 1905.

Several causes are by as many different people assigned as a

PAST PRESIDENTS AND SECRETARY OF NOVA SCOTIA MINING SOCIETY

Publications.

It has been proposed by the secretary of the Canadian Mining Society that your transactions be published in connection with those of the Institute, and that the Institute would be willing to do this at a cost not to exceed the present cost of the publication to this Society.

There should be considerable advantage by such an arrangement, but if any future plans for amalgamation with the Engineering Society are to be considered, it would be unwise to tie the Society up by considering such offer too hastily.

Coal Output.

The output of coal during the year 1906 was, roughly, 5,850,000 tons. The returns from this important industry, we trust, have

reason for the falling off in the yearly production, all having a certain amount of merit.

That there will ever be any material improvement in the general conditions of metalliferous mining in this Province, until the Department of Mines is divorced from the Department of Public Works, and a man placed at the head of the Mines Department who is not responsible to party politics, but is dependant upon his own ability, is a question this Society would do well to consider. And if the Society would adopt, as one of the things to be accomplished during the year 1907, the investigating of the decline in gold mining, I am confident the results would be found sufficiently encouraging to entitle us to bring the matter more forcibly before the Government.

IRON MINING.

This industry is receiving more recognition than in former years. There seems to be an increased demand for native ore. This is no doubt largely due to the increased bounty on iron made from native ore.

It was to be hoped that at least a part of the bounty now paid to the iron master would have been paid to the producer of native ores. Such a policy would encourage prospecting and stimulate the development of many encouraging locations.

TECHNICAL EDUCATION.

This most important subject has during the year occupied much time and thought, but not more than the subject deserved or required.

And after many trials and changes of position, the establishment of a school of technology in this Province, and by the Local Government, seems to be quite well assured.

To accomplish this, it was necessary to secure the co-operation of all existing educational institutions, who, by their moral support, made the situation possible, at the same time securing harmony. And as the gentlemen from the various institutions who by invitation met in these rooms last April, for the purpose of more fully considering the entire project, most earnestly supported the plan proposed by your committee, and by their support opened the way for the Government to safely and seriously consider the project, they naturally expected that when a final decision was reached, and before any bill was drafted and presented, all the contracting and interested parties would be called together again for consultation, and that a bill would not be constructed on the advice alone of gentlemen from any one of the institutions, and especially from the one which would, under the provisions of the bill, receive the larger amount of benefit. But such are the regrettable facts. The Society, however, has nothing to regret, as their actions have been open and above board. And now that their efforts are apparently to be crowned with success, the credit, if any is to be enjoyed, belongs to Mr. Alex. McNeil, the gentleman who first called to the attention of this Society the necessity of higher technical education for the young men of this, his native Province.

MEMBERS.

During the past year, while the membership of the Society has not largely increased, there has been no falling off, either in its members or their loyalty to the Society. There has not, however, been given that individual and collective support that was anticipated, and without which no Society can expect to accomplish high attainments. Yet, judging from past experience, had serious conditions arisen demanding united action and enthusiastic support, I am confident the opportunity to demonstrate the fervent loyalty of its members would not have been neglected.

Nevertheless, passive submission and willingness to allow things to drift when no clouds darken the horizon, are not conducive to good government; nor can the Society under such conditions be reasonably expected to ripen or mature the soundest and best fruits of progress and edvelopment.

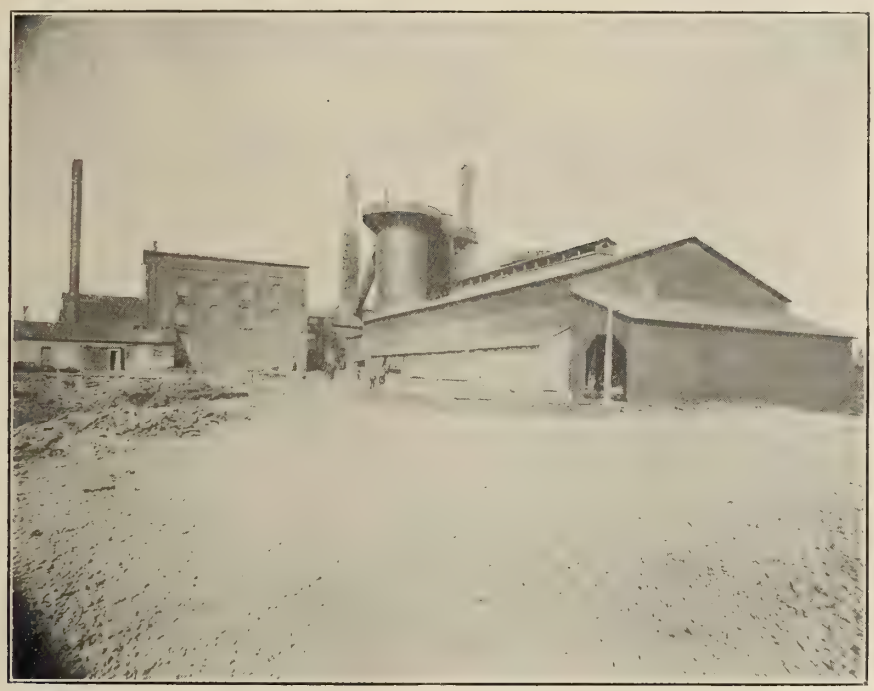
I therefore earnestly recommend that each and every member give to the incoming administration such support as he himself would expect were he similarly situated. And if this is done there need be no apprehension as to the results that will be accomplished by the Society.

There are many valuable objects which this Society would do well to interest itself in, and which are closely allied to the more complete development of this Province. It should not be necessary to wait until the opportunity overtakes the Society. But go and meet it half way; and, if necessary, go farther and create the opportunity, and by so doing establish the right of the Society to increased recognition and respect.

INTERIOR OF CAST HOUSE, LONDONDERRY, N.S.

SUBJECTS.

There is set forth, as one of the objects of the Society, the interchange of ideas by meetings, and reading of papers, and it is assumed scientific and practical results were expected to follow the reading of such papers and the discussions that would naturally follow. I would strongly advise a still closer application along such lines, rather than admission and discussing of commercial subjects, which only have tendency to lower the character and tone of your deliberations. Such subjects more rightfully belong to commercial associations and boards of trade. The dignity of the Society can only be sustained and successfully continued by keeping a watchful eye over its transactions and discussions.



A. A. HAYWARD,
President.

March 27th, 1907.

LONDONDERRY IRON AND MINING COMPANY

Snugly ensconsed at the foot of the Cobequid Hills, two miles off the main line of the Intercolonial Railway, lies the town of Londonderry. The town owes its being to two enterprises which are carried on within its limits—the blast furnace of the Londonderry Iron & Mining Company, and the pipe foundry of the Canada Iron Foundry Company. A brief description of the former industry is the object of this paper.

The history of iron-making in Londonderry would make a long and interesting narrative in itself. It may, perhaps, be the subject of a later article. For our present purpose it suffices to say that, after suffering many vicissitudes, the old Londonderry Iron Company shut down their works in 1896. Six years later—1902—a group of Montreal gentlemen, prominent among whom were Messrs. T. J., George E. and J. J. Drummond, and Mr. Edgar MacDougall, decided to take over the plant, mines and lands of the old company and start iron-making once more. As a result

BLAST FURNACE, CAST HOUSE AND ENGINE ROOM, LONDONDERRY, N.S.

of negotiations, the plant, iron mines, and about 33,000 acres of land, carrying much excellent timber and cordwood, became the property of the new Londonderry Iron & Mining Company.

The work of renewing the whole plant, of opening the mines, of remodelling and relining the furnace, and of repairing the old coke ovens, was begun in September, 1902. Adverse conditions of labor, weather and transportation made this an arduous task, and it was not until January, 1904, that the furnace was blown in.

Meanwhile, under the direction of Mr. J. J. Drummond, the furnace lines had been very radically altered. The bosh was lowered, and the lines were adapted to the reduction of the local ores. A coal-washer of the Robinson type was erected, and a battery of 30 bee-hive ovens added to the old ones, making a total of 97. The washer was designed to handle about 400 tons of dry coal per day.

A new cast-house for handling the pig iron was erected. The old English blowing engines, which had been in commission for over twenty years, were thoroughly repaired and gave good service from the start. The three Cowper stoves were also thoroughly overhauled and repaired.

A second, smaller blast furnace was pulled down. The erection and equipment of an excellent laboratory, of repair shops, car shop, machine room, blacksmith forges; opening the mines and shipping and stocking ore, coal and coke occupied the greater part of the year 1903.

After the furnace was "blown in," during January, 1904, there still remained much to be done. During that year a commodious office building was constructed, the contract being handled by Rhodes, Curry & Company, of Amherst, N.S. During 1905 and 1906 much prospecting and mine development was performed under the superintendence of Mr. W. F. C. Parsons, M.E. Early in 1903 shipments of red hematite from the Torbrook mines were started, and these have continued ever since. The company now owns and controls the Torbrook mines, in addition to its large Londonderry workings.

For a time limestone was purchased from Brookfield, South Maitland, and other points. But gradually the feasability of using the ankerite, which occurs in almost unlimited quantities on the company's Londonderry lands, was proven. This is now, and has been for the past few years, used exclusively as a flux.

Coal for coking purposes is supplied by the Intercolonial Coal Company of Westville, the Cumberland Railway & Coal Company of Springhill, the Acadia Coal Company of Stellarton, and the Port Hood-Richmond Railway & Coal Company of Port Hood. Shipments are made over the Intercolonial Railway to the Londonderry branch line.

Coke is purchased from the Intercolonial and Acadia Companies.

The Londonderry Company operates about ten miles of standard and narrow gauge railway. Its rolling stock includes two standard gauge and three narrow gauge locomotives, besides many flats and mine cars.

The local ores are limonites, specular and brown hematites, paints, siderite and ankerite. Mines are operated at Old Mountain, Cook's Brook, Martin's Brook, and Cumberland, which lie from one mile to four miles west of the furnace. To the east, and reached by the Intercolonial Railway, to East Mines Station,

thence by spur line to the ore trestles, are the East Mines workings. At all of these mines the above mentioned ores are found in varying quantities. At and near East Mines, immense bodies of clean ankerite have been proven.

At all of the mines brown ore, of varying degrees of hydration, is found. Old Mountain is particularly rich in specular.

It must not be overlooked that at many intermediate points between the east and west mines, rich ore has been found. There is, therefore, no cause to doubt the existence of a large, though irregular, body of ore, extending practically over all the distance between the extreme workings.

The Londonderry ores are phenomenally free from sulphur and phosphorous.

The Torbrook ores are red compact hematites and grey or red-gray magnetites. The former are rich ores, carrying about 1 per cent. phosphorous. The latter ores, though not so rich in iron, carry enough lime, in many cases, to be self-fluxing.

By a curious provision of nature, the Londonderry and Torbrook ores are mutually adapted to supplement each other's deficiencies in producing a foundry pig iron.

At this point it may be well to mention a few facts about the blast furnace, blowing engines, etc. The furnace stack stands 75 feet in height. Its bosh diameter is 17 feet, and its hearth measures 10 feet. The furnace lines, as mentioned before, were radically altered by Mr. J. J. Drummond. It is admirably adapted for the smelting of the local ores. Its capacity is about 120 tons in twenty-four hours.

The two English blowing engines, built thirty years ago by Daniel Adams, of Manchester, England, have given wonderful service. Recently they have been supplemented by a third large American blowing engine. Their united delivery at 28 revolutions is about 26,000 cubic feet of air per minute. The three Cowper stoves are soon to be supplemented by a fourth. Mr. G. C. Mackenzie, B.Sc., has been in charge of the furnace for the past three years.

In summer, Londonderry is one of the many unsuspected beauty spots which the traveller over the Intercolonial Railway misses. Soon after passing through the famous Wentworth valley, Londonderry Station, an unpretentious hamlet, is passed. Hidden behind it lie the green slopes of Folly Mountain and Old Mountain, between which nestles the Londonderry Iron Company's plant. On dark nights the dumping of molten slag illumines the whole countryside in a manner beautiful beyond description. Not only the hillsides and town, but the long stretch of fertile lowlands lying between Great Village and Truro are brilliantly lighted.

In former years Londonderry pig iron held a high place in the market. It was, indeed, acknowledged to be equal to the best Swedish. To-day Londonderry has no reason to abate by one jot this proud claim.

It will hardly be fair to close this paper without stating that it is the writer's intention to take up in later articles the geological and other features of this very interesting district. The purpose at present is merely to introduce the subject in a more or less superficial manner.

POWER FROM THE PIT MOUTH

By A. D. Ross

In the rapid settlement, growth and progress of Western Canada, there is a tendency to lose sight of the development—especially along industrial and manufacturing lines—that is taking place here in the east.

There are, for instance, here in Cumberland county, Nova Scotia, four or five coal mines in operation that ten years ago were not producing a ton of coal. They are now giving employment to hundreds of men, raising thousands of tons of coal, and are proving a rich source of revenue to the Province.

The Chignecto Mine, at Maccan, may be taken as a good example of what is being done in the way of developing the great Cumberland coal basin.

This mine was originally opened over thirty years ago by the Londonderry Iron Company, and was successfully operated for a number of years.

Owing to the unfortunate financial career of the above mentioned company, the mine was abandoned, and, for nearly a score of years, the once thriving hamlet of Chignecto remained a veritable "deserted village." The houses became untenanted. The mine filled with water. The place itself became a spot of dreariness and desolation.

About five years ago Senator Mitchell, of Drummondville, and his brother, Mr. David Mitchell, of the same place, with one or two other Montreal gentlemen, became impressed with the great future possibilities of the Nova Scotian coal areas. Mr. H. J. Logan, M.P. for Cumberland, induced them to pay a visit to a number of the mines of the county, and, as a result, they shortly afterwards acquired the lease of the Chignecto property, which embraces about 27,000 acres of the land surrounding the pit and the village.

Then followed the organization of the Maritime Coal & Railway Company, of which Senator Mitchell was president and Mr. David Mitchell was managing director.

The company had to face many difficulties. The mine had to be pumped out, and a railway line constructed to make connections with the I. C. R. The vacant houses had to be repaired, and many new ones built. All this was done, and much more. To-day Chignecto is a flourishing village, of from five to six hundred inhabitants. The mine is equipped with the most modern machinery. New stores and offices have been erected. The old houses have been repaired, and many new ones built, and the entire village presents a view of prosperity and contentment. Over one hundred and fifty men are now employed in this mine, and the daily output is steadily increasing.

The charter of the company was amended in the year 1906, and permission was secured from the Local Legislature to establish a central electric power plant at the mouth of the pit, for the purpose of supplying power and light to surrounding towns, the name of the company being at the same time changed to the Maritime Coal, Railway & Power Company.

It is expected that by the first of April the company will be in a position to supply the industries of Amherst, which is situated about nine miles from the mouth of the pit, with the necessary power to operate their plants.

A central station of brick and concrete has already been completed. The engines and boilers are now being installed. The concrete transforming station in Amherst is finished, and the "transformers" are expected to arrive this week. The wire line from the central to the transforming station is also completed. The power will be sent from the former to the latter at a voltage of eleven thousand, which will be reduced to twenty-two hundred at the transforming station and at that voltage supplied to the various industries.

It is interesting to note that this is the first plant of its kind established on the North American continent, and the third in the entire world.

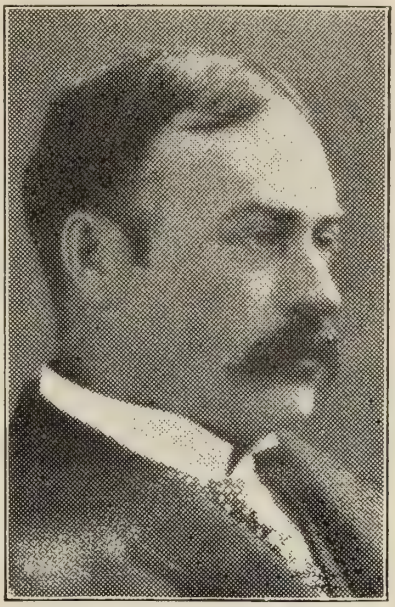
Anyone with any knowledge of coal mining is aware of the fact that there is always a large per cent. of refuse or waste coal for which no market can be obtained, and it is the purpose of this company to use this waste for the production of industrial power. Even if the marketable coal is used, the company contends that it is cheaper to transmit the power direct, rather that to ship the coal.

Amherst is one of the leading industrial centres of the Maritime Provinces. It is the home of flourishing workshops, which send their products all over this Dominion. The establishment of this power plant promises to bring about a new epoch in its history. Persons or companies desirous of starting new industries will not require a large expenditure for a plant producing

power. A wire from the transforming station with a motor will be all that will be required. Thus, the citizens of Amherst are looking forward with confidence to the establishment of many new industries in this town.

The company has met with such assurances of support that it has already placed an order to duplicate the original number of boilers and engines.

A coal company which has the enterprise to take up a scheme for the purpose of transmitting power direct from the mouth of the pit, instead of shipping the coal, is deserving of every success, especially when it is the first to undertake the pioneer movement.



DR. W. H. DRUMMOND

Dr. W. H. Drummond, distinguished as the poet of the "Habitant," died at Cobalt, Ont., on April 6th.

Born in County Leitrim, Ireland, in 1854, he was educated at Nohill, Ireland, and at the Montreal High School. In 1884 he graduated in medicine from Bishop's College, Lennoxville. He then practiced his profession in Montreal. For a time he occupied the chair of medical jurisprudence in Bishop's College.

Much of his time and energy he devoted to outdoor sport. He was passionately fond of the woods, and of all that an intimate knowledge of forest life implies.

It was, however, as a poet that Dr. Drummond made himself famous.

DR. W. H. DRUMMOND

Latterly, his mining interests in Cobalt took up a large portion of his time. His death has aroused universal sympathy.

A Comparison of University and Industrial Methods and Discipline

An Address Delivered by Mr. Frederick W. Taylor, President of the Society, at the Dedication of the New Engineering Building of the University of Pennsylvania.

The point from which I view college education is that of the employer, not that of the educator. I have had no experience with the difficult and complicated problem that faces the professors and the governing boards of our colleges. On the other hand, I have been engaged for years in organizing the shop, office, and commercial management of quite a wide range of engineering and manufacturing establishments. This has brought me into intimate personal contact with a large number of college graduates, and I have become acquainted with their strong points, which are many, and at the same time with a few of those points in which it would seem that as a class they might be improved. And in what I shall say I have principally in mind the preparation of young men for success in commercial, engineering and industrial enterprises; in other words, enterprises outside of the four learned professions.

I despise the pessimist who sees nothing but the defects and blunders of mankind; and the scold, whose pleasure it is to complain of all things as they are.

Let me say at the start, that without question, our college graduates as a class represent the finest body of men in the community. And as to the value of an engineering course for men in our profession, it has been shown through carefully gathered statistics, that within a few years after graduation the college-educated engineer far outstrips in position and salary his average competitor who comes up from the ranks.

It would be a much more congenial task to dwell upon this view of the profession, but something may possibly be gained by considering what has seemed to many of the friends of our young graduates to be the one defect which they practically all have in common.

For a period of from six months to two years after graduating they are, generally speaking, discontented and unhappy. They are apt to look upon their employers as unappreciative, unjust, and tyrannical, and it is frequently only after changing employers once or twice, and finding the same lack of appreciation in all of them, that they finally start upon their real careers of usefulness.

On the other hand, the attitude of employers toward young graduates is fairly expressed by the following written instructions given for the selection of quite a large number of young men to fill positions which presented opportunities for rapid development and advancement. These instructions were to give the preference—first, to graduates of technical schools; second, to the graduates of the academic departments; but to employ no college boy who had not been out for more than two years.

Why is it, then, that these young men are discontented and of practically little use during the first year or two after graduating?

To a certain extent this is unquestionably due to the sudden and radical change from years spent as boys almost solely in absorbing and assimilating knowledge for their own benefit, to their new occupation of giving out and using what they have for the benefit of others. To a degree it is the sponge objecting to the pressure of the hand which uses it. To a greater degree, however, I believe this trouble to be due to the lack of discipline and to the lack of direct, earnest, and logical purpose which accompanies, to a large extent, modern university life.

During the four years that these young men are at college they are under less discipline, and are given greater liberty than they have ever had before or will ever have again.

As to college discipline, it cannot be a good training for after life for a young man deliberately to be told by the university authorities that he can flagrantly neglect his duties sixty times in one term before any attention will be paid to it; while, if

in business, the same young man would be discharged for being absent two or three times without permission.

And, as to the freedom offered by the modern university system, it is not true that boys from eighteen to twenty years old have the knowledge and experience necessary to select a logical and well-rounded course of studies, and even if they had this wisdom, the temptation to choose those studies which come easiest is so strong that it would be unwise to throw upon them so great a responsibility. Nor does it appear wise to leave each student free to study as little or as much as may suit him, at times doing practically no work for days, and at others greatly overworking, with no restraint or direction except the round-up which comes twice a year with examinations. At the least, it must be said that in commercial or industrial life this undirected liberty will never again be allowed them.

During the past thirty years two radical changes have occurred in educational methods. The kindergarten and its accompanying ideas has come for the children, and for the young men has come the change from the college, with its one or two courses carefully selected and rigidly prescribed by the faculty, to the university with as many different courses as there are young men, and in which, under the elective system, each student is given the choice of all of his studies.

The fundamental idea back of the change from college to university is excellent; namely, that of providing a far greater variety in the courses to suit the different tastes and abilities of the students, and to especially prepare them for their future occupations. Accompanying, however, this great step in advance, and yet, so far as I can see, in no way logically connected with it, has come the false step of giving our young men in many ways a greater liberty than is allowed, on the whole, to any other class of active workers; and of handing over to them the final decision in a subject most needing a master mind.

Commercial, manufacturing, and other enterprises in which many men co-operate, are managed more and more by delegating all important decisions to a few men whose judgment has been trained through long experience, study, and observation in those matters which they are called upon to decide. Yet many of our universities are managed by giving over to the young man, under the elective system, the final decision as to what studies will best fit him for his life's work, although he has, of necessity, but the vaguest idea of the nature of the subjects which lie before him. It is almost like asking him to lift himself up by his boot straps.

I cannot but think that in changing we have modeled largely after the English and German universities, which, as we know, are influenced in their management by traditions handed down through several hundred years; and that in adopting the great university idea of a variety of courses, we have at the same time blindly accepted the foreign idea of the elective system accompanied by a lax discipline, both of which are better suited to medieval times, when each man worked for himself, than to the present day, when the road to success lies through true co-operation.

In this change, also, too great stress has been laid upon those elements leading to knowledge or book learning on the part of the student, and too little upon the development of his character.

The kindergarten also, which has proved so great a help in training the younger children, making them observant and giving them a certain control over themselves, has brought with it one idea which has wrought great harm, and yet this bad idea is in no way properly or logically connected with the underlying principles of the kindergarten.

Somehow the average kindergarten child gets a firm conviction that it is the duty of the teacher to make things interesting and amusing, and from this follows soon the notion that if he does not like his studies and fails to learn much, it is largely the teacher's fault. Now, whatever views the parents or the teachers themselves hold upon the duties of teachers, there is no doubt that the boys should have firmly in their heads the good old-fashioned idea that it is their duty to learn, and not that it is the duty of the teacher to teach them.

Along with the kindergarten plan of interesting and amusing children, the idea has taken firm hold in a large portion of the educational world that the child and young man should be free to develop naturally, like a beautiful plant or flower. This may again be an excellent view for the older person to hold, but it is a distinctly bad one for the young man to act upon. He promptly translates the idea of developing naturally into wishing to do only, or mainly, those things which he likes or which come easy to him.

Of all the habits and principles which make for success in a young man, the most useful is the determination to do and to do right all those things which come his way each day, whether they are agreeable or disagreeable; and the ability to do this is best acquired through long practice in doggedly doing along with that which is agreeable a lot of things which are tiresome and monotonous, and which one does not like.

Now neither the kindergarten idea, the university elective system, nor the lax college discipline tends to develop this all-important habit in young men.

True co-operation, co-operation upon the broadest scale, is that feature which distinguishes our present commercial and industrial development from that of one hundred years ago. Not the co-operation taught by too many among those of our trades unions which are misguided, and which resemble the co-operation of a train of freight cars; but rather that of a well-organized manufacturing establishment, which is typified by the co-operation of the various parts of a watch, each member of which performs and is supreme in its own function, and yet is controlled by and must work harmoniously with many other members.

It is a mistaken notion that character of this kind needed for successful co-operation is developed by the elective idea of allowing each boy to choose for himself those things which he will do. It requires far more character to do successfully those things which are laid out for one by a wiser man than to do only what one likes, and in modern co-operation, while the work of each man is modified and more or less controlled by that of others, there is ample scope left for originality and individuality. We must remember that of all classes in the community, college boys are being trained to fill some day the position of leaders in the co-operative field. And there is no fact better established than that the man who has not learned promptly and fully to obey an order is not fit to give one.

An examination of the studies chosen by boys in the university academic departments will show that the logic and motive back of about one-half of the students is that of obtaining an easy course, and even the better students show generally a lack of clear-cut logical purpose in their selection. In their case, the studies are chosen because the young man likes or is interested in the subjects, or because they come easy to him, rather than because they give a well-rounded and balanced course with a distinct logical purpose. The loose, flabby, purposeless courses chosen by fully one-half of the students under the present system furnish but poor mental diet.

Why cannot all of the good features of the elective system be better attained by permitting each young man to choose in general the objects or purpose for which he wishes to educate himself, and then leave the entire course of studies to the one or more professors in the faculty who are especially fitted to plan a complete and logical course in the chosen field? Let the young man say where he wishes to go, and let the faculty tell him the road he is to travel to get there.

As to the object of college life, some boys are sent to the university to learn how to mingle with men, and to form friendships which shall prove useful and agreeable in after life. Some go there to amuse themselves, and some to get the standing given by a college degree.

Something can be said for each of these objects. Is not the true object of all education, however, that of training boys to be successful men? I mean men successful in the broadest sense, not merely successful money-getters. Successful, first in developing their own characters, and second, in doing their full share of the world's work.

Young men should not come to college mainly to get book learning or a wide knowledge of facts. The successful men of our acquaintance are, generally speaking, neither learned nor men of great intellect. They are men, first of all, possessed with an earnest purpose. They have a certain all-round poise or balance, called common sense. They have acquired through long training those habits both mental and physical which make them masters over themselves; and at all times they have the firm determination to pay the price for success in hard work and self-denial.

It is singleness and earnestness of purpose that constitute the great motive power back of most successful men, and it is a notable fact that the moment a young man becomes animated with such a purpose, that moment he ceases to believe in the elective system, and in the loose college discipline.

In all earnest enterprises which the students themselves manage, they throw the elective system to the winds, and adopt methods and a discipline quite as rigid as those prevailing in the commercial and industrial world.

The boy who joins the football squad is given no sixty cuts a season, nor is he allowed to choose what he will do. He does just what someone else tells him to do, and does it at the time and in the manner he is told, and one or two lapses from training rules are sufficient cause for expulsion from the team or the crew.

I say in all seriousness that, were it not for a certain trickiness and a low professional spirit which has come to be a part of the game, I should look upon football and the training received in athletics as one of the most useful elements in a college course, for two reasons: First, because in it they are actuated by a truly serious purpose; and second, because they are there given, not the elective idea of doing what they want to, but co-operation, and co-operation of the same general character which they will be called upon to practice in after life.

Is not the greatest problem in university life, then, how to animate the students with an earnest, logical purpose?

In facing this question I would call attention to one class of young men who are almost universally imbued with such a purpose; namely, those who, through necessity or otherwise, have come into close contact and direct competition with men working for a living. These young men acquire a truly earnest purpose. They see the reality of life, they have a strong foretaste of the struggle ahead of them, and they come to the university with a determination to get something practical from the college training which they can use later in their competition with men.

They are in great demand after graduating, and as a class make themselves useful almost from the day that they start in to work.

Neither their earnestness of purpose, however, nor their immediate usefulness, comes from any technical knowledge which they have acquired while working outside of the university, but rather from having early brought home to them the nature of the great problem they must face after graduating. Nothing but contact with work and actual competition with men struggling for a living will teach them this. It cannot be theorized over or lectured upon, or taught in the school-workshop or laboratory.

I look upon this actual work and competition with men working for a living as of such great value in developing earnestness of purpose that it would seem to me time well spent for each student, say, at the end of the Freshman year, to be handed over by the university for a period of six months to some commercial, engineering, or manufacturing establishment; there to work as an employee at whatever job is given him, either manual or other work. He should have the same hours and be under the same discipline as all other employees, and should receive no favors. Moreover, he should be obliged to stay even a longer time than six months, unless he has in the meantime given satisfaction to his employers.

I believe that there would be but little difficulty in obtaining the co-operation of our business and manufacturing establishments in carrying out this plan, and the University of Pennsylvania, situated as it is in the foremost manufacturing city in this country, would have an especially good opportunity to inaugurate it.

My belief in the benefits to be derived from doing practical, everyday work early in the college course is not the result of a theory. It is founded upon close observation and study of young men who have had this experience, and also upon a vivid remembrance of breakfasting each morning at five-thirty and starting to sweep the floor of a pattern shop as an apprentice some thirty-two years ago, after having spent several years in preparing for Harvard College. The contrast between the two occupations was great, but I look back upon the first six months of my apprenticeship as a patternmaker as, on the whole, the most valuable part of my education. Not that I gained much knowledge during that time, nor did I ever become a very good patternmaker; but the awakening as to the reality and seriousness of life was complete, and, I believe, of great value.

Unfortunately, laboratory or even shop work in the university, useful as they are, do not serve at all the same purpose, since the young man is surrounded there by other students and professors, and lacks the actual competition of men working for a living. He does not learn at college that on the whole the ordinary mechanics, and even poorly educated workmen, are naturally about as smart as he is, and that his best way to rise above them lies in getting his mind more thoroughly trained than theirs, and in learning things they do not know. All of this should be taught him through six months' contact with workingmen.

Let me repeat, in conclusion, that our college graduates are the best picked body of men in the community. Yet I believe that it is possible to so train young men that they will be useful to their employers almost from the day that they leave college; so that they will be reasonably satisfied with their new work, instead of discontented; and to place them, upon graduating, one or two years nearer success than they now are; and that this can be best accomplished by giving them an earnest purpose through six months' contact early in their college life with men working for a living; by rigidly prescribing a course of studies carefully and logically selected, and with some definite object in view, and by subjecting them to a discipline comparable with that adopted by the rest of the world.

Philadelphia possesses and is proud of the most notable group of medical schools in this country, and among these that of the University of Pennsylvania unquestionably stands first.

The Philadelphia lawyer has been proverbial for his knowledge and shrewdness for more than a century, and this reputation can be traced largely to the fundamental training given in the law school of the University of Pennsylvania.

Philadelphia is the centre of the largest and most diversified group of engineering and manufacturing enterprises in this country. The Engineering Schools of the University of Pennsylvania already stand high; but it seems to me that the opportunity lies open to them, even more than to their famous medical and law schools, to stand at the very top. This magnificent building, equipped as it is with the latest and best of everything, is the first and a great step toward this end. But after all, your largest possibility, and one which does not exist for, and cannot be created by any other American university, lies in the opportunity for bringing your students into close touch and personal contact with the men who are working in and managing the great industrial establishments of Philadelphia.

ELDORADO COPPER MINE

By A. G. Burrows.

The Eldorado Copper Mine is situated one-half a mile from the village of Eldorado, in the township of Madoc, Hastings county. As the Moore and Coe Mines, it was operated for some years as an iron property, from which a large quantity of excellent hematite was shipped to Ontario smelters. The iron ore was obtained from an open cut and pit, the deposit being apparently a vein associated with greenstone, with strike east and west and dip about 60 degrees north. This iron ore has occurred as a large gossan capping, overlying sulphides of copper and iron. The predominating rock in the vicinity is crystalline limestone.

The Copper Deposit.

At the bottom of the open pit a shaft was sunk to a depth of 75 feet, with cross-cuts and drifts at different levels. At a depth of 35 feet in the shaft there are 105 feet of drifting; at 55 feet, 170 feet of drifting; and at 75 feet, 175 feet of drifting. At the last depth the shaft was discontinued, and mining has since been confined to sinkings in the ore body, which occurs as a shoot, with a dip east and north. Sinking has now reached a depth of 300 feet from the surface at the inclination. The vein matter is chiefly copper pyrites, iron pyrites, hematite, greenstone and calcite, but quantities of chalcocite, bornite and tetrahedrite have been encountered at various depths in sinking.

At the lowest workings the vein is about seven feet in width, with a well-defined foot wall of crytsalline limestone. The hanging wall is granite. In contact with the foot wall is a streak of copper pyrites, bornite and tetrahedrite, and beyond this a mixture of copper pyrites, iron pyrites, hematite and greenstone. At one point a width of about four feet of almost solid copper pyrites was mined. To the south of the main pit, at the surface, may be seen quantities of malachite, which would indicate copper ore. But this occurrence is not associated with the copper in the main workings, where no green carbonates have been seen.

Very little drifting has been done, practically all the mining being confined to sinking on the copper lead, which inclines to the east. The hanging wall is supported at short intervals by very heavy stulls. The ore is raised by means of a well-constructed skipway on the foot wall of the deposit, on which the iron buckets are hoisted to the bottom of the old iron pit, and from here by a vertical hoist to the surface, where the ore is partially sorted before going to the smelter. The workings are reached by a stairway with railing, in the open pit, and by ladders in the shaft. The mine is kept free of water by a Cameron sinking pump, of a capacity of 3,000 gallons per hour. The discharged water is led to storage tanks, and is afterwards used in the boilers and for other mining purposes. Sinking is done by Mac machine drills, driven by compressed air.

Equipment.

The plant consists of an Allis-Chalmers copper smelter, one 120 horse-power return tubular boiler, one 90 horse-power boiler, one half of a ten-drill air compressor, one three-drill air compressor, one seven horse-power engine, operating a 75-lamp dynamo; one 18 horse-power engine, operating the Connellsville blower at the smelter; two compound steam hoists, of 10 and 12 horse-power, also a small hoist underground, for raising drills, etc.; one diamond drill outfit. The surface workings are lighted by electricity.

Buildings.

The power plant, blacksmith and machine shop are under one roof. Other buildings include a 30 x 35 office and laboratory, well fitted and steam heated; a 41 x 35 smelter building, and a large, commodious boarding house.

The Smelter.

The smelter is a 48-inch round, water jacket furnace, with solid cast steel crucible, and has a capacity of 50 tons of ore in 24 hours. It is located to the south of the ore dump, and on the face of a hill, affording good facilities for charging, and disposing of the slag. The ore is very basic, as will be seen from the following analysis, by the writer, of a high grade sample:—Copper, 16.40 per cent.; iron, 24.90 per cent.; sulphur, 28.54 per cent.; ferric oxide, 17.70 per cent.; lime, 1.00 per cent.; magnesia, 2.12 per cent.; silica, 5.58 per cent.; undetermined, 3.76 per cent. The only flux required for this ore is silica, which is very conveniently obtained from a quartz vein on an adjoining property. The quartz in this deposit is mined by hand drilling, and raised by a horse whim. An ordinary charge for the furnace is the following: Seven hundred and fifty pounds ore, 130 pounds coke, 110 pounds low grade matte, 135 pounds silica, 175 pounds slag. The ore is given no preliminary roasting, but is fed directly to the furnace, the sulphur, in excess, acting as fuel. The charge fuses quite readily, and the matte and slag flow continuously into a three-ton fore hearth, from which the matte is drawn at intervals. The overflowing slag is received in unlined iron settling pots, and conveyed to the slag dump. The slag is usually very low in copper, less than .02 per cent., and is essentially an iron silicate.

Shipping matte of grade 40 to 50 per cent. copper is made on the second run, and has been made on one run on high grade ore. So far, about 260,000 pounds of shipping matte have been produced. This is shipped to New Jersey, to be further refined. An analysis of matte, by Ledoux & Company, shows the following composition: Copper, 48.04 per cent.; iron, 25.04 per cent.; sulphur, 24.05 per cent.; nickel and cobalt, 0.02 per cent.; antimony, 0.02 per cent.; arsenic, 0.02 per cent.; silver, 2.6 ounce per ton; gold, 0.13 ounce per ton.

Forty-five men are employed at the mine, and are about equally divided, underground, on the surface, and at the smelter. Laborers receive $1.50 per day; drillers, $2.00; smeltermen, $1.75 to $3.00.

The property is owned by the Ontario Copper Company, and leased to the Medina Copper Company, of which Cole Saunders, New York, is president.

ELDORADO SMELTER AND DUMP

The mine is in charge of G. H. Hambly, to whom the writer is indebted for much information.

The loading dock of the company, on the Central Ontario Railway, is only a quarter of a mile from the mine shaft. It is the intention of the company to do some custom smelting of ore from prospects in the vicinity, as there are several promising quartz-copper properties, which ore would smelt excellently with the basic ore, on which the furnace is at present running.

The region about Eldorado is very prolific in mineral wealth, and, in a radius of ten miles, there are gold, silver, copper, lead, mundic, and arsenic properties, not to mention deposits of talc, actinolite, etc.

SLAG CEMENT

The manufacture of cement from blast furnace slag is perhaps the most interesting industry that has sprung from the establishment of the Dominion Iron and Steel Works at Sydney.

Soon after iron smelting was commenced in Sydney it was observed that the blast furnace slag was exceptionally favorable for the manufacture of cement, being very low in sulphur and magnesia, and very rich in lime. Encouraged by the success of similar enterprises elsewhere, more especially that of the Illinois Steel Company, and by the excellence of the slag, as well as by the remarkable advantages of Sydney as a distributing point, a company, known as the Sydney Cement Company, Limited, made an arrangement with the Steel Company to use their slag, and undertook the manufacture of cement.

Before ordering the machinery, works in Germany and the United States were visited, and the best experts were consulted, so that the plant has been designed in the light of the most advanced knowledge of the industry.

The works are situated at the junction of the Intercolonial and Sydney and Louisburg Railways, close to the Intercolonial Railway passenger station, Sydney.

The plant consists of two Ruggles-Coles rotary dryers, one set of style A Allis-Chalmers rolls, three Prosser-Krupp tube mills, Robb-Armstrong Corliss engine, Robb-Mumford boilers, and all necessary storage bins, slacking pits with mechanical screens, etc.

The buildings, including stock houses, but with the exception of the cooperage, are built of concrete and steel. Trestles for dumping raw material are also of concrete and steel.

There is a well-equipped physical and chemical laboratory, in charge of a competent chemist, with necessary assistants, and raw materials and finished product are carefully sampled and thoroughly tested and analyzed.

Samples for some of the tests are taken every hour, night and day, from each mill.

Lime of excellent quality is obtained from Marble Mountain, Bras D'or Lake.

The capacity of the plant is over 500 barrels per day.

The product of this company was put on the market two years ago, has been used for all the purposes for which Portland cement is used, namely, foundations, marine work, pavements, reinforced concrete, building blocks, etc., and has for all purposes been found completely satisfactory.

This cement has found its way into Mexico and Cuba; as far as Montreal westward, and Newfoundland eastward.

The high grade raw material used, and the care taken in manufacture, following the most recent knowledge of the industry, have resulted in a product which fully meets all the requirements of a high grade hydraulic cement.

With cheap raw material and fuel, it seems likely that the Sydney Cement Company will, for some time to come, control the market of Eastern Canada.

Sydney's geographical situation gives the company a position unrivalled for an export trade for as much of its output as may not be required for the home market.

Breathing Apparatus for Rescue Work in Coal Mines

By F. W. Gray.

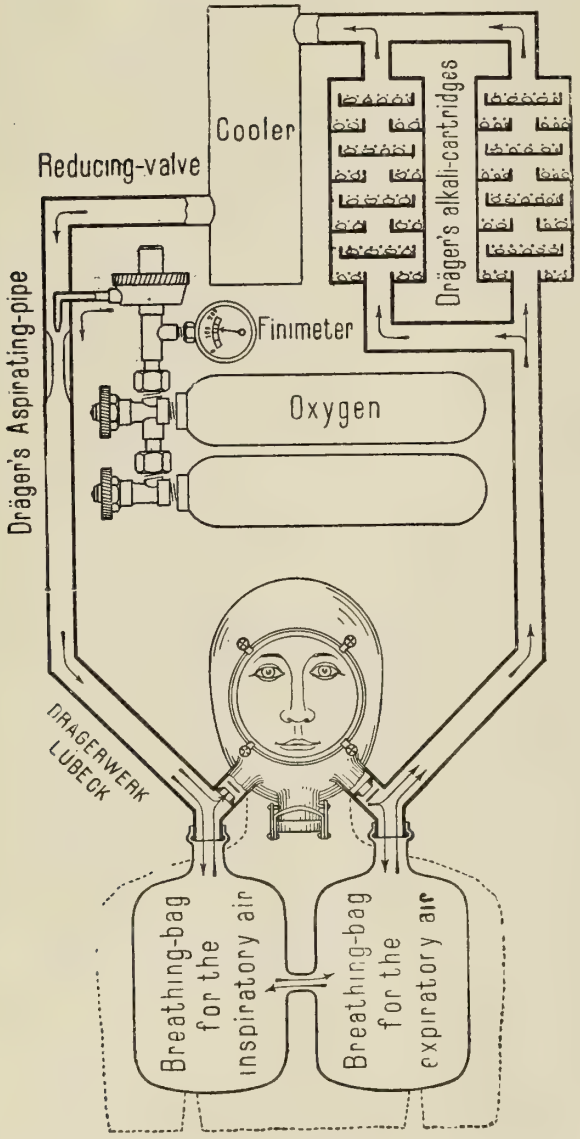
Next to the prevention of colliery explosions ranks the work of rescuing the survivors and the recovery of the mine after these apparently unavoidable catastrophes, and nowhere in the annals of mining heroism, numerous as they are, can there be found such deeds of daring and self-sacrifice, too often futile and of no avail. How many would-be rescuers have fallen victims to the manifold dangers that present themselves after the blast has passed, and how many men who have survived the explosion die among the gases that follow?

In view of these too obvious facts, it is a little surprising to find how little is known amongst the average mining community about the proved and tested appliances now on the market, by means of which men can live and work in irrespirable and poisonous atmospheres, and a brief account of the evolution and present status of these so-called "breathing apparatus" may be of interest.

Although it is only within the last decade that such apparatus has been made really practical, the idea is by no means a new one, as may be found by reference to the literature of the subject in the Transactions of the Institution of Mining Engineers, ranging over the past sixty years. A complete historical summary was given by Mr. W. E. Garforth in his paper, read before the general meeting in London, June, 1906.*

Between 1846 and 1874 several devices were tried, most of them depending on a reservoir of atmospheric air. The first person to adopt the accepted principle of the modern appliance appears to have been Mr. Henry Fleuss, who, in 1880, introduced an arrangement, the principle of which he explained as follows:—

"The wearer breathes his own breath over and over again, the carbonic acid being absorbed from it at each expiration, and the requisite amount of oxygen being restored, the revivified air is fit to be again inhaled in the form of pure air."



*Note.—"A New Apparatus for Rescue Work in Mines." Trans. Inst. M. E. Vol. XXII., p. 625.

For some reason or other, Mr. Fleuss' device appears to have been practically forgotten, but it was the forerunner of the perfected modern appliance, notably the "Pneumatphore" of Walcher von Uysdal, the "Meyer," "Giersberg," "Shamrock" and "Dräger" types, and the "Weg" apparatus, recently introduced by Mr. Garforth, all of which more or less resemble each other, and differ only in modification and perfection of detail.

The "Dräger" apparatus consists of two bags carried on the chest of the wearer, and communicating with the mouth, one bag being intended to hold the expired breath, and the other the revivified air intended for breathing. The breath exhalations pass along a circulating pipe, and diffuse through a series of flat dishes covered with coarsely granulated hydrate of potassium or sodium, so arranged as to give the greatest possible amount of absorbent surface. This arrangement may be very happily likened to a mechanical lung. Leaving the "lung," or potash cartridge, as it is called by the makers, the air, relieved of its carbon dioxide, passes through a cooler, and thence into the aspirator pipe. (See diagram.) What may be called the motor of the apparatus is supplied by an injector communicating with two cylinders containing oxygen compressed to 250 atm. It is claimed by the makers that this arrangement will supply 3,000 cubic inches of breathing air per minute, under a pressure of four to five inches of water column, over a period of two hours. The apparatus is constructed with either one or two cylinders as desired, and weighs, complete with the smoke helmet, 28 pounds and 36 pounds, respectively. It can also be obtained without the helmet, fitted with a regulation mouthpiece and smoke goggles. Most authorities seem to advise strongly against the use of a helmet where it can be avoided. It has a tendency to heat the head and cause discomfort, but it is mostly to be objected to in that it cuts off the wearer from outside sounds and limits his area of vision, giving him a feeling of isolation. Anything that is apt to cause nervousness in the

wearer, and thereby increase the rate of respiration, causes an unnecessary waste of both energy and oxygen.

The "Weg" apparatus has been introduced by Mr. W. E. Garforth as the result of many years' experience in rescue work, in which he has always taken an enthusiastic interest. In 1901 Mr. Garforth erected an experimental gallery, in which he reproduced as nearly as possible the conditions of a mine after an explosion by strewing the floor with broken stone from the ripping, and arranging props and broken timber to imitate mine falls. The whole gallery could be filled with noxious gases, and was fitted with inspection windows, to enable onlookers to see the exercises inside. Various apparatus have been subjected to severe and actual tests in this gallery with a view to discover their imperfections, and Mr. Garforth has collected most valuable data from the results obtained.*

Mr. Garforth's arrangement is the result of these experiments, and its chief feature is called by him "a lung-governing valve." He states that, as the action of the lungs is intermittent, the supply of oxygen should be the same, and that by this valve the supply of oxygen "is governed by the action of the lungs, in the same way that the supply of steam is regulated by the governor balls actuating the throttle valve of an engine." The mouthpiece is arranged something after the fashion of a dentist's bag for administering gas to a patient, and has the advantages of the helmet without its drawbacks, inasmuch as the ears and head generally are left quite free. One man wore this apparatus for three hours and ten minutes, during which time he walked and crawled about two and three-quarter miles, resting a little more than half an hour during this time. The writer is not aware whether Mr. Garforth's apparatus is yet being manufactured commercially.

A device that differs radically in principle from those previously mentioned is the "Pneumatogen," the invention of Prof. Dr. Max Bamberger and Dr. Friedrich Böck, of Vienna. In this arrangement no oxygen cylinders are used, the necessary oxygen being obtained by the reaction consequent on the exposure of sticks or "cartridges" of potassium-sodium-peroxide to the breath exhalations, the carbon dioxide and water being absorbed and oxygen given off. The apparatus thus generates its own oxygen as required, and has the advantage that an increased rate of respiration automatically increases the yield of oxygen. The absence of the oxygen cylinders very materially lessens the weight, and avoids the necessity for the numerous pressure-reducing and other valves that are a feature of the cylinder type apparatus. The whole thing is most compact and simple, very light, being only about one-fourth of the weight of the cylinder machines, and the first cost is not more than half. Its chief drawback appears to be the high temperature of the evolved breathing mixture, which, however, does not seem to cause discomfort. The makers admit the high temperature of the air supplied, but they claim it is dry and not uncomfortable to breathe, and they prefer to have it so rather than complicate the device by a cooling arrangement. The working cost of the "Pneumatogen" is somewhat higher than the cylinder type machines, but it is hoped, with an increased demand for potassium-sodium-peroxide, this will be considerably reduced. At present this compound is not manufactured on a large scale, and is in consequence rather dear. The "Pneumatogen" appears to be a decided step in the direction of simplicity and cheapness.

An arrangement of very recent date is the "Aerolith" liquid air breathing device, described within the past month before several of the mining societies of England by Dr. Simonis. It has excited favorable comment, but as yet no detailed description is to hand.

Enough has been said to show that there are at present available several devices of practical utility for supporting life in noxious atmospheres, but these devices are of no real use, and indeed are dangerous, unless the wearer is quite accustomed to their use. This state can only be obtained by regular practice under conditions as nearly as possible resembling those for which the apparatus is intended. Even with pure air to breathe, the work that has to be done by exploring and rescue parties after a mine explosion is most arduous, and to be really efficient the wearer of a breathing apparatus must have full confidence in it, and must have had sufficient practice to enable him to wear it with unconscious ease and without any fear of "funk." The provision of a practice room is, therefore, quite necessary, and it should be so arranged that it can be filled with unbreathable gases, and fitted with observation windows, through which to watch those practising. Only in this way is it possible to weed out those who, either from physical unfitness or nervousness, are unsuitable for the work. There is also a "knack" in breathing that must be learned in order to get the most efficient and economical work out of the apparatus and oneself.

On the continent and in England so-called "Rescue Stations" have been erected to serve a group of collieries.*

A typical building of this kind consists of a practice room as above described, an apartment fitted with racks for the proper storing of the apparatus and its accessories, where they may be kept in immediate readiness for use, a meeting or club room, and

*Note.—"Experimental Gallery for Testing Life-saving Apparatus." Trans. Inst. M. E. Vol. XXII., p. 169.

*Note.—"The work of a Joint Colliery Rescue Station." M. H. Habershon. Trans. Inst. M. E. XXI., p. 100.

dwelling rooms for a resident caretaker, who is also instructor. Gangs of colliery officials, and the more intelligent workmen, are systematically trained in such a manner that those acquainted with the intricacies of any one mine are not all of them underground at any one time. The gangs are composed usually of a captain or leader, whose sole business it is to direct operations. He can exchange pre-arranged signals by means of a pneumatic horn, or by waving lights, and he carries nothing else. He is the eyes and the ears of his party, who look to him for guidance. He has a deputy, or lieutenant, and the other three compose the rank and file. Discipline plays an important part in this work, and no time should be grudged to drill.

These parties can carry with them portable air stoppings, supplies of oxygen for the resuscitation of those poisoned by carbon monoxide, stretchers, etc. Their work would consist in the rescue of those who had survived the explosion, the quick restoration of the ventilation, and the obtaining of definite information as to the state of affairs underground. Generally they would act somewhat as the cavalry *vedette*.

DRAGER BREATHING APPARATUS IN USE.

Although too late to save any lives, breathing apparatus of the "Shamrock" and "Dräger" types, and several "Pneumatogens" were successfully used in the repairing and recovery of the mine at Courrières after the memorable explosion there. Just recently thirty-nine men were saved by the "Dräger" apparatus at the Redan Mine, Saarbrüc-ken, Westphalia. They were got out of the mine after the first blast. Later another blast occurred, which would certainly have killed them all, had not the presence of the breathing apparatus rendered it possible to rescue them.

The usefulness of the breathing device is not, however, limited to rescue work after explosions. They can be used to much advantage in the initial stages of a mine fire. Very often blinding volumes of acrid smoke render it impossible to approach what is only a small blaze, easily extinguishable at close quarters, but which speedily develops into a serious and uncontrollable fire. Equipped with these devices, men can penetrate the smoke and reach a point where their exertions will tell. In the case of gob fires also these devices should prove very useful.

Herr Meyer's paper on the actual use of the "Shamrock" apparatus at Courrières by the German Brigade will repay perusal, and is fully illustrated.*

A complete equipment of electric hand lamps is an indispensable part of a rescue station, for of course the ordinary safety lamp is useless under the conditions for which the rescue apparatus is designed. These lamps must be kept ready at all times for immediate use. The utility of all the apparatus in connection with a rescue station hinges on its readiness for use at a moment's notice. Explosions come unheralded, and time is then both life and money. The importance of this point is too obvious to need enlargement. Apart from the undoubted utility and additional safeguard that a properly arranged and equipped rescue station affords, the discipline and drill of the training process, especially when it is combined with instruction in first aid ambulance work, infuses a spirit of organization and *cameraderie* that should prove very useful in a time of emergency, particularly where one rescue station is the centre for a group of mines. Such an organization might very well be incorporated with, or might work in harmony with, the colliery fire brigades. Viewed in the light of an insurance premium, expenditure in this direction would appear well justified, merely from a monetary standpoint.

GRAPHITE IN CANADA

(From Our Special Correspondent.)

Although this mineral is in great abundance in the crystalline formation in this country, still until a few years ago little importance had been attached to its occurrences. The bulk of the world's supply of graphite is chiefly derived from Ceylon, and in a lesser degree from Bavaria and Austria, Siberia and the United States, but lately great attention has been paid to Canadian deposits. This is evidenced by the fact that not less than three big graphite mills are in course of construction, and this is specially due to the untiring efforts of some enterprising Americans.

The mode of occurrence of graphite shows great variety, affording quite a study in itself. Although the technical importance of the mineral has been recognized for a great many years, and although the study of the various occurrences has been facilitated by increased mining development, our knowledge regarding the geological position and origin is still imperfect.

In a general way we may distinguish in our Canadian occurrences two different modes of depositions, the vein-like and the disseminated. In the first mode of occurrence, that of veins, the graphite constitutes the filling of veins and cracks in gneiss, crystalline limestone, pegmatite and granular eruptive rocks. Both hanging and foot wall are easily discernable, and the direction of the vein is independent of the strike of rocks traversed. We find instances of this in the Grenville and Calumet deposits, near Buckingham and Templeton.

Though the vein form frequently occurs at most of the points where attempts to work the graphite have been made, and has shown in such cases a mineral of great purity, the uncertainty of such deposits is so great that the employment of capital on a large scale in this mode of occurrence would scarcely be warranted.

The disseminated variety is less desirable from a mining point of view than the vein-like occurrence, since it involves the handling of a very large quantity of rock, depending upon the percentage of graphite contained therein, in order to obtain the pure article. However, it must be mentioned that most of the successful mines in Canada have been working on deposits of this character, the vein occurrences as a rule being of too limited extent to render their commercial extraction lasting and profitable.

This disseminated variety occurs as scattered scales or plates through certain portions of the gneiss, limestone or other strata; it occurs often in proximity to veins, and in these cases it is

*Note.—"Experiences with the German Rescue Party at Courrières after the Explosion." Trans. Inst. M. E. Vol. XXXI., p. 575.

supposed that the graphite has thence been distributed along the planes and fissures of the rock in contact from the veins itself. This has been more particularly observed where the adjoining rock is a mica gneiss, but similar occurrences are also found in limestone and other rocks belonging to the older series.

The most important deposits which have been worked for many years are those located in the country north of the town of Buckingham. Here quite a large number of deposits show the disseminated variety, and, on account of the very large demand for flaky graphite—a grade which is mostly used in the manufacture of crucibles—the mines in that district have of late displayed great activity. In addition to the several mills which are being worked in the district, the Diamond Graphite Company,

The new mill building measures 72 x 26 feet square, and is fed from the mines by an inclined tramway. A new departure in the construction of this mill has been made by the division of the same into several sections, each section being driven by an electric motor. The motive power in the beginning will be steam, but later electricity will be generated at the big Lievre River Falls at Masson, at a distance of eight miles, and transmitted to the mine. The treatment of the rock will be as follows:—

The ore is first calcined in a roast kiln; it passes then through a Blake crusher, crushing rolls and sizing sieve, and, after it has been crushed for the second time in rolls, it is delivered to a series of Krom air jigs, which do the principal work by separating the flakes from the rock matter. The separated flakes then

BLACK LAKE, QUEBEC.

composed of New York capitalists, has almost finished a 100-ton concentrating plant, while another mill of the same capacity is in course of construction. The deposits which this company operates are situated five miles north of Buckingham, on the left bank of the Gatineau, and, although they have been known for a great number of years, still it seems that their great economic importance was overlooked.

The area which contains these large bodies of the disseminated variety, and which has been thoroughly tested by twelve-foot drills and much prospecting and development work, has the shape of a triangle, with side lines of 1,000 feet, 800 feet and 300 feet. The country rock is a rusty gneiss, which becomes schistose and laminated in the graphite deposits. The graphite rock, according to many tests, is supposed to carry as an average 12 per cent. flake.

pass through the polishing and sizing department, after which they are supposed to be ready for the market. It is believed that the mill can treat 100 tons in 24 hours, and that the output will range between six and eight tons of flake graphite per day (24 hours).

Another American company is operating in Calumet, a station on the Canadian Pacific Railway, just half way between Montreal and Ottawa. The graphite deposits worked by this company belong to both the vein-like and disseminated occurrences, the former having a width of from eight to eighteen inches. A shaft to a depth of eighty feet on the slope of a hill has been sunk on two veins, and it is reported that the latter, which consist of very fine graphite of the lamellar and columnar variety, exhibit a great regularity, both as to dimensions and their relation to the containing formation. At present a tunnel is being

driven from the foot of the hill towards the shaft; its total length is now 280 feet, while 50 feet more will be driven to reach under the present shaft. An upraise of 50 feet will ultimately connect the latter with the tunnel.

The big mill building measures 60 x 90 feet square, and is calculated to treat about 50 tons of graphite rock per day. A new departure in this mill will be made by the introduction of pebble tube mills, for the cleaning and polishing of the graphite flakes. The motive power in the beginning will be steam, but later electricity will be used, which will be generated from a water-power located four miles distant, on the Rouge River.

New discoveries of graphite have recently been made in the township of Amherst, in the north of Grenville, and it is reported that the deposits, which consist of the crystalline variety, are of large extent. Thus, on range VI., lots 15, 16, 17, about 12 miles from Jovite Station, a pit of 12 feet depth was worked in a vein 25 feet wide, the graphite raised being of an excellent quality. It is intended to build a mill on the property as soon as the snow goes off.

The Coals and Coal Fields of Alberta, Saskatchewan and Manitoba

By D. B. Dowling.

(Permission of the Director of the Geological Survey.)

(Toronto Meeting, 1907.)

Any description of the coal fields of the three Prairie Provinces, to be complete, would necessarily be lengthy, but the present paper is an attempt at a resume of the extent and character of the coals to be found there.

The rocks in which these coals are found all belong to the sediments of the cretaceous sea, and the coal horizons are in three successive portions of the period. Each one marks a time when the surface was not very much above the sea, but high enough to support a luxuriant flora. The history of the period seems to be as follows:—At the beginning of the cretaceous time, the land surface consisted of limestone beds which extended westward to the Selkirks. This began to sink along its western margin, concurrently with an elevation in the Selkirk region. This sinking went on to below sea level, but the subsidence was made up by a heavy deposit of sand and mud derived mostly from the elevated land to the west. This then gradually spread eastward, but was very intermittent, so that large land areas were formed and covered by vegetation. A great submergence beneath a muddy sea next occupied a long portion of the cretaceous time, but again the crust was sufficiently elevated to bring the muddy bottom to sea level. The western portion did come to the sea level, or above it, and coal deposits were formed; but it is not definitely known how far east they extended. One total submergence succeeded another, but for shorter time, before this new muddy surface rose above the sea for the last time; and again in its transition period coal beds were formed.

This threefold coal-forming period gives us three horizons in which to look for coal:—At the base, above the middle, and at the top of the cretaceous sea deposits.

The first we call the Kootanie, the second the Belly River, and the third the Edmonton, or Laramie.

In the three formations the quality of the coal varies under two fairly good rules. The first is that in the same district coals of the lower horizons, owing to age and pressure of the beds above them, should show a greater percentage of fixed carbon and also be more compact. The second is a general tendency to increase both the fuel ratio and the compactness in going toward the mountains, mainly on account of the increase in the thickness of all the deposits in that direction, and thus in the load over the seams. The fuel ratio is the fixed carbon, divided by the volatile combustible matter, and the term porosity is here taken to mean the percentage of water absorbed by the coal.

Kootanie Measures.

The lowest horizon is exposed in the raised and tilted blocks of the crust shown in, and in the neighborhood of, the Rocky Mountains. The quality of the coal, as given by the fuel ratio, varies considerably; and from a number of analyses the following notes will show the general range:—

In the Elk River region the variation shown at Morrissey ranges from 3.2 to 6.12. At Fernie the ratio increases from 3.22 to 4.60 in the lower seams. At Michel two seams differ slightly, the ratios being 3.5 and 3.7. The eastern outcrop of some of these seams on Marten Creek evidently show less change in the physical structure as the ratio falls from 2.08 to 1.86. In order to bring all the areas under notice, lists are added, giving full rate and thickness of seams, arranged in order of hardness. The areas within the mountains may briefly be outlined as:—

(1) The Elk River basin, with 22 workable seams containing 216 feet of coal. This, with a slight gap, extends north to the head of Elk River.

(2) Crows Nest areas, several narrow blocks known as the Coleman-Blairmore areas, with 21 seams and 125 feet of coal, and extending north, ending with the Sheep Creek area in front of Mount Rae.

(3) Moose Mountain area, south of Morley, with 2 seams, 7 and 8 feet respectively.

(4) The Cascade area, running from the mountains north of the Elbow River northward to near the Saskatchewan, having mines at Canmore and Bankhead. In the vicinity of the Bow River there are 10 to 14 workable seams, and 75 to over 100 feet of coal. Its extension north of Red Deer River has 15 workable seams, with 114 feet of coal.

(5) Palliser area, on Panther Creek, east of Cascade coal basin, several seams known. Area not extensive.

(6) Costigan area, on Panther Creek; five seams known, with 27 feet of coal.

(7) Bighorn area, running from Saskatchewan River north to past Brazeau River; only about 5 seams yet located, largest 16 feet.

Other areas in foothills, or farther north, not yet discovered.

The Kootanie coals are all so well compacted that less than 2 per cent. of water, as a rule, is absorbed by any. Their porosity is not considered in the list which here follows, but they are given in order of hardness.

List of Kootanie Coals by Fuel Ratio.

Locality.	Fuel ratio.	Thickness of seams examined	
		feet	inches
Anthracite, Alta., seam A.....	11.59	7	0
Marsh mine, lowest seam.....	8.79	4	0
Bankhead mine, seam No. 2.....	7.98	8	0
Cascade River, old workings	7.50	4	0
Palliser area, Panther River	7.89	5	0
Palliser area, Pantheir River	7.30	2	0
Marsh mine, from old tunnel	7.23	12	0
Canmore, seam No.	7.10	5	0
Costigan area, 2nd from top	6.97	4	0
Marsh mine, seam above tunnel	6.92	4	0
Sheep Creek, 1st seam opened	6.92	8	0
Canmore, Alta., seam No. 1.....	6.61	5	0
Sheep Creek, higher seam	6.49	8	8
Marsh mine, upper seam	6.54	10	0
Morrissey, lower seam	6.12	18	0
Canmore, seam No. 4.....	6.00 to 5.35	3	0
Marsh mine, highest seam	5.95	15	0
Costigan, seam eastern outcrop	5.84	4	9

Locality	Fuel Ratio	Thickness of seams examined feet	inches
Costigan area, lowest seam, west outcrop	5.79	11	0
Sheep Creek	5.76	10	4
Coxcomb, Mt. Jumping, Pound Creek.	5.75	3	0
Canmore, Alta., seam No. 2	5.37	4	0
Canmore, Alta., seam No. 5	5.34	5	0
Thorne mine, Moose Mountain	5.15	7	6
Canmore, seam No. 6	5.06	4	6
Costigan seam, western outcrop	4.89	4	9
Costigan area, 3rd seam from top	4.85	3	9
Costigan area, 4th seam from top	4.83	3	6
Fernie, B.C., lowest seam	4.60	22	0
Moose Mountain, outcrop of seam	4.05	5	0
Sheep Creek, Moose Mountain seams.	3.65	3	0
Snow Creek, Panther River, Cascade area	5.36	5	0
Michel, B.C., lowest seam	3.70	10	0
Michel, B.C., highest seam	3.50	15	0
Fernie, Mine No. 3	3.49	6	0
Fernie, Mine No. 1	3.41	9	0
Fernie, Mine No. 1	3.22	8	0
Morrissey, B.C., highest seam	3.20	18	0
Elbow River, branch west of Moose Mountain	3.12	5	4
Oldman River, 1 1-2 miles east of gap	2.92	5	0
Saskatchewan River, opposite Bighorn Range	2.79	5	0
Elk River, head of	2.71	13	0
Oldman River, N.W. branch, North Fork	2.70	8	0
Oldman River, South Fork	2.47	9	9
Branch of Brazeau, Bighorn Range	2.37	16	0
Marten Creek, Jubilee seam	2.08	30	0
Oldman River, near gap	1.90	5	7
Marten Creek, B.C., Peter seam	1.86	14	0
Marten Creek, B.C., small seam	1.61	2	0

BELLY RIVER MEASURES.

The middle horizon is exposed in the foothills, where it is brought up by a general rise toward the mountains. This is known only in small portions, and provides a good grade of very compact lignitic coal.

Under the surface of the plains it is disclosed along the deep excavation, or trough, through which the branches of the South Saskatchewan flow. A slight roll in the measures, running in the general direction of the Coteau, exposes these measures north of the surface depression of the South Saskatchwan, and beds are recognized to near the Vermilion lakes, a short distance south of the North Saskatchewan. In this northern extension little coal has yet been found, and eastward the measures are covered by higher beds, due to a slight depression of the beds in that direction. The interesting feature of the eastern extension of the formation, is its possibility of carrying coal into the central portion of Saskatchewan. Such occurrences of loose lignite near Prince Albert, and a seam reported on the face of the hills between Montreal Lake and Lake la Ronde, as well as in the bed of the Saskatchewan, above Saskatoon, appear to be encouraging. The fact that boreholes near Carlton and the Elbow of the Saskatchewan have not revealed seams, may mean only that the drilling began below the coal bed. The seams of the Lethbridge area are not numerous, the coal mined there being only about 5 1-2 feet. At other places near by the thickness does not appear so great. Near Medicine Hat a five foot seam was worked, but the coal appears to be very porous and carries a high percentage of water.

The horizon containing most of the coal is in the upper part of the formation, and thus separated by about 1,000 feet of shales from the lowest coals of the highest horizon. So that the border of the recognized areas of Belly River rocks are marked by coal seams.

Comparisons of the fuel ratios in the Kootanie coals give us what might be called a scale of their hardness. The same comparison in the fuels of the upper horizons show only the degree of alteration that has taken place in them during their change from vegetable matter toward the more stable condition as coals. They all show, in a marked manner, that their substance has not been so compactly pressed, as they all absorb much greater percentages of water. The Belly River coals are slightly denser than the Edmonton coals of the same district, but it is not until the seams outcrop near the mountains that this character is well marked.

In the western upturn they carry less than 3 per cent. of water, while the Edmonton coals run from 3 to 7 per cent. For the Lethbridge area the difference is not so strongly marked, except at one or two localities.

COALS OF BELLY RIVER FORMATION IN WESTERN UPTURN OR FOOTHILLS.

Localities.	Fuel ratio.	Porosity per cent.	Thickness of seam ft.	in.
Head of Mill and Pincher Creeks	2.96	1.99	8	9
Mill Creek, 4 miles above mill	2.02	1.63	8	0
Sheep Creek, Tp. 19, R. 4, west of S	1.62	2.16	5	0
Sheep Creek, Tp. 19, R. 4, west of S	1.57	2.50	7	0
Morley, on Indian Reserve	1.18	1.26	6	0

COALS OF BELLY RIVER FORMATION IN LETHBRIDGE AREA.

Localities.	Fuel ratio.	Porosity per cent.	Thickness of seam ft.	in.
Taber Coal Co	1.83	10.8	3	3
McPhee Mine, near Taber	1.72	11.35	2	7
10 1-4 miles above Medicine Hat	1.62	17.70	4	0
Belly River, Driftwood Bend	1.40	9.18	3	3
St. Mary River, 7 miles from mouth	1.38	7.02	3	8
10 miles from Medicine Hat	1.38	16.82	4	0
Bow River, Grassy Island	1.34	11.96	4	6
Red Deer River, 9 1-2 miles below Bull pd	130	13.06	3	6
Milk River Ridge, north side	1.32	5.58	3	0

Stair, main seam	1.25	20.54	5	0
Red Deer River, 4 1-2 miles below Bull pd	1.15	13.63	1	6
Red Deer River, 2 miles below Bull pd	1.19	12.62	1	3

LARAMIE—EDMONTON COAL AREAS.

The larger coal areas of both Alberta and Saskatchewan are of the formations and are practically on one and some same horizon which occupies the dividing line between sea deposits below and fresh water and land deposits above. Some of the coal seams are in the upper fresh water stage—the top of the Laramie; but the majority are in beds separated by sands and clays, holding remains of organisms which lived in brackish water—the Edmonton, or lower Laramie. In Saskatchewan the divisional lines between these deposits are not worked out; but in Alberta, the beginning of fresh water stage is drawn at about the horizon of the Big Coal Seam on the Saskatchewan. The formation originally probably covered a very large area, but the uplift of the western edge, and the subsequent denudation of a great part of the plateau formed of these soft beds, has left remnants only of the upper coal rocks. In Saskatchewan these remnants occupy the high lands in the Cypress Hills and Wood Mountain and a triangular area eastward from the Coteau.

A great excavated depression running outward from the mountains, branching to north and south of Cypress Hills, separates them from the plateau running north and south and sloping eastward from the foot of the mountains. The western coal area occupies a belt near the eastern edge of this slope, narrow at the south, but widening northward, reaching its maximum in the latitude of Edmonton. The coal rocks are then covered farther up the slope by heavy beds of sandstone, but emerge from under them along a narrower band just in front of the foothills in some parts, and in others, generally in the south, nearer the mountains. There is thus one part of the field which has suffered much pressure, and in this the coals show the effect of the compression. The thickness of the seams in this area appear to increase to the north. Thus, in the vicinity of Bow River, seams of 4 1-2, 6 and 9 feet are the best that are known; but in the vicinity of the Saskatchewan, seams of 8, 18, 4 and 6 feet occur near Edmon-

ton and at the Pembina River; the horizon of the Big Seam shows 3 seams, 13, 13 and 6 feet, or 32 feet of coal.

In the Saskatchewan areas, the coal seams of the Cypress Hills and eastward to Wood Mountain, are all thin; but a 4 foot seam south of Cypress Hills may prove fairly persistent. In Wood Mountain two seams of 6 and 8 feet respectively will probably be utilized. On the eastern side of the Coteau at the Dirt Hills, three seams, 7, 3 and 6 feet, are reported. In the Souris district seams of 5 and 8 feet are being mined, the latter reported as thickening to 15 feet toward the east.

In the following list, which is here, for uniformity, arranged as the others in order of fuel ratio, the porosity runs somewhat at variance with this scheme; but if the arrangement had been by porosity only, a regular progression from west to east would have been more nearly secured, since all the coals absorbing water from 3 to 7.1 per cent. actually come from the beds in the disturbed western part of the field. All those absorbing from 8 to 14 per cent. are from the eastern portion of the Edmonton field, while all with a porosity of from 14 to 22 per cent. are from the Saskatchewan areas.

List of Laramie and Edmonton Coals in Order of Their Fuel Ratios.

Localities.	Fuel ratio.	Porosity per cent.	Thickness of seam ft.	in.
Shaw's Coal Mine, Fish Creek..	1.66	3.76	2	0
Blackfoot Reserve, 6 1-2 miles below Crossing	1.6 to 1.5	12.31	4	8

THE SUPPLIES AND RESERVES OF IRON ORES

By John Birkinbine, Philadelphia.

(Toronto Meeting Canadian Mining Institute, 1907.)

In technical publications and in trade journals attention has been given lately to the probable exhaustion of some mineral products, and it is proper that this be considered seriously, for in all business enterprises the important question of supply and demand should receive careful study. The fact that the minerals discussed are nature's products does not suggest a different treatment from others obtained artificially.

The weather conditions which affect agriculture are features in determining the probable supply of and demand for grain, etc., each season or year, but the supplies of the minerals of which this paper treats are considered by decades or by cycles of years, for they are not reproductive. The reserves for the future exist to-day, and the problem to be determined is for what length of time these mineral reserves may be expected to supply the demand.

Progress in all metallurgical lines has been rapid, outputs of minerals and production of metals doubling and trebling in a few years, and these augmented quanties have directed attention to the problem of securing a practically permanent supply of raw materials. The question as to the time when the coal beds of the world, of different countries, and of portions of countries, will be exhausted has often been presented, and the rate at which forest areas have been denuded has directed attention to the supply of timber and vegetable fuel being curtailed.

Enormous increases in the use of copper, due primarily to the phenomenal development and utilization of electrical energy, have caused some writers to anticipate that in the near future there may be a shortage of this metal, and the probability of a scarcity of the precious metals has also been prophesied. Tremendous strides in the manufacture of iron and steel, the great combinations formed for the manufacture of these metals, and the purchases or leases of large mineralized areas have brought prominently into notice the possible exhaustion of the iron ore supply.

Some of the discussions have apparently been based solely on an assumption that if a certain rate of increment has been maintained for a specific time, that this rate will be continued, and then the calculation is simple, viz., to the known amount of material now mined, add percentages representing the increased demand for a term of years, and use this as a factor to learn how long the apparent supply will continue. But in any discussions of these problems many features must be taken into consideration.

In all mineral deposits we must face their ultimate exhaustion, because they are not reproductive, at least not to an extent which would make such reproduction appreciable in the supply and demand. In the forests different conditions prevail, but

even there the rate of accretion is limited, for trees only mature after a number of decades. This, however, permits of judicious protection and propagation, and the growing appreciation of forestry gives promise, if the interest is maintained, of a supply of timber which, though restricted, may be depended upon.

Among the features which demand attention in determining the probable exhaustion of supplies of minerals are the methods employed to win them, many of which are and have been wasteful. Mining in years past, and, in some localities, at the present time, removes the better mineral only, leaving the less desirable in the ground or consigning it to the waste heap, often mixed with refuse material.

A second factor to be considered is the composition of the mineral, for only occasionally are metals found in the metallic state. Nuggets of gold are not uncommon, placers yield gold in metallic particles; lumps and even masses of native silver or copper occur, and galena is fairly abundant, but, although aggregating large quantities, these represent but a small portion of the total metal marketed. Iron in a metallic state only occurs as meteorites, but the aggregate known weight of these hardly amounts to one hundred tons.

As a rule a number of metals or elements are combined in the mineral won from the earth, and the influences of some of these components are deleterious, especially for particular uses; consequently an ore, rich in a given mineral, may be much lessened in value for present use by reason of the association in which the metal is found. But in determining the possibilities of exhausting the supply of any natural product, it is unfair to assume present practice and knowledge as limiting the use of the metal under consideration. Methods of treatment, or of beneficiating may bring into demand metallic ores which now are considered undesirable.

Taking the supply of iron ore as the subject for this paper, it must be admitted that in many localities ore has been rejected in the mines, or casts on roads or dump piles, superior to other ores which are successfully used elsewhere. This leads to the natural assumption that the deposit was wrought before its product was required, or that it was not judiciously operated, or that to reach points of consumption the mineral had to stand excessive transportation and handling charges.

In the early history of the iron industry of America the initial enterprises were developed by plants using ores, few of which to-day would be accepted as desirable. The prices received for pig metal were far in excess of what is now commanded, and the cost of production was relatively high, but the progress made in technology, and the improvement in equipment and practice which are responsible for the enormous development of iron manufacture may go far towards overcoming the objection to these now discarded minerals.

Beyond the use of ore, fuel and flux fed to vertical furnaces in which air blast accelerates combustion, there is slight similarity between the production of iron now and seventy years ago. May we not expect as radical changes in the future?

During the first visit of the Iron and Steel Institute and the Verein Deutscher Eisenheutenleute to the United States in 1890, the delegates were divided into two parties, one going north into the Lake Superior Region, and one south to Alabama. It was the writer's privilege to explain to those taking the northern trip that they were walking on a road largely composed of discarded ore, higher in iron, and lower in phosphorus, than their colleagues were contemporaneously examining in Alabama. To-day such ore is not cast into roads, but is shipped, and this shipment is profitable because of the perfected mining, handling and transportation facilities which prevail in the Lake Superior Region, and because of modern metallurgical processes.

A third factor is quantity, for the demands of a single industrial plant for a day are now as great as that of an original plant in a year's time, and the apparent extent of a deposit receives consideration not required in former years. Numerous iron ore mines which have been wrought are now abandoned and lie dormant, not all of them because of leanness of ore or of their composition, but because a number of mines would have to be combined and operated to make a material increment in the supply for a modern iron and steel industry. Most of these deposits had been used locally, but it is not improbable that a combination of several under efficient management would permit of operating them successfully, and delivering the materials to consumers by modern transportation methods at satisfactory cost.

A fourth factor is the utilization of metallic alloys and the possible substitution of other metals for specific purposes. In constructions the modern tendency is to study strains and forces, and prepare designs to secure the best distribution of material. Steel and concrete largely displace wood and brick buildings, but each member of a structure, vessel, machine or tool, is carefully calculated to reduce the weight or quantity to a minimum. If we employ wasteful metohds in mining, in smelting, and manufacture, and apply masses of metal rather than well proportioned parts, if we fail to make use of improved forms and combinations, we may expect to pay the penalty.

As to the future supply of iron ores, a number of papers written by gentlemen who are considered either as local or national authorities, indicate a tenor of anxiety, or phophesy the exhaustion of the iron ore resources of the world. It may be presumptuous to take exception to the opinions of these authorities, but the writer fails to find justification for many of the conclusions stated.

A geological survey is considered an essential feature for any progressive government, whether national, provincial or state, and a large number of academies and colleges educating the youth, teach the elements of geology, while the search for mineral wealth has encouraged the pioneer and the prospector to penetrate into the mountain fastnesses and wildernesses of all countries. But who of these is willing to assume that the world has anything like a complete knowledge of the earth's crust and its mineral wealth?

"The unexplored regions of the earth" is the caption of a recent magazine article by Mr. Cyprus C. Adams, which is illustrated with a series of continental maps, indicating by shaded areas the *terra incognita*. This shows graphically how much of the earth's surface is unexplored, and the author states: "Unknown regions have wholly disappeared only from the map of Europe. Its entire surface has been scientifically explored, though much detailed research remains to be made. Its map is approximately correct, and we have a very large, if not complete, knowledge of its material resources. . . Many years will elapse before any other continent is as well mapped as Europe. . . and a large amount of pioneer work still invites the explorer, for many of the unknown areas have much territorial extent."

As to the North American Continent, the statement is made that: "Archæologists say that their branch of science requires the exploration from their special point of view, of most of Western North America, from Nevada to the Arctic; but they cannot enter parts of this area without cutting into regions that have never yet seen an explorer. . . Official surveys in Canada have in fifteen years reduced the unexplored areas more than one-half. . . parts of Alaska aggregating an area six times as large as that of New York are still unmapped and practically unexplored."

There is scarcely a mining district which fails to show instances of early exploitation, abandoned because it was believed to be unproductive, but subsequently developed into important producing mines. The story of mines yielding good mineral, but which were conisdered as approaching exhaustion, being galvanized into new life by the discovery of parallel veins or deeper lenses is repeated, even in the older mining centrs. Giving full crdit to the ubiquitous prospector, to the energetic geologist who spends months in the field, and to the mining engineer who explores

ahead of his working, can all these claim to have done more than "scratch the surface?" If not, we must believe there are in the earth many deposits of value now unsuspected, or at least not located by research. Some deposits of iron ores, passed by because they are lean, or by reason of the phosphorus, sulphur, titanium, etc., which they carry, offer inviting fields for experiment by chemists and metallurgists, for these valuable allies of the iron industry have assisted in making some minerals which would otherwise be condemned take place among those which are desirable. It is evidently unfair to eliminate from the list of iron ores those which carry considerable titanium without giving credence to the investigation of, and experiments with, electric smelting made by the Dominion Government, or the exhaustive and conscientious work of Mr. Rossi. It would be equally unfair to cast aside a highly sulphurous iron ore without considering what could be done by roasting, nodulizing, and, in some cases, separating. Nor are we justified in designating a highly phosphoric ore undesirable until the possibility of separating this magnetically, or with jigs, is considered, the utilization of the mineral to produce basic or foundry pig iron tested, and the possibility of value from the phosphate extracted determined. Some silicious ores formerly rejected, but which now are sought for to mix with less silicious minerals, form another illustration.

The largest iron and steel producer in the world, having enormous reserves, has lately added to these by entering into a lease whereby it has the privilege of mining large quantities of ore from the lands of a transportation company, and the liberal rates agreed upon for transportation to upper lake ports and for royalty, has influenced the general belief in the possible exhaustion of iron ores. This contract starting with the year 1907, provides for mining at least 750,000 tons of ore during the year, and paying therefor $1.65 per ton, on which, at existing transportation rates, 85 cents may be considered royalty on ore yielding 59 per cent. of iron when dried at 212 degrees Fahrenheit. The contract also provides that in each year thereafter the quantity mined is to be increased by 750,000 tons or more, and the royalty advanced 4 per cent. For the year 1917 the minimum tonnage will be 8,250,000 tons, and the rate paid $1.90. Thereafter at least an equal amount of ore (8,250,000 tons) is to be taken out annually, but the 4 per cent. increase in the charge for royalty continues, so that in 20 years the rate will be $2.33 per ton, and in 40 years $3.00 per ton will be paid for freight to docks and for royalty. This contract demonstrates that for at least 40 years a demand for metal is expected, and as the agreement continues until the mines are exhausted, a continued advance in value is looked for.

That this lease would have a decided influence upon the iron ore trade generally was to be expected. A resume of its terms shows that for the

	Total which must be mined.	Royalty and Freight per ton.
1st 10 years	41,250,000 tons.	$1.65 to $1.96
2nd 10 years	82,500,000 tons.	1.99 to 2.30
3rd 10 years	82,500,000 tons.	2.33 to 2.64
4th 10 years	82,500,000 tons.	2.67 to 2.98

But this contract does not necessarily indicate exhaustion of the iron ore supply of the United States, it rather insures a convenient and desirable supply of raw material to plants already in operation, or under construction, where the operating company has large investments. Believing that it has a market at its own furnaces for all the ores which it can produce, the contract insures the industry a continuous supply. The lease also eliminates a possible competitor with extensive mineral properties, large capital, and an assured market for manufactured steel.

The writer lays no claim to personal familiarity with the iron ore deposits in all countries, and is willing to concede to geologists, statisticians and metallurgists of other nations a knowledge as to details which he does not possess, but an association with the United States Geological Survey for two decades brought him in correspondence with all the iron ore mines in the United States, and professional investigations of iron ore deposits in various parts of the United States, Canada and Mexico has aided him in judging the North American reserves. Correspondence extending over a number of years with specialists, and a careful study of published data, have also added information concerning the deposits which are available in other countries.

Examination of the various articles and papers which have appeared concerning the iron ore reserves, show that some are evidently influenced by patriotic feelings, or affected by the intimate knowledge one has of his own country. As an instance, the table presented by Prof. Tornebohm, of Sweden, may be cited. This table credits to various countries the following iron ore reserves:—

Countries.	Workable Ore Fields, million tons.
United States	1,100
Great Britain	1,000
Germany	2,200
Spain	500
Russia and Finland	1,500
France	1,500
Sweden	1,000
Austria, Hungary and other countires	1,200
Total reserves	10,000

This table is not offered to criticize Prof. Tornebohm, nor to emphasize the national bias which may be expected to prevail, nor is it presented with any intention to be unfair to other countries, for the writer's basis of estimation may be open to similar criticisms in so far as the reserves of North America are concerned. An honest endeavor has been made to keep fairly within limits, for the purpose of this paper is a frank discussion of the iron ore resources of the world. If we are facing in the near future, or at any time, exhaustion of an important natural resource, the sooner this is appreciated the better.

Crediting Professor Tornebohm with superior knowledge of European ore deposits, and also of those from Asia and Africa, which have been drawn upon, his presentation of the problem may be discussed from the American standpoint. The estimated reserves allotted to the United States, 1,100,000,000 tons, are less than have been commonly credited to the Lake Superior iron ore region alone. One estimate given currency in the past year puts the total for this district above 1,500,000,000 tons, and the lease above referred to is generally accepted as covering a tonnage equal to 40 per cent. of the reserve allotted by Prof. Tornebohm to the United States.

Professor Tornebohm's figures for the United States are made up of 1,000,000,000 tons for the Lake Superior region, 60,000,000 tons for Alabama brown hematites (this omits any consideration of the red hematite deposits—the principal reliance of the Alabama-Tennessee furances), with 40,000,000 tons left to complete the total of the unmined ores in New York, New Jersey, Pennsylvania, in all the Southern States (except brown hematite mentioned), and the ores of all Western States, including Wyoming, Colorado and New Mexico, where iron ores are now won.

In criticizing these quantities, some vague optimistic statements have appeared which are not answers to the Swedish figures, and do more to befog than to clear the situation of uncertainty.

The writer had, while representing the United States Geological Survey, unusual facilities to be posted as to the iron ore reserves of the United States, but he has hesitated to offer estimates on these, because the more the subject is studied the more favorable the outlook for the future appears, and he merely suggests the following:—

If Professor Tornebohm's estimate of the United States is incorrect we may question his estimates for other portions of the world, at least those outside of Europe. The Swedish professor credits his own country with ores of high metallic contents and with ore reserves equal to those of Great Britain, twice as great as for Spain, nearly as much as for the United States, two-thirds as large as for either Russia and Finland, or for France. This

may be accepted as due to a more intimate knowledge of the enormous deposits of his own country and not to a desire to minimize those of other lands. If his total of 10,000,000,000 tons is accepted as representing the ore reserves of the world, his apportionment of these must also be accepted, which is as follows:—

	Per cent.
Germany	22
France	15
Russia and Finland	15
United States	11
Great Britain	10
Sweden	10
Spain	5
All other countries, including Austria-Hungary	12

On this basis Europe would possess more than three-fourths of the iron ores of the world.

He is certainly not optimistic concerning the United States, nor do his figures apparently recognize the known deposits of iron ore in Newfoundland, Canada, Mexico, Cuba or South America. He makes small allowance for Asia, with known iron ore deposits in China, Japan, India, and in the Pacific islands. Nor does he give sufficient credit to the geological reports of Australasia, nor allow for ore reported as existing in quantity in the great continent of Africa.

Of his total reserves 7,700,000,000 tons are given to Europe, 1,100,000,000 tons to the United States, and but 1,200,000,000 tons to Austria-Hungary and other countries, which include all of Asia, Africa, Australasia, the Pacific islands, Cuba, South America and North America, outside of the United States. The limited exploitation of Canadian iron ores is evidently assumed as a basis for calculating the reserves, instead of the researches made by the Canadian Geological Survey and individual investigators.

Canada is not mentioned, but is included in "all other countries," attached as an appendage to Austria-Hungary. The known deposits of iron ore in the Dominion are believed to exceed those of Austria-Hungary, and but few of these have been exploited. The possibilities of the British possessions in North America are vast, and they may be confidently expected to outrank as iron ore producers some of the countries specifically named.

The prophecies of exhaustion of iron ore depend for their fulfillment on a practical continuance of existing conditions, such as the relative location of iron ore producing mines, iron ore consuming plants, coal deposits and coke ovens, moderate changes in labor conditions, labor saving or transportation facilities ceasing to improve, manufacturing and industrial centres being mainly limited to those now recognized, on little, if any, progress in the metallurgical processes. Moreover, such prophecies omit the possibilities of other metals or alloys being procured at a cost competing with iron at or near present prices.

Had the iron-master of half a century ago been informed that in 50 years the production of iron would reach the quantities now annually made, and had be believed this otherwise possible, he would have prophecied that sufficient ore could not be found to produce such an enormous output, and he would have expressed doubt as to the possibility of obtaining fuel to smelt the ores or of assembling the necessary raw materials at blast furnaces.

If we are to estimate the iron ore reserves for future use, we must also consider their utilization, which we have no right to assume will be kept within the limits of present industrial development or transportation facilities, nor even confined to prevalent methods of metal production. They are also to be estimated in their relation to the coal reserves if the metallurgical processes of the present are to be followed. Such considerations may make available some ore deposits which are now remote from commercial centres or distant from exploited coal fields, for unless we assume that there are to be no further advances in this particular the utilization of various coal deposits and of iron ores convenient to them is to be anticipated.

The practicability of electric smelting of iron ore, which has been the subject of detailed study and report in Canada, may be of importance in the future, especially in the treatment of ores whose composition or physical condition are in the present status of knowledge, undesirable for us in the blast furnace, and experiments with iron sands by the United States Geological Survey offer a possible reserve of iron ore of considerable importance. The same resource, ability and skill which have brought the iron and steel industry to its present status may be counted upon to overcome many objections to ores which are impure or distant, and, with new metallurgical methods, ores now avoided because of elements in their composition, may be in demand.

It is well known that some iron ore deposits are removed from present or immediately prospective transportation facilities, are distant from fuel, are lean, and must be beneficiated. But when we remember how iron ores of the Lake Superior region have been the incentive to gridiron that section with railroads and to build an enormous inland marine, equipped with loading and unloading facilities second to none, distance becomes comparatively unimportant where ores are conveyed by boat for less than a mill per ton mile, and where long railroad hauls can be provided at 3 mills per ton mile. Under such circumstances ore can be carried to fuels or fuels to ores, or the two can meet at desirable points at costs which need not be prohibitive.

The liberal use of Swedish, Spanish, African and other foreign ores by European and American furnaces, and the large proportion of the ore supply of the United States and Canada coming from the Lake Superior region, illustrate how transportation facilities affect the locality of supply. So beneficiating, modern mining methods, or economics in mechanical appliances, permit lean ores to be mined, roasted, comminuted or separated at small cost. In the existing stage of mining and mechanical development, and with the study which has been devoted to labor-saving appliances, transportation facilities, methods of beneficiating ores, etc., the leanness of ores and present distances from points of consumption, are not to be given too much importance.

Using the lease before mentioned as a basis, we may assume that transportation costs will decrease rather than increase, and accept the present rate as fairly covering this item. Deducting, therefore, 80 cents from the rates fixed, the royalty or apparent value of the iron ore in place is expected to advance from 85 cents to $1.16 per ton in the first decade, from $1.19 to $1.50 in the second decade, and from $1.87 to $2.18 in the fourth decade. In other words, if the lease continues, and the ore lasts forty years, its value in the ground will be nearly trebled.

Accepting, for the purpose of discussion, this increment of value, there would seem good reason for exploiting a number of iron ore deposits which are now inactive, because of their character or location. The convenience of using ores rich in iron and the facilities for obtaining such material as wanted by purchase, have encouraged the transportation of desirable mineral over long distances to furnaces close to which relatively inferior ores lie unused. The freight added to the selling price of these more desirable ores in some instances brings the cost of producing pig metal above what may be expected by using relatively inferior and cheaper local ores.

It is hardly equitable to compare ore reserves on the basis of what is esteemed as desirable by the present practice in various countries. Thus, in the estimates made by Professor Tornebohm for the Swedish Government, he credits Great Britain with as much ore as he allots to the United States and Germany, with double that quantity of iron ore for future use; but for the United States he assumes a yield of from 45 to 67 per cent., and for Germany from 30 to 45 per cent. In other words, the estimated 1,100,000,000 tons for the United States is all treated as of a grade superior to the richest of the British or German mineral. Dividing the ore reserves by the percentage of iron, Professor Tornebohm allots to the various countries the following:—

	Tons of Metallic Iron.
United States	603,166,600
Great Britain	295,000,000
Germany	825,000,000
Spain	249,375,000
Russian and Finland	637,500,000
Sweden	611,538,460

(This statment was prepared by Mr. Chas. K. Leith.)

Germany is thus given pre-eminence as an iron producer, and Russia and Finland, Sweden and the United States are placed next in order, followed by Great Britain and Spain. The difference in labor and transportation costs in the various countries or districts will permit those where these items are relatively low using lean ore at a profit. But, if necessary, the United States could utilize, and some plants are now smelting, mineral closely approximating the yields of iron mentioned as employed in Great Britain and Germany.

The papers and discussions upon the probable exhaustion of iron ore supplies serve a good purpose by awakening interest in a subject of importance to all who produce, manufacture or use iron or steel. Results to be anticipated from such discussions are: That known deposits of iron ore classed as undesirable by reason of location, apparent volume, physical structure or chemical composition, may receive consideration; that some ore bodies, now unopened, may be exploited, and that mines which have been wrought in the past may re-enter the list of producers, while encouragement to develop new sources of iron ore may come from the discussion.

The fact that a number of ores considered unattractive by blast furnace managers can be made available, has received less attention than would have been given had the better ores been more troublesome to obtain. But roasting pyritiferous and other ores has been followed for many years; more complete desulphurization and nodulizing of comminuted sulphurous ores is now practiced on a commercial scale; a large tonnage of magnetite is passed through magnetic separators, to reduce the silica or phosphorus contents; and practical demonstration has shown that titaniferous iron ore, when properly fluxed, may be economically smelted, while electrical smelting is being thoroughly investigated. The field for beneficiating and treatment of iron ores is large, and promises a considerable addition to the possible iron ore reserves.

The writer fully appreciates the importance of a frank study of natural resources and the folly of wasteful use of them, especially such as are not reproduced. He also is satisfied that his record as an investigator of deposits of iron ore and his reports upon industries remove him from the class of optimists who expect every indication of ore to develop into a great mine, or that each locality where ore and fuel can be assembled advantageously will become an important prospective industrial centre.

The problem is to be studied from the standpoints of deposits now exploited, of those unwrought, but concerning which ideas of their extent and character have been formulated by exploratory work, and of those whose locations are made known by prospecting, with allowances for probable iron ore supplies suggested by geological conditions.

If the study of the iron ore reserves is undertaken in connection with present or possible fuel supplies, with consideration of prospective producing and consuming centres, the time when iron may be a "precious metal" or the available supply of iron ore becomes exhausted may be so far in the future as to allay any present anxiety.

The greatly augmented production of iron is undoubtedly making such heavy draughts upon the developed iron ore mines in the world as to awaken interest in the question of future supply, and unless there are additions to these one need not be pessimistic in anticipating a shortage.

On the other hand, when the probabilities of located but not developed ores are considered, when the possibilities of advanced metallurgy are studied, and when we realize how much of the earth's surface and geology is still unknown, or imperfectly known, one need not be an optimist to express confidence that an ample supply of ore will be found to meet the needs of mankind.

But he who formulates estimates of quantities from which to prophesy the end of the world, as far as iron ore is concerned, or he who multiplies these quantities by vague percentages, demonstrates how little reliable data is available concerning the iron ore reserves.

Recent Developments in Mining in the Southern Yukon

By D. D. Cairnes, B.Sc., M.E., Geological Survey, Ottawa.

(Toronto Meeting Canadian Mining Institute, 1907.)

By permission of the Director of the Geological Survey.

In introducing this subject, it may not be entirely amiss to mention some of the conditions under which mining operations must be conducted in this somewhat northerly portion of Canada. Until very recently the common idea of this district was that it was one of perpetual snow and ice, and one very difficult of access. Pictures and newspaper accounts of the Chilcoot Pass and the building of the W. P. & Y. Railway are mostly accountable for this opinion. Now a person can travel to Whitehorse or Dawson with the same comfort as to any of the ordinary popular summer resorts of the West.

Steamers ply regularly between Seattle and Vancouver and Skagway—distances respectively of about 1,000 and 867 miles. From here Whitehorse is reached by the W. P. & Y. Railway, a distance of 111 miles, thence steamers run to Dawson—460 miles.

The placers for which the Yukon is so well known occur chiefly in the northern portion of the territory—the richest being within a few miles of Dawson, on the creeks running into the Klondyke and Indian rivers. The only places where quartz mining has been done are just west of Whitehorse and along Windy Arm to the south, and it is with quartz and coal mining that this paper has to deal.

In actual mining there are few more difficulties to contend with than in British Columbia, or many other northerly parts of the world where mining is carried on extensively. At least six months are suitable for surface working and for the necessary outside operations, and during several months of this time work can be carried on by night as well, almost, as by day without artificial light; and, although the frost extends to considerable depths, in places, this does not interfere to any great extent, except on the very surface, while working in soil and loose material. The current wage paid to miners in the Windy Arm mines this last season was $3.50 per shift of eight hours, with board and lodging included.

With the exception of the Whitehorse copper district, little or no quartz mining, except a few assessments in scattered places by prospectors, had been done in the Yukon until the latter part of the season of 1905, when Col. J. H. Conrad commenced to develop some properties on the west side of Windy Arm. As a result of this the little town of Conrad has sprung into existence; a great many men have been employed; a

waggon road has been built from Cariboo Crossing along the beach to Conrad, about 11 miles; Government trails have been build up to the mines, connecting several of them; three ærial tramways have been built to carry supplies, etc., to the mines, and to carry ore down to the beach, and a foundation has been laid for what appears to be a permanent industry in the Yukon. Moreover, men have been encouraged to prospect further, with the results mentioned below. A new mining district was also formed this season, with a mining recorder's office at Conrad, called the Conrad Mining District, embracing the Windy Arm district and extending north to include the Watson and Wheaton rivers districts.

It is not the purpose of this paper to go into details in regard to the different properties of this district—a full account of which will be published in the writer's detailed report by the Geological Survey—but merely to give the general characteristics of the district.

Topographically, the country is very rugged, the summits rising as high as 5,200 feet above Windy Arm, or about 7,360 feet above sea level. No timber exists, except in some of the valleys and part way up some of the hillsides, ceasing, however, entirely at about 2,000 feet above the valleys. Most of the Windy Arm properties are situated high up on the bleak mountain sides, and all wood, timber, supplies, machinery, etc., had to be packed or pulled up by mules or horses. This is done now mostly altogether by the ærial tramways. So that prospecting and opening up the properties was both difficult and expensive. The district is, however, very accessible. The ore having arrived at the beach of Windy Arm, is loaded on boats and carried to the railway at Cariboo Crossing. There is also a good grade for a railway from Conrad along the beach to Cariboo Crossing; or a spur could be run from Log Cabin direct to Conrad.

The minerals in this locality are in quartz veins, in true fissures, and the values are chiefly gold and silver. The Big Thing veins are in granite; all the others are in a formation I have called the Windy Arm formation. This consists of a somewhat complex series of porphyrites, diorites, gabbros, etc., which apparently represent rocks from the same magma, but which differ considerably on account of segregation and cooling under different conditions. These rocks are generally fresh looking, fine-grained, and greenish in color. Towards the edge of the series, in places, is a porphyry presenting somewhat the appearance of a conglomerate, due to portions of one porphyry being included in another.

The veins vary considerably in width, but in most cases are noticeably persistent in length. Argentiferous galena is the common mineral of value. There are also found some native silver, argentite, stephanite, pyrargyrite, tetrahedrite, chalcopyrite, jamesonite, stibnite, lead carbonate, malachite, azurite, pyrite, arsenopyrite, pyrrhotite, and sphalerite.

The principal vein on the Big Thing group was struck this summer at the end of an 80 foot drift. A crosscut was then run 60 feet on the vein and a winze was sunk, which, when seen in October, was about 55 feet deep. The vein was widening rapidly and becoming almost flat, and was, in the bottom of the winze, about 10 feet wide. This vein appears to be of the elongated lense type. The ore is chiefly secondary quartz, and is very porous, near the surface, due to leaching action. The minerals are chiefly oxides and carbonates, which will give place to the sulphides in a short distance. Some stibnite, arsenopyrite and pyrite were found near the bottom. High assays, running into the hundreds have been obtained in gold and silver, and it is claimed the ore body will average close to thirty dollars per ton.

On the Montana, a drift was run in on the vein about 700 feet, the vein being from 2 to 5 feet in width, with a streak of rich ore 8 inches to 18 inches wide next the hanging wall, which assays about $90.00. The rest of the vein may run $20.00. An incline had also been sunk on the vein, which, at a depth of 320 feet, was about 8 feet in width, from wall to wall, with over 4 feet near the centre of almost barren, leached, and somewhat decomposed porphyry with quartz stringers running through it. The values are chiefly in silver, the chief mineral being galena.

When seen in October, the Vault, which had a drift run in on the vein over 300 feet, was probably the most promising looking property in the district. This is the same vein, in all probability, as the Venus No. 1, and can be traced over 4,000 feet. It is, in places, 20 to 30 feet in width, being nearly all well mineralized quartz. In places there are 4 to 6 feet of almost solid galena. The lead here, as on the Venus, varies greatly in width, and at times is only a foot or so wide. So far, however, the vein on the Vault has been much more uniform in width than on the Venus.

On the Venus, a crosscut tunnel was run about 100 feet to the vein, and drifts were run about the same distance each way, from which a number of stopes were raised, the vein being from 18 inches to 16 feet in width. In the stopes there are from 4 to 8 feet of good ore, which will probably average over $20.00 in gold and silver. A lower crosscut has also been run 544 feet to the vein, and drifts have been run each way; but where opened up here it is narrower and leaner than in the upper tunnel. This feature is likely only of limited extent, as the property looks well both to the north and south of this place on the surface. The chief minerals are galena, lead carbonate, arsenopyrite, chalcopyrite, malachite, pyrite, and also considerable jamesonite and antimony ochre. The ore is chiefly argentiferous galena. Where the vein is wide it consists of alternating bands of quartz and more or less mineralized country rock. A 50 horse-power gasoline engine operates a compressor here to run the machine drills used in tunnels, but piping and the necessary machinery is being installed to utilize some of the water power of Pooley Canon to replace the gasoline.

On the Humper No. 1, only about 70 feet of work had been done, when last seen, mostly in the form of drifts, but the property looked very promising indeed. The vein, which can be traced for 1,700 to 1,800 feet, at least, is from 18 inches to 4 feet in width, and carries considerable argentite, ruby silver, and stephanite, and also some native silver, galena, and pyrite. About 8 inches of the vein will average over 300 ounces in silver, and a narrow streak of argentite, one-half to three-quarters of an inch in width, which is quite persistent, runs 3,000 ounces in silver.

There are also several properties, such as the M. and M. and the Ruby Silver, on which are veins only a few inches in width, often less than a foot, but which contain very high grade ore.

In the above description of claims seen, no attempt has been made to describe all the promising looking properties or to give many details in regard to those mentioned. Only a somewhat general idea of the character of the deposits and their values has been attempted. The properties are all, as yet, in the prospect stage, and only small shipments of ore have been made from time to time; but what has been done shows this belt to be very highly mineralized at least. Reports of numerous discoveries came in at different times during the season from different directions, chiefly from along Taku Arm, and the ores shown looked very good indeed.

The success met with in this district encouraged men to prospect more than in previous seasons in this locality, with the result that a number of valuable discoveries were made. On June 21st, the Gold Reef claim, on which were discovered quartz carrying free gold and telluride minerals, was staked on Gold Hill about 16 or 17 miles southwest from Robinson, and in the next 90 days 700 claims were located on the same belt. This belt or belts of schists, approximately one-half mile wide, outcrops in a northwesterly and southeasterly direction near the eastern edge of the granites, which often become porphyritic. Dykes of greenish porphyry and porphyrite occur in the granites, also near their eastern edge, and it is in this disturbed belt that the quartz veins occur. They are often quite well mineralized, the chief

(To be Continued)

THE WORKS OF THE ROBB ENGINEERING COMPANY, AMHERST, N.S.

In the year 1865, Alexander Robb, the father of the president of the Robb Engineering Company, established a foundry and machine shop in Amherst, N.S. Stoves and general castings were made, and coal mining machinery was repaired. In 1890 the company was reorganized and incorporated under its present name, the sons of the founder being the chief officers. The following descriptive sketch of these modern works will give a fair idea of one of Nova Scotia's most important enterprises:

To the average man or woman there is a pleasure in watching moving machinery. This pleasure has been greatly enhanced for those who have the opportunity of visiting the modern steam or electric power stations, with their masses of bright machinery, producing thousands of horse-power with entire smoothness and little apparent effort, or a large machine shop of modern construction, consisting of a spider-like structure of steel, high roof and walls more than half glass, an industrial crystal palace, filled with curious machines for planing, drilling, turning and shaping steel and iron. The observer is first attracted by the overhead electric cranes operated by what appears to be a human fly perched in his little cage attached to the huge crane which is running back and forth at the beck and call of the workmen on the main floor of the shop, carrying parts of machinery weighing tons suspended in mid-air.

The cleanliness, light and order of the work form a great contrast to the old-fashioned machine shop, with its small windows, dirty floors and grimy workmen.

The works of the Robb Engineering Company, at Amherst, N.S., especially the new machine shop and electric power house, form one of the best examples of a modern industrial establishment, and arouse the interest of the visitor to an unusual degree. Visitors are always welcome, and to actually see the shops and operation thereof is much better than any description, but we will do our best to give some idea of their extent and system of operation, which will doubtless be interesting to many of our readers.

General Plan.

The works are situated on both sides of La Plance and Lawrence streets, the land having an extent of about 10 acres. Facilities for receiving and shipping material are provided by a system of standard gauge tracks leading through the yards into the machine shops, boiler shops and warehouses, and connected to the extensive station yard of the Intercolonial Railway at Amherst. Narrow gauge industrial railways, for the distribution of raw material and supplies, connect the various shops and warehouses with each other.

Power House.

The steam and electric power house of the company, which is situated between the engine department and foundry, practically in the centre of the works, is a model of perfection. It contains a 350 horse-power Robb-Armstrong Corliss engine, directly connected to a General Electric dynamo of corresponding size. From a large marble switchboard in this power house electric current is taken to all departments of the works which are driven by electric motors of the Bullock, Westinghouse and General Electric make. The switchboard is so arranged that either power or light may be supplied to any portion of the works, and is under control of the engineer. The power house also contains a smaller steam engine and dynamo, of the same description as the larger one, for use at night or for running a portion of the works only. Two Robb-Mumford boilers of 150 horse-power each are used to furnish steam.

The economy of this plant is very marked, as compared with the original steam plant having long steam pipes and engines located in various parts of the work, and leaves nothing to be desired in smooth running and freedom from repairs, as there have been practically no repairs or stoppages since the plant was started, about two years ago.

Adjoining the engine room is a large heating plant, which supplies warm air in winter by underground ducts to various parts of the works, the heat being obtained from the exhaust or waste steam.

New Engine Shop.

The latest and best of the buildings is the new machine shop, built in 1904, for manufacturing the Robb-Armstrong engines. It is a brick structure, of the latest slow-burning construction, 250 feet in length, 100 feet in width and about 50 feet in height. One side of the building, 50 feet by 250 feet, and the full height to the roof, is used for assembling, erecting and testing engines, and is served by a 25 ton electric crane, travelling the whole length of the shop. The other half of the building has an upper floor or gallery, the lower half or main floor being occupied by the heavy machines and the upper floor by the light machines and hand fitting benches. The machinery in this building is of the latest design and is especially adapted to the building of the Robb-Armstrong engines. Many of the machines have been especially built for this work and are capable of machining the parts of these engines from about 15 horse-power up to compound engines of over 2,000 horse-power. The system of work, which has been carried out from the beginning, when these engines were intro-

ENGINE DEPARTMENT, LOWER FLOOR—ROBB ENGINEERING COMPANY, AMHERST, N.S.

duced, is very perfect. Record drawings, duplicates of which are kept in the vault of the company, as well as in the drafting office when finished is numbered to correspond with the drawing and patterns, so that customers can readily obtain duplicate pieces by sending in the number of the engine or part required. The machine and work shops, show every piece of each engine in detail from which the patterns are numbered, and every part of each engine work is all on the interchangeable plan, the parts being made to standard gauges, all turned work being carefully ground and flat surfaces scraped to standard sizes and perfect surface. A large quantity of spare parts are constantly kept in stock for use in assembling engines as the orders come in and to supply the orders of customers for duplicate parts. The workmen having nearly all entered the works as apprentices, have been trained in this special system, so that the organization may be compared to a perfect machine, all its parts working in harmony. A premium system is in use in this portion of the works, and is giving good results. The details of work to be done on each portion of every engine is carefully described and specified to correspond with the drawing, and a set time is apportioned to do each part of the work. If the workman is able to do the work in less time than is specified he is entitled to receive a premium amounting to one-half his regular rate of wages for the amount of time saved. Every piece as it is finished is carefully measured and inspected before being stamped and placed in stock.

BOILER SHOP.

The boiler shop is the next largest department to the engine shop, and is about 100 feet wide x 200 feet long, with several wings. It is also of modern construction, fitted with electric cranes, a complete plant for hydraulic riveting, capable of driving rivets up to 100 tons pressure on each rivet. An air compressor plant, with compressed air pipes to all parts of the boiler shop and other departments of the works is used for pneumatic caulking, drilling, tapping, bending tubes, and almost all the operations of boiler-making and machine work which were formerly done by hand. The shops are also fully equipped with machines for drilling and reaming the rivet holes of boilers, the best modern boiler specifications requiring double butt straps and rivet holes drilled in place, so that there is no danger of imperfect holes and no necessity for drifting and distorting rivet holes, as is found necessary when they are punched without reaming.

This company does a large amount of boiler work under Government inspection, as well as under the local inspectors of British Columbia, Quebec and other Provinces where rigid inspection laws are carried out.

GENERAL MACHINE SHOP.

In addition to the large machine shope, which is used exclusively for engine work, the company have a general machine shop, which its about 55 feet x 200 feet. In this shop special machine work, such as piping, shafting and general machine repairs is done; and also a line of portable sawmill machinery, which is used extensively in the Maritime Provinces and British Columbia is manufactured. The details of the work are carried out on the same general system as in the other departments of the works.

ENGINE DEPARTMENT, UPPER FLOOR—ROBB ENGINEERING COMPANY, AMHERST, N.S.

FOUNDRY.

The foundry, which is in the centre of the works, and connected to the engine building shop and boiler shop by the industrial railway, is equipped and operated on the latest system, having electric cranes, pneumatic lifts and other appliances for handling heavy materials and melted iron quickly and cheaply. The company makes all its own iron and brass castings, in fact everything is manufactured on the premises from the raw material except special fittings, as oil cups and light trimmings required for engines and boilers.

FORGE.

The company has its own forge, which produces machine forgings of all descriptions necessary to engine work, boiler work and the other lines manufactured by the company.

PATTERN SHOP.

The pattern shop is another department well worth a visit, as it is under the direct control of the drafting department, every pattern being made to follow the system of drawings used throughout the works and with numbers corresponding to such drawings. As the patterns are used over and over, they require the greatest strength, lightness and accuracy of dimension that it is possible to get. Some of them are marvels in these respects, when it is considered that they are all made of soft pine, except such small and special patterns as are afterwards reproduced in iron or brass.

STORES SYSTEM.

The stores system of the company has been developed on modern lines, and is arranged so that all the material, parts of the engines and other machines are stored in the warehouse of the company, under control of a general store-keeper, who has a force of helpers to deliver materials or supplies, as called for by requisitions, to all parts of the works. A complete inventory of all the raw materials and work in progress is kept by a card index system, giving a perpetual inventory of these materials, as well as their cost. The system also includes a cost-keeping department, which enables the company to obtain readily the cost of all materials, either in a raw or finished state, and of complete contracts.

The products of the Robb Engineering Company have a world-wide reputation, the company having the distinction of supplying Canadian engines for Great Britain, Spain, Australia, West Indies, British Guiana, Austria, and India, as well as in all parts of the Dominion, from the Atlantic to the Pacific. We noticed among the list of orders shown us under construction engines and boilers for mines, factories, electric light installations and lumber mills in every Province of the Dominion, including the following prominent cities and towns: Sydney, Cape Breton; Halifax, N.S.; St. John, N.B.; Montreal, Quebec; Ottawa, Toronto and Hamilton, Ont.; Winnipeg, Manitoba; Saskatoon, Sask.; Calgary, Blairmore and Bankhead, Alta.; Golden, Kitchener and Vancouver, B.C.

CORRESPONDENCE

[THE CANADIAN MINING JOURNAL, while it welcomes letters on current topics, is not responsible for opinions expressed by correspondents.]

To the Editor of THE CANADIAN MINING JOURNAL:

There are some further arguments in support of the magmatic origin of the hot waters discharged by hot springs, geysers and volcanoes, which I will add here.

The silica, lime and other mineral salts carried in solution in those hot waters would be deposited along the path of ascent and completely fill all pores in the rock by cementation, thereby preventing the access of any surface waters. The deposit of geyserite at the surface in the shape of a small crater surrounding the discharge from such springs, is evidence that there is a surplus of such material carried in solution. These solutions would penetrate the walls of the crater or fissure along which they rise, and when encountering rocks cold enough to cause precipitation would part with a portion of their salts, thereby completely isolating their path from all connection with meteoric waters.

The process of cementation would begin at the point of rock flowage at a depth of thirty-five to forty thousand feet and rise gradually to the surface; the crater of geyserite at the surface being the final evidence that the path is isolated from surface waters.

The cementation of such a channel, fracture or crater, would act in the same manner as the casing of an oil well. It would completely shut out the surface waters, and only differ from the casing in being composed of crystallized rock filling built up from the bottom, instead of an iron pipe driven down from the surface.

At several places in Yellowstone Park it is possible to catch trout from the lake, and, without detaching them from the hook, to dip them in a boiling spring. This fish story will illustrate how completely isolated the path of the hot water or steam is from the cold water inhabited by the fish. Many geologists assume

that the hot waters discharged by such springs and geysers are surface waters, which penetrate into the earth until they come in contact with intrusive hot rocks, and are thereby heated and discharged at the surface. They are willing to admit the absurdity of this argument when applied to the waters discharged by volcanoes, but they hesitate to take the necessary plunge and cut loose from the only source of water supply that they know anything about. The difference between a hot spring and a volcano is only a difference in volume and temperature. One discharges a small amount of hot water with mineral salts in solution, the other throws out millions of tons of atomized or fluid lava, together with a great quantity of incandescent steam or streams of boiling mud.

To illustrate the action of surface waters being heated by coming in contact with hot intrusive rocks, I will refer again to the cementing action of the mineral-laden solutions. If such waters were heated in the manner referred to, the cementation of th adjacent rocks would quickly form an impervious shield about the source of heat and completely shut off all circulation. It is, therefore, only possible to account for a constant discharge of hot water through a long period of time by assuming that the supply is of magmatic origin.

In the paper on "Magmatic Waters" it was pointed out that if the central magma contained only 0.1 per cent. of water by volume, that this would show that there was still more water in the interior of the earth than there is on the surface. An average of 15 known volcanic gases, according to Kemp, shows 1.66 per cent. of water. An average of 14 rhyolites gave 1.16 per cent. water. An average of 13 granites, 0.55 per cent water. It would appear from these analyses that there is several times as much water in the interior magma as there is on the surface of the earth. The opening through which communication is kept up with the interior magma would necessarily be small, and the pressure and temperature of the water gas would finally pass beyond the critical point, where it would be a permanent gas.

According to Chamberlin, Vol. I., page 218, the critical temperature of water is between 610 degrees and 635 degrees Fahr., and, with an initial temperature of 80 degrees and an increase of 1 degree for each 70 feet of depth, this condition of water would be reached at about 39,000 feet. Wherever along the thread-like pipes of hot springs or volcanoes the temperature and pressure pass beyond the critical point of water, the rocks must be in a state of potential fusion, and it only requires that sufficient openings occur for their rapid liberation to cause volcanic action.

The frequent elevation of the sea bottom in the shape of volcanic islands, which later sink from sight, is an illustration of the escape of such hydrous fusions to the surface.

Yours truly,

HIRAM W. HIXON.

Victoria Mines, March 25, 1907.

The Editor CANADIAN MINING JOURNAL:

Dear Sir,—I notice an editorial in your issue of April 1st in reference to Larder Lake and the difficulty of guaging the commercial value of the prospects in any way from a hand sample.

It may, therefore, be of interest to you to know that we have made arrangements to keep our laboratories open for the entire year, particularly with a view to testing ton and car load lots of such ores by amalgamation, concentration, cyaniding, etc.

This will not doubt be of considerable value in determining the treatment process necessary, but in connection with such free milling ore as the Larder Lake, it will be of greatest use in determining the average of a large tonnage of ore and making an actual bullion return.

Yours truly,

S. F. KIRKPATRICK.

Professor of Metallurgy, School of Mining, Kingston.

School of Mining, Kingston,
April 8th, 1907.

Editor CANADIAN MINING JOURNAL, Toronto:

Dear Sir,—The following may be of some interest to you. The writer had submitted to him a sample of rock, supposed to be talc of soapstone. In appearance, feel, cut, etc., it gave every evidence of being talc. More for the satisfaction of getting its exact composition, than because of any suspicion that it was not what it appeared to be, analysis was made of it. To the writer's surprise, instead of magnesia, alumina was found.

The complete analysis was: Silica, 65.60 per cent; alumina, 28.80 per cent.; ferric oxide, practically absent; lime, practically absent; magnesia, practically absent; water (by difference) 5.60 per cent.; total, 100.00 per cent.

The sample was then tested with cobalt nitrate, which gave a good blue color. So that, instead of talc, it proved to be pyrophyllite. Whether it would serve the same purpose as talc is a question. As far as the use of talc in lining furnaces, etc., is concerned, the pyrophyllite should be better, as being a silicate of alumina one would expect it to be more refractory. Possibly you or your readers can, through previous experience, throw some further light on the subject.

Yours truly,

NORMAN HOLLAND,
Superintendent McCaskill, Dougall & Co.,
Varnish Manufacturers, Montreal.

In the tantalum lamp, a very fine tantalum wire is used instead of a carbon filament. The tantalum wire has a length of two feet, and but half the current is needed to produce a light of the same intensity as that of the ordinary incandescent lamp with a carbon filament. The light is so much brighter, and the life of the lamp is so much larger, that a saving would be effected in paying one dollar for a tantalum lamp, even if one could get the carbon lamp for nothing.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

The prospects for continued peace of the Springhill collieries is rendered doubtful by the action of the union men in trying to force the non-union men into the society known as the Provincial Workmen Assocciation, or out of the town. As the non-union workmen form a small, a very small, minority, trouble will in all probability result. The management maintain a strict neutrality. It is to be hoped, for the welfare of all concerned, that the works will not be interfered with. It is difficult to understand the union men's contentions. It is well known that when a strike is declared in Springhill, very few "scabs" are in evidence. A few driver boys have even been known to stampede the whole working force. When men are so subservient to union rules it seems obsurd to dub them non-union men, even if they have not joined the society. There would appear here little left to differ about.

The collieries at Springhill are in full operation again. The uneasiness caused by a small section of gob heating in No. 3 mine has completely died out. The prompt action taken in "shutting off" the affected district and thorough ventilation of the recovered sections, all tended to inspire confidence in the perfect safety of the mine. The number of workmen at work in this mine at this date is slightly in excess of the number employed at the time of the "scare." The thickness in this seam, "the overlying seam of the series," varies from 4 feet 6 inches to 11

feet 6 inches.'' The coal is of good quality and easily worked. The system adopted in working is ''board'' and pillar. The depth of stope is 4,500 feet, with a grade of 30 degree average.

GLACE BAY.

Glace Bay, 30th March.—The Provincial Workmen's Association is at present pursuing a very aggressive policy in the colliery lodges around Glace Bay, but the recent endeavors to augment the membership has not been marked by the cautious wisdom which has for some time past been a distinguishing feature of the P. W. A. propaganda.

The lodges have adopted the plan of naming a day by which all men employed at any one mine must join the P. W. A., giving notice that otherwise they will close down the mine and refuse to work with non-union men. Following the success of this method at the No. 3 mine of the Nova Scotia Steel & Coal Company, at Sydney Mines, notice was given at Dominion No. 1 that after the 19th of March the P. W. A. men would refuse to work with non-union men. After a two days' stoppage of the mine, practically every man came into the union, and the men signified their readiness to return to work. The Dominion Coal Company had previously given warning that they could not countenance the closing down of their mine in this way, and that if this step was taken the mine would be closed for repairs. This was done, and No. 1 is now undergoing a much-needed overhaul, having been running without interruption since operations commenced after the fire.

The attitude of the Coal Company in this matter has been clearly defined by the management, and appears to be a perfectly proper and natural one. They gladly recognize the utility of the P. W. A. as a means of dealing with their men as a body, and as a channel for the proper representation of grievances, but they cannot allow the ''closed shop'' in their mines, nor any policy that would interfere with the independence and individual rights of their workmen. The action of the Dominion Lodge was further a direct violation of the terms of the ''Three Years Contract'' which has hitherto been loyally observed by both the men and the Company. Judging from the ease with which the non-union men were induced to enter the P. W. A. it is evident that judicial moral suasion would in all likelihood have achieved the same end, and it appears to be generally recognized that the action of the Dominion Lodge was somewhat hasty and ill-considered.

The output of the Dominion Coal Company's collieries for March this year was lower than it has been for the past five years, the weather delays having been of a quite exceptional nature. During the larger portion of the month snowstorms followed snowstorm, all of them accompanied by high winds and heavy drifts, and traffic was more or less interrupted during the whole month. The blizzard of the 7th March is said to have been unprecented in the meteorogical annals of Cape Breton.

QUEBEC.

The asbestos properties of the Glasgow & Montreal Asbestos Company and the Manhattan Asbestos Company, in Black Lake, were recently sold to Mr. H. M. Whitney, of Boston. These properties, which adjoin, are considered valuable asbestos-bearing territory, but the lots were too narrow to admit of their being operated advantageously as individual properties. As a result of the present consolidation, both properties will be operated from one central machinery plant, while the number of pits will be limited, perhaps, to one or two. As space for dumping ground on the property of the Manhattan Company is limited, it is equipped with a tramway 3,000 feet long, over which all the waste rock will be carried to Cariboo Lake. The new company is meanwhile replacing the old plant on the properties with new equipment for mining and separation. Mr. H. M. Whitney also owns the King Bros. mine in Thetford, the largest asbestos producing property in Canada, and the American Asbestos Company, in Black Lake. The Standard Asbestos Company, operating at Black Lake, has disposed of about 300 acres of its asbestos land to an American syndicate, and a 100 ton separation plant will be erected shortly on the premises.

The Bell Asbestos Company, of Thetford, formerly controlled by British capital, was recently taken over by Americans, the property having been acquired by a manufacturing firm at Andles, Pa.

Mr. Martin, of New York, a well-known operator of asbestos mines, exercised the option which he held on an asbestos property in Tingwick. After a thorough test, by means of pits, a small asbestos refining plant was also installed at the property.

By recent changes in the ownership of a number of the largest mines in the asbestos region, the asbestos industry is now largely controlled by Americans, who own the more productive properties. There will shortly be in operation fourteen properties, of which one-half are American owned, six being held by Canadians and one under British control.

COBALT—THE FOSTER MINE.

Cobalt, Ont., April 10.—The mine is located on the southeast part of the north half of lot 4, concession 4, Coleman township, and consists approximately of twenty acres land and twenty acres water. The water takes in the middle of Glen Lake and the northwest corner post is on the north shore of the lake.

COBALT LAKE
Showing new buildings, Cobalt Lake Mining Company

The land lying on the south shore of the lake consists of a knoll of conglomerate, overlying the Keewatin series, the contact dipping northwest. There are diabase and Huronian and Keewatin contacts approximately parallel to the shore of the lake.

Eight veins have been exposed by stripping.

No. 1, on the lake edge, yielded several cars of high grade ore in 1905, strike northwest, and was worked by an open cut seventy feet long and thirty feet deep; vein four inches wide.

No. 2. In the Huronian. Strikes northeast. Vein from two to six inches wide. Two shafts have been sunk 120 feet apart, and 73 feet and 78 feet deep. Connecting drift is at 47 foot level, 180 feet long, and the ore has been partially stoped above this drift and also underhand along a Keewatin contact. Shafts 5 x 5 and 6 x 9, round timbers and cribbing.

No. 3. Strike a little west of north, close to Lawson boundary, and worked by an open cut 60 feet long and 30 feet deep.

No. 4. Northeast strike. Small shaft, 25 feet deep, vein one inch to two inches wide.

No. 5. Large, well-defined silver and cobalt vein, northwest strike. In places, 14 inches wide on the surface. Shaft at west end of vein sinks 72 feet, and drifts northwest and southeast are being driven at 70 feet. Present lengths of drifts, 60 and 20 feet, respectively. Shaft is 8 feet x 4 feet 6 inches in the clear, and is timbered with square sets and will be used as the main hauling road. A cage is on the ground and will be used on arrival of a large hoist, now on order. Thirty foot gallows frame is erected, and shaft house is being completed.

No. 6 shaft, 5 x 8 feet, 78 feet deep, round timbered and cribbed; 20 foot gallows frame and shaft house completed, 5 x 6 hoist, operated by air, installed in small engine house. Strike, northeast; vein, two to five inches wide. Drifts at 65 feet. Northeast drift, 80 feet long; southwest drift, 127 feet, cut No. 5 vein at 123 feet. Drift northwest on vein No. 5(east end) is now in (30 feet). A small stope is being raised on southwest drift, No. 6.

Nos. 7 and 8, northeast veins, parallel and close together, about one inch wide each, showing bloom and silver.

The equipment consists of an eight drill air compressor, built by Allis-Chalmers-Bullock Company; two 60 horse-power Ames boilers; Knowles feed water heater; Knowles supply pump, delivering into 5,000 gallon tank at an elevation of thirty feet above engine room floor; Knowles duplex feed pump; four k.w. direct

COLONIAL MINING COMPAN

acting Allis-Chalmers-Bullock engine and dynamo; one 8 1-3 x 10 hoist; two 5 x 6 hoists; three air receivers; eight 3 inch air drills; one 2 1-4 inch air drill.

The buildings consist of No. 5 shaft house, No. 6 shaft house, cobbing house and ore shed, smithy; power house, 50 x 30 feet; power house, 10 x 12; thaw house; store house, 20 x 24; barn; office building and manager's house, 24 x 30; dining camp, 80 x 24, ice house and three sleep camps. Mine houses are all sheathed with galvanized iron. Office and dining camp are boarded, painted and shingled. The buildings are supplied with water works and steam heated. One hundred feet of fire hose and five hand extinguishers, to provide against risk of fire.

Two thousand cords of wood have been cut and stacked, and no difficulty is expected with fuel this year.

The Temiskaming & Northern Ontario Kerr Lake branch has been started, and should be through by the fall. It crosses the property at the southeast corner.

Montreal River.

Considerable interest is being taken in the recent discoveries of silver and cobalt in the Montreal River district. The area at present being prospected is to the north of Lady Evelyn Lake, on both sides of the Montreal River, and as far north as Smythe township, and including the townships of James, Tudhope, Barber, Auld and Smythe. The area to the west is in the Temagami Forest Reserve, and it is necessary to have a special permit to carry on prospecting and mining.

The Montreal River is a navigable stream for small steamers from Latchford to Pork Rapids, or a distance of eight miles, where there is a short portage; then to Mountain Lake by another steamer line. Thirty miles from this point the river opens out into a series of long lakes, one, Elk Lake, is now attracting a lot of attention, owing to the silver finds made in James township.

At the time of the writer's visit there was two feet of snow on the ground, and it was only in the higher parts or ridges that the formation could be observed. Alternate low ridges of granite and diabase outcrop, with a general course of northwest and southeast, or nearly parallel to the Montreal River. It is in the diabase that the silver occurs. Several claims in widely separate parts of James township and Smythe, show calcite veins, in which native silver and cobalt bloom are found. Silver was also seen to the west of James township, and on Maple Mountain, to the north of Lady Evelyn Lake.

Very little can be said about the future of the district yet, except that native silver and cobalt has been found over a large area; the country rock is diabase, the formation in which some of Cobalt's richest mines occur; that the fissuring is extensive, and for the amount of development work done the prospects are encouraging for a permanent silver camp.

A recorder's office is to be established in Latchford for the Temagami Reserve. This will be a great convenience, as extensive prospecting will be done on the Reserve. Already the great influx is showing the faith of the community in this most interesting field.

Latchford once more is experiencing its annual boom, and building lots have again advanced to fabulous prices. Its last year's experience, and also that of Cobalt, should be a lesson showing the distastrous effects of such a policy.

The rich silver strike on the Temiskaming and Hudson Bay property, adjoining Sasaginaga Lake, has been one of the sensations of the week.

Cape Breton.

Some prospecting work is being carried on in the iron areas known as Father McPherson's areas, situated on the top of the Boisdale Hills, in the Island of Cape Breton.

This property has been well known for a number of years, but very little work has been done towards testing it. It is situated geologically in the Precambrian, and the ore is associated with George's River limestones and felsites.

This work is now being carried on by Mr. W. F.Jennison, who controls the property, and the showing thus far is very encouraging. Ore was struck very close to the surface, and crosscut to a width of 20 feet. A shaft was put down on it 30 feet deep, and found the same width of ore. The sinking of this shaft is being continued.

Shipments are being made to the Nova Scotia Steel Company. This is practically the first development of low phosphorous ore that has been discovered here. Phosphorous runs as low as .006 and iron as high as 58.42. It carries sufficient lime and magnesia to flux the silica. The situation has an elevation of 650 feet above the sea level, and is only half a mile from the Bras D'Or Lakes. Its position is ideal, either for railroad or water shipments, and is only 21 miles from the plant of the Dominion Iron & Steel Company, Sydney.

Mr. Jennison is now putting in steam pumps, hoists and drills. This, with an ærial tramway to railway, will make a complete equipment by which he can handle the ore at a very reasonable cost. We are looking forward for this property to develop into an important mineral industry of the island.

MINING NEWS

After hot debate, the Western Coal Operators' Association and the Union Mine Workers of America succeeded in reaching an agreement at their conference in Calgary. The net result is that miners will receive a 5 per cent. increase in the outside wage scale. The agreement stands for one year.

Dr. G. A. Young, of the Geological Survey, will probably be sent to Nova Scotia this summer to investigate thoroughly the occurrence of tin throughout the Province.

The Great Bras D'Or Gold Mining Company, of Middle River, C.B., are tunneling actively on their property. Placer gold, found in small amounts in neighboring streams, led to the exploitation of this area.

Twenty-one cars of zinc and silver lead ores were shipped from Whitewater mines, Kaslo.

On March 21st the eight-hour smelter bill passed its second reading, and was reported in committee on March 22nd.

An Act to incorporate the Cariboo & Pacific Mining, Smelting & Development Company is sought from the Provincial Government by Messrs. Edgar Bloomfield, R. G. Spinks and G. C. Van Horne, of Vancouver. The capitalization of the company is to be $1,000,000, in ten thousand shares of $100 each.

The Hamilton Iron & Steel Company are providing for additions to their present plant, involving an outlay of $350,000. The capacity of the blast furnase will be increased, and the steel mill enlarged.

A 40-drill air compressor, ordered by the Dominion Copper Company, is soon to be installed. It will have a delivery of 937 cubic feet per minute.

The new hoist at the Centre Star mine, Rossland, is the largest of its kind in Canada. It is designed to hoist ten tons from a depth of 2,000 feet.

The entire output of La Roi mines, some of which has hitherto been shipped to Trail, B.C., will now be sent to the Northport smelter.

Yukon, March 16th.—Acting Commissioner J. T. Lithgow, on his recent return from the Twenty Mile country, reported great activity there on the part of the Consolidated Company. Wafer power plants are being installed, flumes constructed and roads and telegraph lines constructed.

The Klondike Mines Railway is hauling 200,000 feet of lumber from North Dawson to the Guggenheim Consolidated dam, above Discovery or Bonanza.

Material for a large dredge, which is to operate in Walker's Fork, has been assembled in Dawson. Mr. W. J. Hunter is superintending the freighting, and will be in charge during the coming season. The dredge has a five-foot bucket and a capacity of 2,000 cubic yards per diem. It will be ready for work about June 1st.

Fort William is now supplied with power from the Kakabeka Falls on the Kaministiquia River, 25 miles west of Fort William. The power is electrically transmitted by two lines. The generating and distributing machinery was manufactured and installed by the Canadian General Electric Company.

At Fort William and Port Arthur a large number of industrial plants are under construction, or are being projected. Among these are the Atikokan Iron Company, the Canadian Northern Coal & Ore Dock Company, the Canadian Iron Foundry Company, and the Northern Steel Company of Collingwood. The last named company are negotiating for the erection of a plant for manufacturing wire and nails.

The Laurentian Mine, Manitou, has been equipped with a new pump of 500 gallons per minute capacity. The 20-stamp mill will run double shift in future.

Kenora, April 3rd.—The Mikado Gold Mine is being unwatered for examination. It is under option to Mr. R. H. Ahn.

Many complaints are heard of wholesale blanketing in the Montreal River district. A prospecting license allows its holder to stake three claims, and no more. Licenses are, however, pooled; and men are despatched to the field holding ten, twenty, or even thirty licenses. Hence the fly in the ointment.

The Dominion copper smelter, near Greenwood, is being remodelled and renewed. An electrical blower is to be part of the eqiupment. The reorganized plant, it is expected, will be capable of smelting about 1,400 tons of low grade copper ore daily.

A company, under the title of the Vancouver Copper Company, Limited, is being organized to re-open the Lenora Mine at Mount Sicker. The consulting engineer is Mr. Cecil M. Bryant, A.R.M.S.

The Provincial Workingmen's Association has been carrying out its policy of forcing non-union men to join its ranks. Serious delays have been caused within the past year at Westville, Springhill, Sydney Mines and Glace Bay. At these collieries the union men stopped work until the non-union men had either joined the association or left the country. Dominion No. 1 colliery is idle now on this account, and further complications are threatened. The company stands for "open shop," and to this the men are strongly opposed. One significant fact is that the new labor law defines a strike as "ceasing to work."

The sixth annual meeting of the Nova Scotia Steel & Coal Company was held in New Glasgow on March 27th. Mr. Cantley's report for 1906 was very interesting, showing increases in all branches. It also showed that the plant of the company was in a high state of efficiency, and development work at their mines well up to the standard. President Harris went fully into the financial standing and future policy of the company, and stated that the management was exploring their submarine area at Wabana, and favorable results were anticipated, as they expected soon to strike the ore in paying quantities. He also stated that there was sufficient ore in sight at Wabana mines to supply the blast furnaces at Sydney Mines for twenty-five years.

MEN AND MATTERS

The late Commissioner of the Yukon Territory, Mr. W. W. B. McInnes, has been engaged by the Guggenheims to look after their interests in the Yukon.

The Dominion Coal Company have appointed Mr. Angus W. Macdonald as employment agent, thereby creating a new office, which has become necessary, owing to the large increase in the number of employees consequent on the increased coal production. Mr. Macdonald has filled a similar post with the Dominion Iron & Steel Company for the past six years.

We are glad to learn that Mr. A. P. Low, the Director of the Geological Survey, has so far recovered from the effects of his recent severe illness that he is now able to travel. Mr. Low left Ottawa on a visit to the South on the 4th of April. He is expected to return towards the end of the month.

Mr. John Knox, formerly in charge of mines at Camborne, B.C., was recently appointed underground mining superintendent for the Calumet and Hecla.

Mr. J. D. Kendall, well-known to many of our readers in British Columbia as for many years the resident partner in Vancouver of Bewicke, Moreing & Company, returned to England from a visit of inspection to the Cobar mines, New South Wales, Australia, of which he is a director and consulting engineer.

The election recently of our foremost geologist, Dr. Frank D. Adams, of Montreal, to fellowship of the Royal Society is a well-earned tribute to and recognition of the eminent attainments of a Canadian scientist, of whom the Dominion has right cause to be proud. In congratulating Dr. Adams, we congratulate ourselves.

Mr. Thomas H. Drummond, late general manager of the Dominion Copper Company, B.C., has been engaged by the Nipissing Mines Company, Cobalt.

Mr. H. Harris, formerly superintendent of the Hall Mining & Smelting Company's plant, has accepted a similar position at the Brown-Alaska smelter at Prince of Wales Island, under General Manager Thomas Kiddie.

Mr. J. H. Plummer, president of the Dominion Steel Company, went to England late in March.

An exhibition, or, rather, exposition of ores, machinery, mining methods and of every phase of mining operations, will be held at the Grand Central Palace, Lexington avenue, 43rd and 44th streets, New York, from April 15th to April 17th, inclusive. The exposition is under the auspices of the North American Mines Exhibition Company. Mr. Harold P. Davis, who has been arousing local interest in the exhibition, is collecting a large number of Cobalt specimens. Mr. Davis informs THE JOURNAL that show tables will be provided for ores from Northern Ontario. Indeed, specimens from any part of Canada will be welcomed.

Dr. J. Bonsall Porter is about to start west with a party of mining students. His itinerary will include visits to Cobalt, Lethbridge, Frank, Coleman, Coal Creek, Moyie, Nelson, Rossland, Trail, Grand Forks, Phœnix and Greenwood, probably with special excursions afterwards to Sandon and Vancouver. The party will work for about a week in field geology, under the direction

of Dr. Adams, and will then visit mines as above outlined under the direction of Dr. Porter and Mr. J. W. Bell. This excursion is the regular spring session of the mining students in McGill University. A series of such trips has been made in the last ten years. The West has been visited several times, Michigan once, Eastern Pennsylvania and Northern New Jersey twice, Nova Scotia twice, Newfoundland once, and Sudbury and vicinity once.

The appointment of Mr. John W. Bell, M.Sc., as Assistant Professor in Mining Engineering, McGill University, has been announced. Mr. Bell succeeds Mr. John F. Robertson, who has been connected with the University for some years, but who is now resigning to enter engineering practice in British Columbia. Mr. Bell is an old graduate of McGill, and was a member of the staff some years ago, but for the last seven or eight years he has been practising in British Columbia, the Western States and Mexico.

The recent fire has not damaged the McGill Mining Department. The loss in the Departments of Electrical and Civil Engineering is very great, and, in Mechanical Engineering, is considerable. The main engineering laboratories are, however, merely damaged, and by next September they will be in complete working order again. It will take longer to rebuild class rooms, etc., but the authorities expect to make temporary arrangements which will enable them to give full courses next year in all subjects.

Under protest THE JOURNAL publishes the following alleged poem. It is sincerely hoped that the Muse responsible for such an effusion will see the error of her ways:—

The Cobalt and the Silver flies,
The Minerals and the Men depart;
Still stands the Ready Sacrifice,
The Victim of the Fakir's art.
Single or married, young or old,
The Fakir parts him from his gold.

With Stocks and Things the Victim fools;
With Paper and with Promises;
And not a whit his Ardour cools,
He scorns the Doubting Thomases.
But ever what he thought he'd get—
He hasn't yet! He hasn't yet!

Far flung the Dollars disappear;
But still remains the trouble which
Makes ev'ry Fakir's progress clear;
That trouble is the Cobalt Itch.
Fakirs and Itch and Fools, you bet,
We have them yet! We have them yet!

Along with Canada's industrial awakening another manifestation of activity is observable. The poet is rehabilitating himself. No excuses are offered for reproducing these verses, for the simple reason that no adequate excuse can be found:—

My way lies ever far and far,
Beyond the dim horizon;
By day the blaze, by night the star:
I hate a town like pizen.

O'er mountain, gully, barren, swale,
Till worn, and wet, and weary,
I pitch my tent in moonlight pale,
And sleep, and don't feel skeery.

The sun is scarcely risen, when
I rub my eyes and waken;
My meal is as the meal of ten,
'Tis mostly beans and bacon.

As through the day my ringing pick
Makes music on the boulders,
I always hit an extra lick
And straighten up my shoulders,

From thinking of the dusty streets;
Of pavements hot and dirty;
Of people missing all these sweets;
The whole thing makes me shirty.

But when the trail is extra bad,
When hot and spent I stagger;
I must confess I'd swap my wad
For one long pint of lager.

EXCHANGES

The Mining World, March 30th, contains an article on the "Qualifications of the Engineer," by John Hays Hammond.

The Mining Investor, April 1st, is the annual statistical number. It contains many figures of production, etc.

The Maritime Mining Record for March 27th gives an unusually breezy and readable summary of coal mining matters in Nova Scotia.

In The Engineering and Mining Journal, March 30th, the geology of the Ely Trough iron ore deposits is described.

An article on "Rare Metals and Minerals and Their Uses," and a sketch of Cobalt by Mr. John E. Hardman, of Montreal, are outstanding features of The Engineering Magazine for April.

The Coal Trade Journal, April 3rd, in ar editorial entitled "The State of Trade," gives a cheerful prevision of the coming season's coal trade.

The Mining and Scientific Press, March 23rd, contains the second instalment of a very valuable series of papers on "How the Miner's Dynamite is Made."

A description of "Electric Furnaces Without Electrodes" marks The Mining Reporter for March 28th.

The Iron and Coal Trades Review, March 22nd, in discussing the pig iron market, deprecates the pessimisitic tone of a newspaper correspondents and describes the outlook as, at least, cheerful.

"Mining Anthracite by Longwall" is the leading paper in Mines and Minerals for April.

The Bi-Monthly Bulletin of the American Institute of Mining Engineers, among other good technical articles, contains one on "An Early Instance of Blowing-in Without 'Scaffolding-Down.'"

The March-April number of Economic Geology is of more than ordinary importance. "The Relation of Ore Deposition to Physical Conditions," by Waldemar Lindgren is an able exposition.

The Industrial Advocate for March urges the question of greater publicity upon the Nova Scotian public.

Fuel, for March 26th, and The Science and Art of Mining for March 23rd, have been received.

STATISTICS AND RETURNS

The week ending March 23rd saw the following shipments of ore in Southeastern British Columbia districts:—Rossland, 7,403 tons; Boundary, 24,933 tons; east of Columbia River, 2,714 tons.

Nipissing Mines Company.—The financial statement for the eleven months end March 30, 1907, disclosed the following information:—Estimated number of tons produced for 11 months: First-class ore, 11,000 tons; second-class ore, 1,300; cobalt ore, 32 tons. Amount received from sales, including ore on hand, $1,008,000; inventory May 1, 1906, $624,000; total, $1,632,000. Cost of production and all other expenditure, $176,000; net, $1,456,000. Dividends, etc., $800,000; surplus, $656,000. The surplus is made up of the following items: Cash and ore en route and at smelters, $546,000; accounts receivable, $28,000; mining equipment, $82,000; total, $656,000.

Dominion Coal Company.—Output for March, 1907, 210,890 tons; shipments, 153,000 tons, as against an output of 297,958 tons and shipments of 173,000 tons for March, 1906.

Cumberland Railway & Coal Company.—Shipments for the month of March were 27,982 tons.

CANADIAN PATENTS

March 26—104256—B. F. Henry, San Pedro, Cal., and G. W. Drake, Los Angeles, Cal., hoists.

104260—W. S. Gemmer and E. J. Schleecher, St. Louis, Mo., ærial tramways.

104268—A. L. Haines, Ft. Fairfield, Me., conveyors.

104285—W. A. Merralls, San Francisco, processes of cyaniding and apparatus therefor.

104286—W. B. Moore, Seattle, magnetic separators.

104289—W. H. Broughsedge, Ottawa, Ont., gold washing screens.

104289—J. F. Sauerman, Russellville, Ark., ore and coal crushing machine.

104365—W. H. Heard, London, Ont., safety clutches for power driven pumps.

104369—E. P. Mathewson, Anaconda, Mont., blast furnaces.

PUBLICATIONS

In writing for any of the following publications, readers are requested to mention THE CANADIAN MINING JOURNAL.

Catalogue No. 3, of the Montreal Steel Works Limited, is a handsomely printed and bound work, designed to facilitate the ordering of springs, steel castings, switch material and other articles manufactured by the company.

A. O. Norton & Company, of Boston, Mass., and Coaticook, Que., are sending out a neat and instructive catalogue of their ball-bearing jacks.

"Suuction Gas Plants" is the subject matter of a pamphlet issued by the Economic Power, Light & Heat Supply Company, of Toronto, Ont.

The Canadian Westinghouse Company have adopted the "loose leaf" system to their distribution of catalogues. Their customers are supplied with serviceable binders and the catalogue is forwarded on the installment plan as monthly circulars, in which are described the new lines manufactured by the company.

Bulletin 22, being instructions for erecting and running the No. 5 Wilfley concentrator, is being sent out by Mussens Limited.

We would acknowledge the receipt of three handsome and instructive catalogues from the Chrome Steel Works, Chrome, N.J., dealing respectively with (1) Chrome steel stamp mill wearing parts, (2) rolled shells and rings, (3) Canda tempered steel jaw plate.

Messrs. Sheldon & Sheldon, Galt, Ont., manufacturers of drying, heating and ventilating appliances, forge and cupola blowers, exhausters, etc., have adopted the plan of issuing tehir catalogues in sections. These booklets, which are perfect gems of the printer's art, are more than mere catalogues. They are, indeed, text-books on the subject mechanical draft in all its forms. Copies will be sent on application to interested parties.

An exhaustive catalogue, illustrative of the use of the Davis-Calyx diamondless core drill, is number K53 of the Canadian Rand Company Limited, Montreal.

Proper methods for thawing dynamite are explained in a neat booklet published by the Dupont Company, selling agents for the McBeth Fuse Works, Pompton Lakes, N.J. The same people are sending out an instructive folder on exploders and batteries.

"Mine Cages, Skips and Ore Cars" is the title of Circular No. CA-3, a handsomely gotten up booklet, issued by the Wellman-Seaver-Morgan Company, Cleveland, Ohio.

A rather exhaustive treatise, of nearly a hundred pages, copiously illustrated, has been issued by the Standard Diamond Drill Company, of Chicago, covering the history, development and use of the diamond drill.

A handbook and illustrated catalogue of engineers' and surveyors' instruments of precision has been received from C. L. Berger & Sons, Boston, Mass. It is a book of some two hundred pages, and full of useful information in regard to the use of all sorts of delicate scientific and engineering instruments.

The Peabody Coal Company, Chicago, have published a most complete atlas of the shipping mines and coal railroads of the central commercial district of the United States, accompanied by valuable chemical, geological and engineering data. The atlas is 16 3-4 inches by 18 inches in size, 149 pages, is serviceably bound in handsome green cloth covered board, and is printed on paper of excellent quality. The atlas was compiled by A. Bement, and is published at $5.00.

MARKET REPORTS

London, week ending March 23rd.—Copper—The market is still unsettled, but a fresh buying movement is expected. Tough is quoted at £115 10s. Electrolytic at £117 10s. to £119.

Tin.—Large transactions and pronounced movements in values in this market. English ingot tin is quoted at £190.

Lead—After a weak opening, this metal recovered all lost ground; £19 15s. to £20.

Spelter has improved to £26 10s.

Iron and Steel—This market is in good shape. Cleveland iron is quoted at 54s. 5d.

Antimony—£98 to £100.

Quicksilver—£7 per bottle.

Silver—30 7-8d. spot and 30 5-8d. forward. Fine silver, 33 5-16d. spot, and 33 1-16d. forward.

New York, March 27th.—Lake Copper—Per lb., 25 1-2 cents.

Electrolytic Copper—Per lb., 25 cents.

Silver—Per oz., 66 3-8 cents.

Tin—Per lb., 40 1-4 cents.

Lead—Per lb., 6 cents.

Spelter—Per lb., 6 8-10 cents.

EXPERIENCED MINING MAN open for engagement after April 20th, capable of taking charge. Address "Cordova", care of Canadian Mining Journal.

INDUSTRIAL NOTE

The Cleveland-Cliffs Iron Company has placed an order for a 60-drill Sullivan air compressor for its new Maas Mine at Negaunee. Michigan. The machine will be of the Corliss-Cross compound condensing two stage type, with large receiver intercooler. The steam cylinders will be 24 x 46 inches in diameter, with a 48-inch stroke, and the air cylinders 40 x 24 x 48 inches, with a displacement capacity of 4,000 cubic feet of free air per minute at 60 R.P.M., or nearly 5,000 feet at 70 R.P.M. The compressor will be built at the Chicago works of the Sullivan Machinery Company.

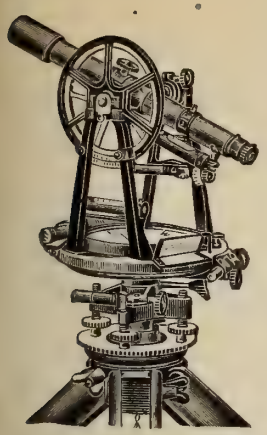
COBALT ORE STATEMENT

Period—March 25th, 1907, to March 30th, 1907. Coniagas Mine shipped to American Smelting & Refining Company, Perth Amboy, N. J., 65,070 lbs.; Nipissing Mine shipped to Nipissing Mining Company, New York, 42,200 lbs.; O'Brien Mine shipped to Canadian Copper Company, Copper Cliff, 81,860 lbs.; Cobalt Townsite Mine shipped to Canadian Copper Company, Copper cliff' 43,000 lbs.; Trethewey Mine shipped to American Smelting & Refining ompany, Per Amboy, N.J., 60,090 lbs.; Trethewey Mine shipped to American Smelting & Refining Company, Perth Amboy, N.J., 41,560 lbs.; O'Brien Mine shipped to American Smelting & Refining Company, Perth Amboy, N.J., 64,130 lbs.; Right of Way Mine shipped to Anglo-French Nickel Company, Swansea, South Wales, England, 3,800 lbs.; Nipissing Mine shipped to Nipissing Mining Company, New York, 75,520 lbs.

TAILINGS

The great English-French-German technical dictionary, begun in 1901 under the auspices of the Society of German Engineers, is nearing completion, and printing is to begin early in 1907. Over 3,000,000 word cards have been collected. Dr. Hubert Jansen, of Berlin, is editor, and about 2,000 firms and individuals in Germany and elsewhere are assisting in compilation.

While the electric furnace cannot compete with other processes in the general production of iron and steel, Dr. R. S. Hutton, the British metallurgist, finds that it may be used to advantage where water power is cheap, and that it has a fairly clear field in the manufacture of iron alloys not easily made in the blast furnace. Many electric plants have been established in Savoy and Isere, in the south of France, the furnaces ranging from 200 to 2,000 horse-power. At Grenoble five furnaces of 1,200 horse-power and four of 2,000 horse-power are used to produce ferro-silicon, ferro-chomium, silico-spiegels of varying composition, and manganese-silicon, and the output is between 7,000 and 8,000 tons a year. The Giraud works, soon to be enlarged, now have an output of about $1,700,000 per year from furnaces of 18,000 horse-power. The product is 5,000 tons of ferro-sicilon of 50 per cent. and 1,000 tons of 30 per cent., 2,000 tons of ferro-chromium, 900 tons of ferro-tungsten, 50 tons of ferro-molybdenum, and 10 tons of ferro-vanadium.



One of the largest blowers ever built in Canada is being built by Sheldons Limited, of Galt, for the Diamond Coal Company of Calgary, for ventilating their mines near Lethbridge.

The blower, which is all of steel, will stand, including foundation work, 27 feet high. It will weigh 14,000 pounds, and will deliver 156,000 cubic feet of air per minute under a pressure of one ounce per square inch. The wheel is 16 feet in diameter and 6 feet wide, and will be driven by a 75 horse-power Westinghouse motor, and, under full load, will make 105 revolutions per minute.

Extra heavy steel is used in the construction of this blower, and it is provided with steel doors and ducts, and can be used either as a blower or an exhauster.

The blower is to be delivered in September.

WANTED—A mine manager who has had 20 years experience in gold and silver mine management wishes to correspond with any mine owner in or near Cobalt, with a view to securing a responsible position in that district. The advertiser has had an especially valuable training in rapid shaft sinking and general development work. Address A. A. A., care of this Journal.

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfo table, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Spring Catalogue will be ready for mailing by the first of March. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our Spring Catalogue for 1907 will be a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend.

Write for it now so as we can have your name on the list in time.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The Attention of Miners and Capitalists in the United States and in Europe is invited to the

Great Mineral Territory

Open for Investment in the Province of Quebec.

GOLD, SILVER, COPPER, IRON, ASBESTOS, MICA, PLUMBAGO, PHOSPHATE, CHROMIC IRON, GALENA, Etc.

ORNAMENTAL AND STRUCTURAL MATERIALS IN ABUNDANT VARIETY

The Mining Law gives absolute security to Title, and has been specially framed for the encouragement of Mining.

All mines belong to the government of the Province on all unsold lands and on all those sold since the 24th of July, 1880, but gold and silver are always reserved, whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such licenses the first right to purchase the mines. In the case of lands where the surface alone is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is $5.00 per 100 acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the government. The purchase price is as follows:

Mining for superior metals on lands situate more than 12 miles from a railway in operation, $5.00 per acre, and on lands situate less than 12 miles from such a railway, $10.00 per acre;

Mining for inferior metals—the price and the area of the concessions are fixed by the Lieutenant-Governor in council.

The words "superior metals" include the ores of gold, silver, lead, copper, nickel, and also graphite, asbestos and phosphate of lime; and the words "inferior metals" mean and include all the minerals and ores not included in the foregoing definition and which are of appreciable value.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

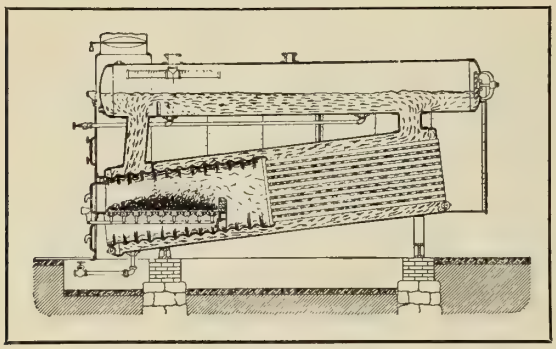
Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within the two years.

Mining licenses giving the right to work the mine and dispose of its products, are granted on payment of a fee of $5.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts. The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the New Grand Trunk Pacific Railway will run.

The government has made special arrangements with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.



The Bureau of Mines at Quebec, under the direction of the Superintendent of Mines, will give all the information asked for in connection with the mines of the Province of Quebec, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

THE HON. MINISTER OF COLONIZATION, MINES AND FISHERIES,

PARLIAMENT BUILDINGS, QUEBEC

SCHOOL OF MINING

A COLLEGE OF APPLIED SCIENCE

(AFFILIATED TO QUEEN'S UNIVERSITY)

KINGSTON, ONTARIO

1. Four Years Course for a Degree (B.Sc.)
2. Three Years Course for a Diploma in

(a) Mining Engineering.
(b) Chemistry and Mineralogy.
(c) Mineralogy and Geology.
(d) Chemical Engineering.
(e) Civil Engineering.
(f) Mechanical Engineering.
(g) Electrical Engineering.
(h) Biology and Public Health.

For Calendar of the School and further information apply to the Secretary, School of Mining, Kingston, Ontario.

McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

WESTERN FUEL SITUATION

As we go to press the reports from the West are disturbing. More than one thousand coal miners are out on strike. The supply of fuel for the railroads is rapidly reaching the vanishing point. A fuel famine threatens the whole West, from Winnipeg to British Columbia. Unless an immediate solution is reached, traffic will be almost altogether stopped, factories closed and smelters shut down.

The president of the United Mine Workers' Union, in responding to an urgent telegram from the Minister of Labour, requesting the miners to await Government investigation, characterized the investigation as a farce, and threatened to "carry this fight to the foot of the throne." The president's intemperate message is the sort of indiscretion that does incalculable injury to the labour cause Instead of attempting in every way to aid the Minister in peacefully solving the difficulty, the miners' representative breathes fire and slaughter. In pursuing this course he antagonizes public sympathy (that most potent factor in deciding any such struggle) and places the body of men whom he represents in a very false position.

Under recent legislation the Minister is endowed with certain powers. We hope that these powers will be used to their utmost in promptly putting an end to this strike. It is iniquitous that the country should be subjected to enormous loss, that many of its most important industries should suffer indefinite suspension merely because the leaders of labour organizations are not amenable to reason.

Whether the fault lies with the operators or with the miners is immaterial. It is an utter anomaly that either corporations or individuals should have it in their power to inflict grave loss and permanent injury upon the country at large. The men, or the corporations, who deliberately tie up traffic and cause a suspension of industrial activity, should be held criminally responsible, and should suffer the full rigor of the law. Canada has had her full share of labour difficulties. It is high time that disturbers of the public peace should be dealt with promptly and severely.

DEVELOPMENT

A new stability is lent to the market for Cobalt ores from the fact that Welsh and German smelting firms are sending inquiries and offers. One mine in Cobalt received an offer of terms as follows: Ore carrying 1,000 ounces silver to the ton, 93 per cent. assay value; ore carrying under 1,000 ounces silver to the ton, 92 per cent. assay value; cobalt under 7 per cent., 20 cents per pound; between 7 per cent. and 10 per cent. and over 10 per cent., from 20 cents per pound to 40 cents per pound. Nickel also is sought at 10 cents per pound on ore carrying over 5 per cent. The opening of a larger market for cobalt and nickel will encourage conservative mining, and will render "gophering" less excusable. Anything that will lead to the sane exploitation and rational development of Cobalt mines at this stage of their history will inevitably lengthen the life of the camp and vastly increase its ultimate value.

CRITICISM

The Mining Journal (London, Eng.), in acknowledging receipt of Vol. I., No. 1, of THE CANADIAN MINING JOURNAL, makes the following comments:—

"We have received from the publishers a copy of the above journal, which, as the reference to an "old series" indicates, is our old friend, the "Canadian Mining Review" masquerading in new clothes. Right here, to adopt the Transatlantic idiom, we desire to make a protest. A journal with a well-recognized name does not change its title without careful consideration, and the choice of a name so similar to our own raises the inference that the proprietors look upon the certainty of confusion as desirable. In fact, they go so far in the first number as to refer to their paper as 'THE MINING JOURNAL,' *sans phrase*. Such action would in this country be preventible by injunction, but, of course, as matters stand we have no remedy. The practice is analogous to the action of the company promoter who, encouraged by the success of a well-known mine, adopts a title which is as close an imitation as he dare, and which is often the only asset of value which the concern possesses. We do our best to avoid inflicting any personal matters upon our readers, but the action of our resuscitated contemporary's proprietors, with the whole English language open to them, of selecting the title they have leaves us no alternative but to protest against what we can only regard as an unfriendly act."

We regret that our respected contemporary has so far forgotten the laws of courtesy as to indulge in this somewhat painfully plain language. We are sure that upon mature reflection it will regret this hasty judgment.

THE CANADIAN MINING JOURNAL at its inception was entirely distinct from "The Canadian Mining Review." The former name was chosen for the new venture for no other reason that that it was conveniently distinctive and short.

The publishers have aimed at producing a sound representative and (so far as may be) attractive technical magazine, with an individuality of its own. The absorption of "The Canadian Mining Review" modified the original plans only in details.

On the other hand, it is difficult to imagine in what possible respect we could be the gainers in designedly stealing our worthy contemporary's title, or, indeed, any other feature. We are publishing a Canadian magazine, dealing with the mining and metallurgical industries of Canada, and our requirements are of a very different nature from those of the London "Mining Journal."

We have made this rather lengthy explanation because we know that our London namesake is neither frivolous nor irresponsible. We are sincerely sorry to have given it offence. That there is, so far as we are concerned, any cause for this offence, we do not admit, and we are sure that our contemporary will willingly withdraw its hasty condemnation when it has had time to reflect.

COBALT LAKE

The Ontario Legislature has passed an Act validating the letters patent which grant to the Cobalt Lake Company the minerals under Cobalt Lake. This Act has been passed, despite the fact that the Florence Mining Company claim to twenty acres of the lake is now *sub judice* .

Concerning the merits of the case, as between the two mining companies, we have nothing to say. The courts will decide this in due time. The action of the Local Government, however, appears to be at least ill-advised. It is highly questionable, indeed, whether the Government is acting within its powers when it arbitrarily decides a case while it is yet in the courts.

BRUCE MINES

The annual report of the Copper Mining & Smelting Company of Ontario, Limited, submitted to shareholders at the recent annual meeting in London makes, on the whole, excellent reading, and many of our readers will be gratified to learn that with good management there is now every prospect that the historic Bruce Mines will ere long be placed on a permanently profitable footing. Actual mining was not commenced before last August, and during the four months following 3,371 tons of ore were raised, and 1,295 tons left in the stopes, the gross profit on which is estimated at $34,000. It is expected that the concentrator will be in operation early in the summer, and that 30,000 tons of ore will be treated, averaging in value $10.50 per ton. The company propose to send their product for treatment to the Sault for the present, but the erection of a smelter on the property is under contemplation. Last autumn a number of important new discoveries were made at the mine, including a lead of bornite, some two miles distant from the main workings. At the conclusion of his speech to the shareholders, the general manager referred to the negotiations that are now proceeding for the extension of the seventeen miles of railway from Bruce to connect with the Grand Trunk Pacific to Hudson's Bay, through an important timber and mineral area. He expressed the opinion that the development of this line would undoubtedly enhance the value of the company's property and tend to make the town of Bruce an important coaling and mining station.

CONSOLIDATED MINING AND SMELTING CO.

The showing made by the Consolidated Mining & Smelting Company of Canada, since the consolidation was effected some two years ago, is eminently satisfactory, and we extend to Mr. W. H. Aldridge and his staff hearty congratulations thereon. The distribution of profits in the form of dividends to shareholders during the period mention has aggregated the large sum of over half a million dollars, and a sixth dividend of 2 1-2 per cent., payable on May 1st, has just been declared, which increases the total to nearly $700,000. While the advance in the price of metals has, of course, largely facilitated the profitable operation of the mines, the result is also in a great measure due to the economies effected by the consolidation and subsequent good management.

EDITORIAL NOTES

A press despatch states that the miners at the Fernie collieries have, by a large majority vote, decided in favor of a strike. This will mean the general suspension of mining activity throughout Southern British Columbia until the dispute is settled. The metalliferous mining industry, which was never in a healthier condition, is thus at the mercy of an aggregation of coal miners, largely foreigners, and dominated by an alien labor organization with headquarters in the United States. Such a state of affairs is altogether intolerable and calls loudly for remedial legislation. The strike is ostensibly based on a number of minor differences, but the real object is to force the owners to recognize the principle of the "closed shop."

Mr. George Otis Smith has been chosen as the new Director of the United States Geological Survey. It is significant that Mr. Smith is but thirty-five years of age. He has, however, served for fourteen years on the Survey. The Canadian Mining Journal wishes Mr. Smith a long and useful tenure of office.

The Premier of British Columbia took a very wise step in announcing the imposition of a tax upon all iron ore exported from the Province. Both this tax and the bounty on native ore smelted will operate to encourage the erection of smelters in the Province. There is no reason why British Columbia should not have a thriving iron industry.

The Atlin Claim of March 30th, in an editorial headed "False Stampedes," condemns the spreading of exaggerated rumors of gold finds. It refers particularly to the report that the richest strike made in Alaska had been discovered on the south fork of the Kuskokwin River. While it does not deny the actual discovery of gold, The Atlin Claim deprecates the overdrawn accounts of the nature of the strike, and predicts hardships and privations for many disappointed prospectors.

THE PRACTICAL MINING MAN

In these degenerate days a trademark, or a catchy phrase, possesses a very positive value. Thus, bad butter, carefully decked and labelled "Fresh Dairy," may command a larger market than the paler, purer article straight from the farm. Patent medicines, concocted of alcohol and incidentals, christened with an attractive name, are eagerly bought.

In the business of mining these snares and delusions have their counterparts. Of the *bona fide* practical man the public hears but seldom, or never When he is heard of, it is mostly in connection with smelter returns, or mine output, or in some such prosaically profitable manner. Like most common mining men, he must earn his living and do a minimum of talking. This is the genuine, undecorated brand.

But there is another brand, a variety that announces to all the world that he is a "practical miner," and that, knowing the business of mining from Alpha to Omega, he is the safest and surest guide for the purchaser of mining stock.

We wish to condemn no one. But it is worth while to observe carefully that the mining man, the practical man, who is following the profession of mining, and who possesses the confidence and respect of his fellows, is, of all men, least given to blatant self-advertisement. The practical man has every right to protest against the sinful misuse of his title.

SINKING THE ALLAN SHAFTS

(H. E. Coll, M.E. Paper read before the Nova Scotia Mining Society.)

Description and Location.

The Allan Shafts are located in the north end of the town of Stellarton, Pictou County, N.S., and are 1,000 feet from the old Ford Shaft. They were sunk with the idea of cutting the Ford, Cage, Third and McGregor seams on their basin and lowering the north and south coal by means of balances or chutes to the shaft level, thence up the shaft to the surface.

It was decided to make both shafts the same size compartments, guides and timbering, and to place one 350 feet north of the other. In this way whichever shaft proved the most suitable could be utilized as the main hoisting plant.

The size of the shafts is 12 feet 4 inches by 24 feet, outside of timbering. All timbering is of Florida yellow pine, and the dimensions and joints are shown by the accompanying plan. Each shaft is divided into two hoisting compartments, 6 feet 10 inches by 10 feet 4 inches, and one air-way 6 feet 10 inches by 10 feet 4 inches. The air-way is separated from the middle hoisting compartment by two thicknesses of 1 inch yellow pine groove and tongue flooring, having end joints and side joints broken and overlapped.

Equipment.

Head Frames.—A head frame at each shaft was constructed 44 feet high to a centre of a 5 foot sheave wheel. The details are shown in the accompanying blue print. Instead of a brace leg, the head frame was held by two 3-4 inches rope guys that fastened underneath the rear cap piece, and at the other end were attached to concrete dead men. All hoisting was done in the centre compartments. These head frames were light and easily built, yet answered fully to the rough service given them. In fact, the one at No. 2 shaft is still in use, as by making some changes and adding bracing, we have adapted it to coal hoisting in both compartments.

Across the top and close to the rope line a 10 inch by 12 inch by 18 foot yellow pine cap was placed, with the ends extending out 4 feet on each side. This was for the purpose of hanging a 3-4 inch chain 30 feet long, and which ended in an open hook and was used for swinging the buck out in position to dump into the muck car.

A special hook was used in fastening the muck basket on to the rope. It had a spring latch, which would allow the bale of the bucket to enter and then spring shut. In changing buckets, the operator had to open this latch by hand. The buckets were 3.25 feet diameter, 2.5 feet deep, and had a volume of 20.74 cubic feet. Weight of bucket was 700 lbs., weight of muck contained in bucket, 1,900 lbs.

Compressor.—Compressed air was supplied by one class G. Ing. Sar. machine, having steam cylinder 16 inches by 26 inches by 18 inches, and air cylinders 16 1-4 inches by 26 1-4 inches by 18 inches. This machine being air-governed, worked only as the air was drawn from the mains. The capacity of the machine is 1,327 cubic feet free air per minute, delivered at a pressure of 100 lbs.

Drills.—The drilling was done by 8 Ing. Sar. 3 inch drills of the D 24 auxiliary valve class.

Ventilation was supplied each shaft by a 5 1-2 by 8 1-4 Sturtevant steel place fan having a capacity of 20,000 cubic feet of air. These fans were not required during the sinking, except after shooting, when they were speeded up to their capacity in order to clear the shaft of the dynamite fumes.

Power was supplied by two 200 horse-power Sterling boilers, placed midway between the two shafts.

All the muck coming from both shafts was conveyed by means of a specially built dump car to a ravine just south of No. 1 shaft, which made an ideal dumping place, and at the same time was making room for shops and other buildings.

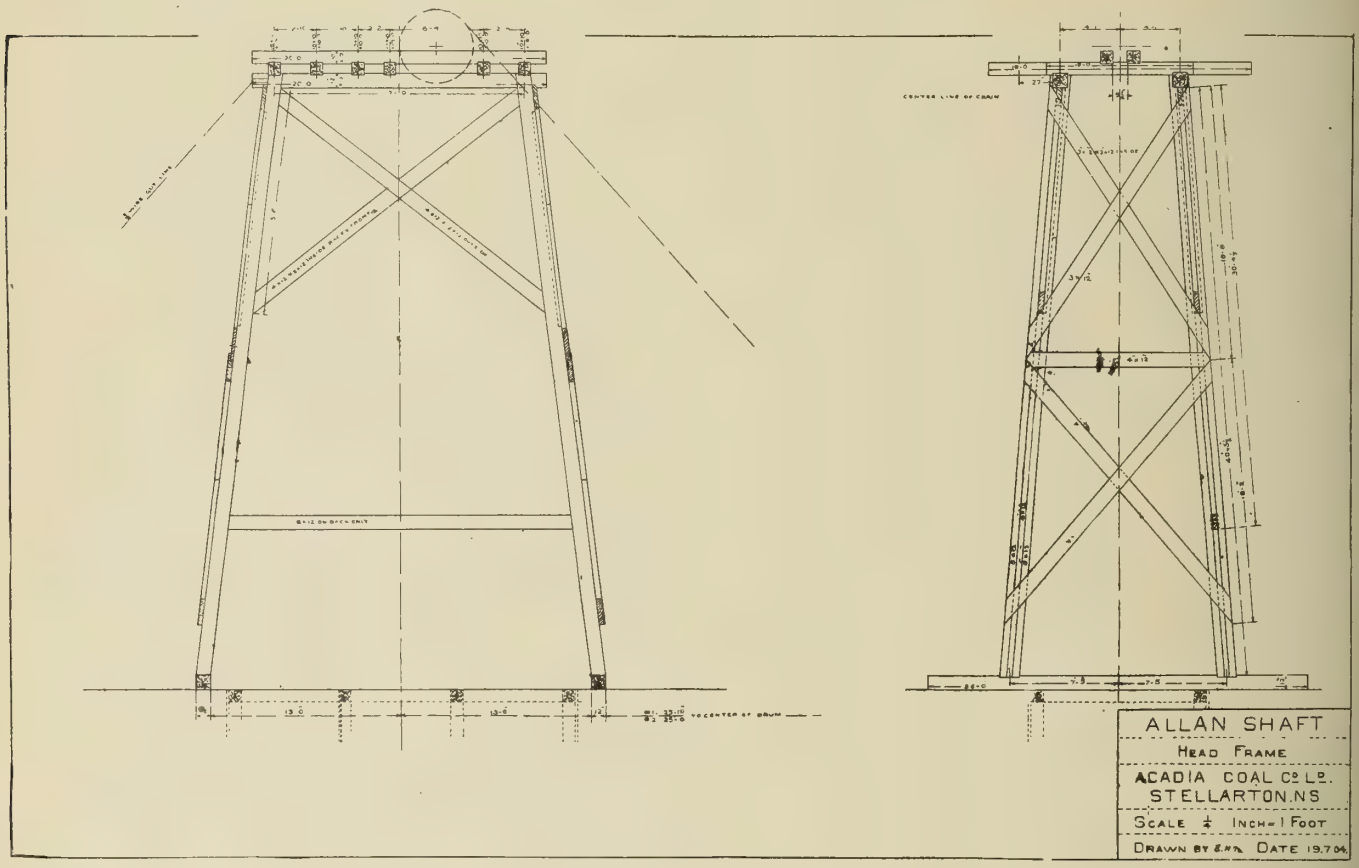
Hoisting Engines.—Thirty-eight feet from the rope centre of each head frame a pair of Lidgerwood friction drums and brake reversible engines, having 10 inch by 12 inch cylinders, and 5 foot drum, were set up on timber foundations and equipped with a 3-4 inch non-twisting wire rope. These engines were only used for a portion of the sinking, as will be shown later.

Labor.—The work was divided into three eight-hour shifts; each shaft consists of from seven to ten men. The shift bosses worked twelve hour turns, and a walking boss had direct control of the sinking in both shafts, and was liable for duty either night or day.

Sinking Operations.

Having given a description of the equipment, we now come to the actual work of sinking.

Ground was broken on April 26, 1904, in No. 1 Shaft, and on May 2 in No. 2 Shaft. As the operations and rock are identical, we will take No. 1 Shaft until we reach the coal.



After going a depth of 12 feet in fairly firm top clay, a bed of gravel was met containing considerable water. A delay of two days was occasioned, by which time an injector had been rigged, which soon had the water under control, and sinking recommenced.

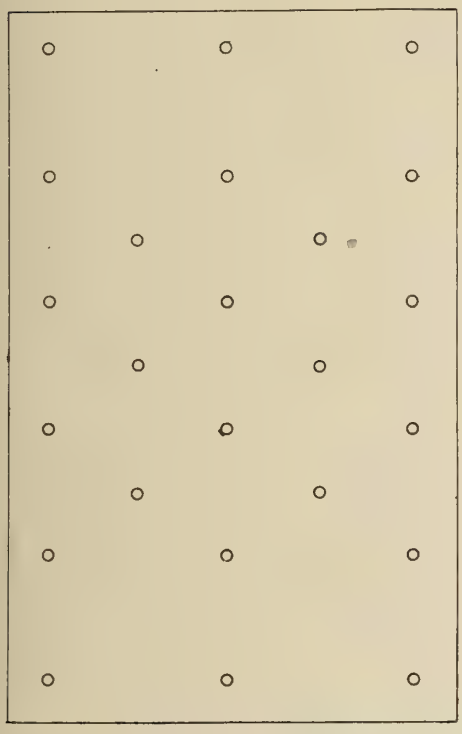
After passing through six feet of loose shale and gravel, and having gotten in place five sets of timber, the sinking passed into very fine sand, and this, mixing with the water and clay from above, made very soft mud. At a depth of 23 feet the walls began to give way, and to prevent this a line of poles 4 feet 6 inches long were driven in a lateral direction, but with no avail. The wall on the southeast end began to sink, carrying the timber with it on that side of the shaft.

Skin timbering of spliced sets was immediately commenced, and, after much difficulty and very slow work, twelve sets were secured in place. At this depth a firm blue clay was met, which proved to rest directly on top of the shale at a depth of 43 feet. Three regular sets of timber were then put in, below which the first yellow pine hitches were placed at a depth of 51 feet.

During the entire month of May only 47 feet had been sunk, and of hemlock timber that had been placed not a single set was in proper position. The east side plates were two feet below the level of the west side, and where the spliced plates had been put in the skin timber, eight of the twelve plate had given way at the splices and were closed up to 10 inches towards the centre of the shaft.

On the whole it was a bad start, and it was decided to go on sinking the shafts, leaving the top of No. 1 remain as it was until the sinking operations were finished. Commencing in June, the sinking was in the regular shale formation lying at an angle 30 degrees from north to south. The amount of water was not heavy, but sufficient for the use of the sinking pump. For this purpose a Jeansville sinker, size 5a, 7 inches by 4 inches by 12 inches, operated by compressed air, was used, and gave excellent satisfaction down to 500 feet depth. At this point it was replaced by a Cameron sinking pump, 12 inches by 4 inches by 13 inches.

Two rings were put in this shaft. The first at a depth of 75 feet, and after sinking further it was discovered we were getting a regular stream below this point, whereupon a second ring was cut at a depth of 200 feet. A pump was placed, and the water has been handled from this ever since. These rings were made by cutting into the rock two feet back from timber line all round the shaft. At the south end a sump was cut four feet deep by three feet wide and the whole lined with six inches of concrete.



Sinking was continued with very little delay, and very little change in the measures, and at this point we will give an outline of the method used in the sinking operations.

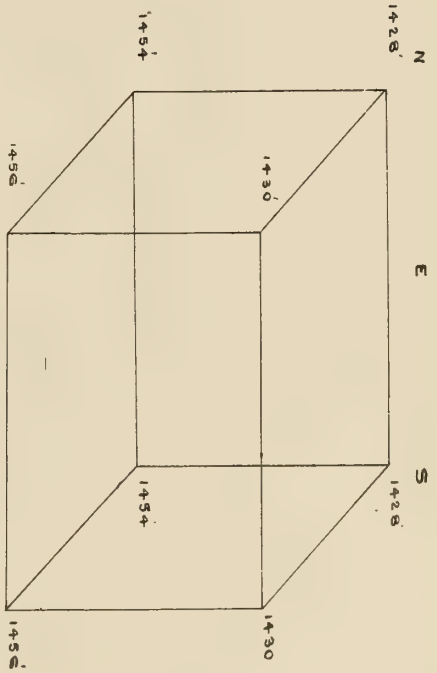
Sinking.—Starting with a clean bottom, two 4 1-2 inch shaft bars 12 feet long would be lowered to the shaft bottom, and set up crossways about 4 feet on each side of the centre line. Four drills were then lowered, one at a time, and two mounted on each bar. The first row of sump holes are started with the machine clamped on the outside of the bar on a slant of about 10 degrees.

All this takes about one hour. The drill steel is handled in big steel cases like large golf bags. Two sets of steel are lowered for the four machines. The air is carried down the shaft in a 2 inch line, with a header on the end having five connections.

While the machines are being mounted, a pair of men take four lengths of 50 foot hose in the bucket and couple them to the header, the drill runner couples on to his machine and is

ARRANGEMENT OF HOLES FOR 1 ROUND OF SHOTS.

AVERAGE CHARGE IS 6 STICKS OF 12" DYNAMITE PER 12" HOLE

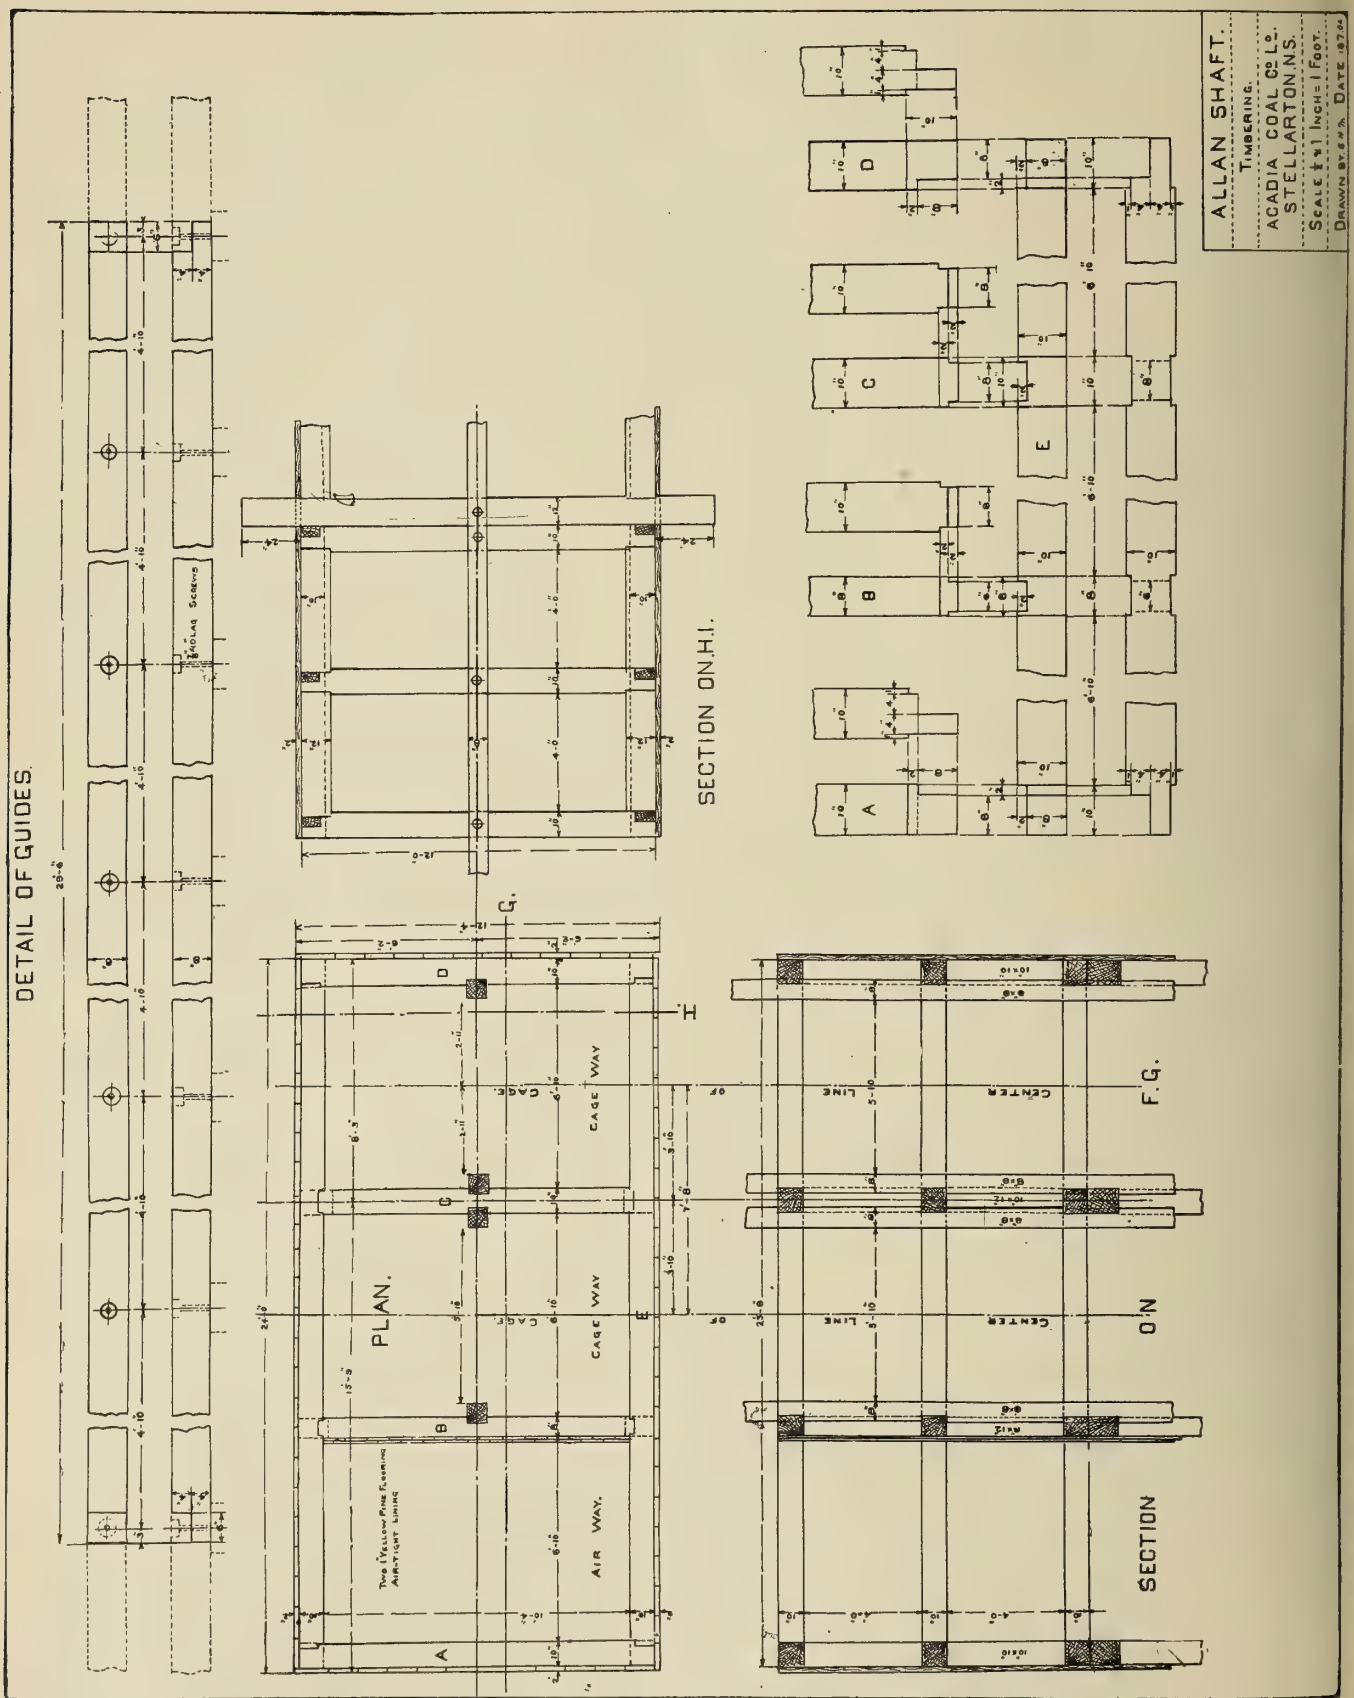


ready to start. It took two men to each machine. The helper mounted the bar and fed the drill, while the drill runner handled the throttle. As soon as the first row of holes were finished the drill was thrown over to the inside of the bar and the second row commenced. There was very rarely over half an hour's difference between the four machines. The average time for drilling a hole was two hours, and for a sump of 12 holes it averaged about 8 hours. As soon as a crew had finished, their machine and gear were hoisted out of the shaft, so that there was little time lost when the last hole was drilled before they were ready to charge and shoot. The average charge was 6 sticks of 12 inch dynamite to each 12 foot hole, or 72 lbs. charge for each sump. Of course there were occasions when more or less dynamite was used, depending upon the area of sump drilled and the quality of the rock as shown in the drilling. The distance from timber, strength of the walls, and the absence or presence of slips, all governed to some extent the placing of the holes and the strength of the shot. All shooting was done from the surface. For this purpose a twin cable wire, mounted on a small reel at the deck head, was provided, and when the holes were loaded this wire was lowered to the bottom and connection made to the connecting wires of the holes. This work was done by two men, all the others being on the surface. As soon as these men came to the surface the battery was connected up and the charge fired. The fan was at once started at its full capacity for about fifteen minutes, when it was reduced to half speed, and the shift boss and one man went down to examine the shaft timbers and remove any loose rock that would be thrown up by the explosion. When the bucket was sent up empty it was a signal all was clear, and the entire shift went to the bottom to muck out.

Two buckets were used, and they were hoisted as fast as they could be filled by eight or nine men. It took from 12 to 16 hours to muck out a sump. When finished, the bars were lowered and set up at each end for drilling the benches. The bar was set about three feet from the end wall, and the first row of holes was put down almost straight. The angle of the second row depended upon the amount of bench to be lifted. Six holes were drilled in each bench, and the charge in the south end was always heavier than on the north, because, owing to the dip, the north side was easier to pull. The holes were then charged and shot, and the muck hoisted out; thus completing a "round," as it was called. The length of time required to take out a "round" varied from 36 to 42 hours. Besides this amount of muck, there were about 500 gallons of water per hour to handle in No. 1 Shaft; in No. 2 it was about half that amount.

Traveller or Crosshead.

In order to keep the bucket from swinging while going up and down the shaft, a traveller, or crosshead, was used. This was made of 6 inch yellow pine frame, with cross braces. The shoes were formed by bolting pieces of plate at each corner, which lapped over past the guides 2 inches on each side. This cross-



PLAN OF THE CAGE SEAM AS STRUCK IN Nº. 1 SHAFT NOV 22 1905.

head rested upon a ring which fitted down over the rope socket, and the rope went up through the centre. In the top guide a dog was placed, which could be tripped by means of a rope from the deckhead. As each bucket came up out of the shaft it was hoisted high enough to set the crosshead upon this dog, then the deckman caught the crossbar of the bucket with the hook of the bull chain, and the bucket swung out over the dump car and was upset. Within a guide length of the bottom of the timbering, a par of heavy angle plates were bolted on to the guide, and the descending crosshead would seat itself on those plates and the bucket would be dropped down to the sump. When the loaded

bucket was picked up it was steadied a few seconds, and then hoisted slowly till the crosshead was picked up.

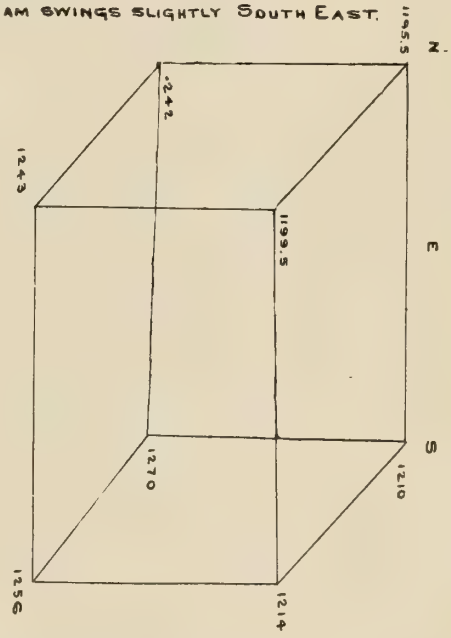
After sinking several hundred feet it was found that the 10 inch by 12 inch hoisting engines were not going to be able to handle the work fast enough from the lower depths. Accordingly, two pairs of engines, 20 inch by 30 inch cylindeers, and having drums 72 inches diameter and 90 inch face, were procured from the Exeter Machine Company, of Pittstown, Pa. These engines were supposed to be good for 4,000 feet maximum speed, but day after day these machines reached a speed of 5,000 feet per minute. This explains why faster sinking was done in the lower and harder measures than during the first half of the work.

Method of Timbering.

When the sinking had been carried down as far as had been considered safe, below the timbering, the distance from the last hitch timber to within about ten feet of the bottom was measured, and hitch holes not less than two feet deep were cut in the walks. When these were ready the hitch timbers were lowered from the surface, placed in position and wedged tight. The two side plates of the first set followed, and then came the end plates and buntons. These came down in rotation, and marked for their respective positions. When all the pieces were in place the set was levelled and then wedged plumb by means of bobs suspended from the last timbering. To facilitate this the centre lines were all scored when the framing was being done. The second set was now lowered, and then plates rested upon the posts until the buntons were in place, when this set was levelled and wedged to place. This was continued till the last, or closing-in, set was reached. In order to get the side plates in position, it was necessary to leave out two buntons of the lower set. These closing-in sets were usually either longer or shorter than the standard, as the measurement could not be made true, and the posts were cut to fit the actual distance and driven home.

The two inch lagging was then placed, and made as near watertight as possible. All spaces between the walls and the lagging were closed with packing. After the timbering was in place the guides were fastened on the centre compartment, so as to keep the crosshead as near as possible to the sump. The guides were not placed in the other compartment until the sinking was completed.

In sinking the first 500 feet, a number of slips and slickensides were passed through, but not of enough importance to show any radical change. At this depth we find the commencement of a very heavy disturbance in the measures. The rock showed plainly that very severe lateral pressure had been exerted, and at two points the dip was reversed for a distance of 15 to 30 feet. Between 560 feet and 580 feet depth, the measures were vertical, and at 595 feet they become regular again for a distance of 50 feet. At this point we ran into a shale, in which the rock was so broken up that the dip was lost. This was followed by 25 feet of vertical measures, which came down and rested upon the shale, running at its regular dip at a depth of 702 feet. From this the shale become harder and was very regular, with the dip tending toward the southeast. We then met with a well-defined layer of soft shale roof, resting directly on top of the Ford seam. In No. 2 Shaft the measures were harder, and lying about 45 degees dip. Instead of dipping southeast, as in No. 1 Shaft, the rock swung southwest. The slips were more clearly defined and of sharper throw, and it became apparent that we would meet coal much sooner than in No. 1 Shaft.



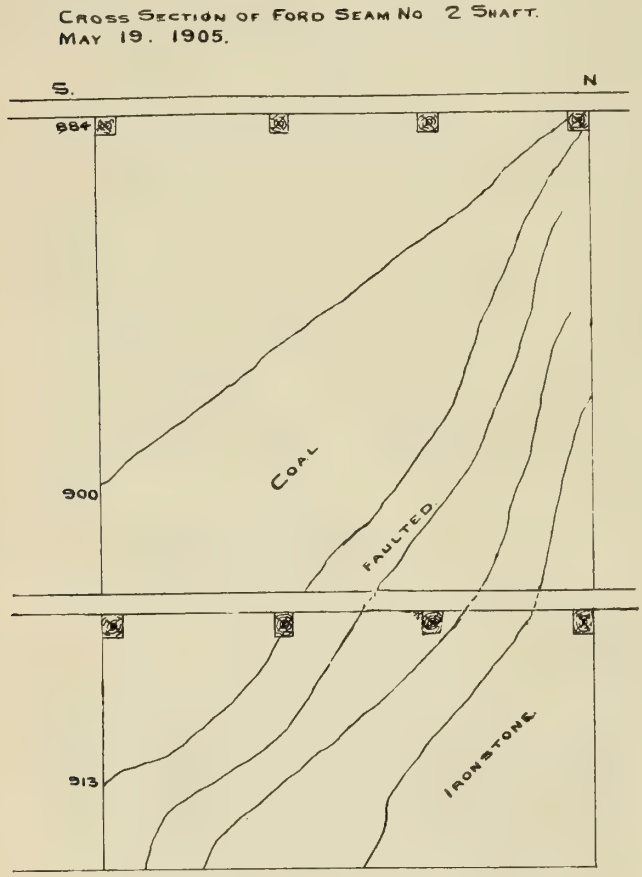
On May 19, 1905, the Ford seam was struck at a depth of 884 feet. The coal entered the northwest corner of the shaft, dipping 50 degrees southeast. The coal was only 6 inches thick on entering, and swelled to 7 feet on the south end. The overlying fault entered on the northwest corner and swung southeast across the shaft, dipping 90 degrees. No water was found with the coal. This is shown by the accompanying cross-section.

Underneath the coal the measures were badly faulted and slipped, and consisted of very tough sandstone, accompanied by several iron bands. As we were not unprepared for this trouble, it was decided to continue sinking to the Cape seam. Deep hitches were placed at the top and bottom of the seam, and work continued. The rock was hard and faulty and difficult to drill; but, on June 27th, coal was again struck at a depth of 977 feet, dipping 45 degrees. This seam showed the same characteristics as the Ford, being pinched to 2 feet in thickness on the north side. A point which greately puzzled us at times, however, was that the coal entered from the northeast side and swung southwest across the shaft; this being opposite from the upper seam, which swung southeast. On the south end of the shaft the coal measured ten feet in thickness, the bottom of the coal in the shaft being 1,005 feet. In order to provide sump room, sinking was continued to a depth of 1,016 feet, which completed No. 2 Shaft on July 17, 1905. Total time occupied in sinking this shaft was fourteen and a half months.

We will now return to Shaft No. 1, which we left at the top of the Ford seam, a depth of 1,195 feet 5 inches. The coal enters from the north side on a dip of 30 degrees, and the bottom of the seam swings southeast. The seam was tapped by the last bench holes on the north end, and it was 16 hours before the drills were again set up, ready to drill the sump. About one foot of coal had been shot out of the north bench; the drills soon reached coal, and the writer can remember some anxious moments, wondering whether we would find nothing but the remnants of the old Ford, as we had in No. 2. The drills fairly raced in the coal, and in one hour they had drilled 12 feet, all in coal. The next round was the same, and for ten days the sinking was carried down in this seam. By that time the anxiety was the other way. At one time as much as 35 feet of untimbered walls of solid coal was standing open to view. The writer believes it safe to say that it was a sight never likely to be seen again. Not a parting band or change of structure in the coal could be found from top to bottom of the seam. Heavy timbers were placed until the rock was reached, when deep hitches were put in. Below the coal there were eight feet of bone and splint, and this rested directly upon the rock. This proved to be dif-

PLAN OF THE FORD SEAM AS STRUCK IN No. 1 SHAFT.

THE COAL ENTERS FROM THE NORTH SIDE AT A DIP OF ABOUT 30 DEGREES AND THE BOTTOM OF THE SEAM SWINGS SLIGHTLY SOUTH EAST.



ferent in character than any previously gone through. It was very hard and tough, and had no definite pitch and no limitation, but seemed to split equally in any direction.

The finish was in sight, however, and it is noticeable that greater speed was made than in the softer measures.

On November 22, 1905, at a depth of 1.428 feet, the Cage seam was struck, with the measures practically flat and about on the axis of the basin. First was a well-defined band of ironstone, 1-2 inch thick, then came 3 feet of clay, 4 inches iron-

stone, 4 feet stone coal, and then the main seam of 22 feet of good coal. As the cross-section shows, the coal has a slight dip towards the east; but this turned out to be only a local condition. Work was continued for 50 feet, in order to get sump room. Rock was hard and lying flat.

On December 9, 1905, operations were finished in No. 1 Shaft. The guides in No. 1 compartment had yet to be put on, and this work was finished December 29, 1905, just two years from the first breaking of ground by the Mayors of New Glasgow and Stellarton.

Powder Used in Sinking the Allan Shaft.

Total amount of powder used, 36,950 lbs., 50 per cent. powder.

Total distance sunk, 2,520 feet. An average of powder per foot sunk equal to 14.66 lbs. Average number of holes per round equals 12 holes in sump, 6 holes in each bench; total, 24. The average charge is equal to six sticks 12 inch dynamite per 12 foot hole.

Number of cubic feet of muck per round of powder equals 48 cubic feet. Number of cubic feet of solid per round of powder equals 22 cubic feet. Number of cubic feet of muck per foot sunk equals 726 cubic feet.

Tonnage Raised.

The total amount of muck hoisted is equal to 83,790 tons, which meant 88,200 trips landed on deck, or an average of 211 trips per day of 24 hours. In addition to this, there was hoisted 18,315 tons of water, which is equal to an additional 66 hoists for 24 hours; making an average total hoisted out of the shafts of 277 buckets per day of 24 hours.

This makes a total weight hoisted out of the two shafts, of water and muck, amounting to 101,105 tons.

To mine and hoist this tonnage required 5,730 tons of coal, or one ton of coal is equal to mining and raising 17.64 tons per hour, equals 569 cubic feet.

So far as we have been able to find out, this sinking stands as a record, considering the size of shaft, amount of muck to be handled, and depth of sinking, also the timbering occasioned by heavy loss in the actual sinking time. In No. 1 Shaft 137, and in No. 2 Shaft 100 days were occupied in timbering alone.

In both shafts there were placed 476 sets of timber and 56 sets of hitches. In considering the data on the works by months, and the sinking per 24 hours, this loss of time from special timbering should be taken into account.

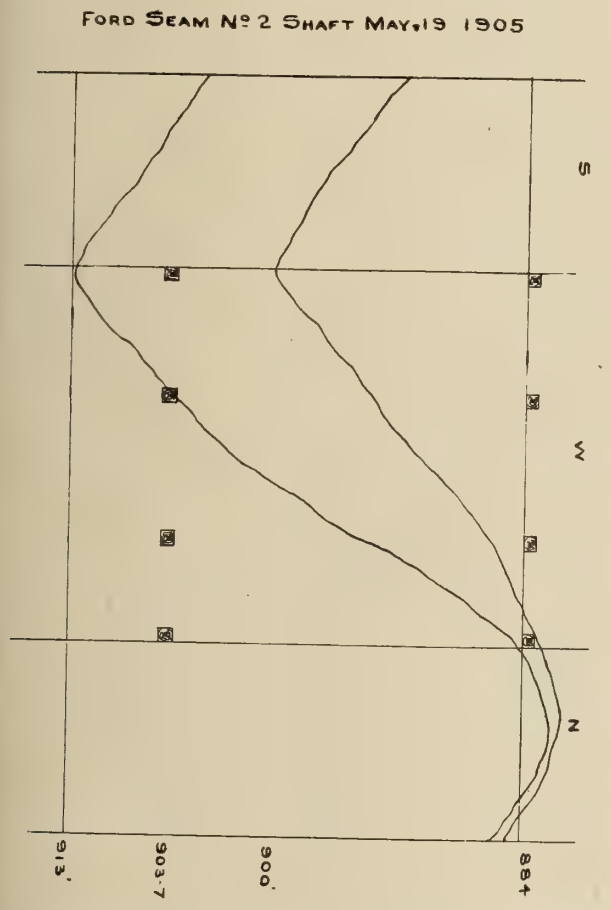
Amung the other uses of aluminium may be mentioned spools and bobbins for textile mill work, household and military utensils parts of vibrating and reciprocating machines, equipments for railway cars, oil cups on locomotive driving shafts, pigment and foil to replace silver and tin, letter boxes, lithographic plates alloys, in pyrotechny as a substitute for magnesium, in pattern-making to replace wood, acid carboys, cash checks, bicycle and motor car fittings, chains for hoisting, and jewelry.

Apart from the electrical industry, in which aluminium is gaining favor as a substitute for copper conductors for the transmission of light and power, there has been expansion in other directions. The steel industry is an important consumer of aluminium. Usually from two to five ounces of this metal are employed per ton of open-hearth steel made, and from six to eight ounces for Bessemer steel. The object in adding aluminium in the casting ladle is to reduce the slag or oxide formed while pouring the steel.

Never in the history of the abrasive industry has the time been more opportune for the development of corundum properties than at present.

Black sand obtained from the shallow ravines and gulches is generally the poorest, and when chiefly composed of magnetite and chromite, often practically worthless.



SOME PARADOXES OF MATTE SMELTING

DAVID H. BROWNE, Metallurgist of the Canadian Copper Company.

In working out the problems involved in smelting copper or copper nickel ores, some interesting principles are involved, which, in their practical application, appear to be paradoxes. A study of these shows the importance of looking below the surface of things to find the true relation of the facts involved.

One of the simplest and best-known paradoxes is that a chilled furnace does not alway need more fuel. Take an ore mixture on which the silica is calculated to produce a 33 per cent. silica slag; and suppose 12 per cent. fuel is all that is required to provide heat for the metallurgical reactions.

Suppose now some condition arises, such as a leaky spout, or a delay at the engines, or any minor accident, whereby the blast is cut off for half an hour. On starting the charge may move slowly, and the foreman with good intent may increase the coke, say to 15 per cent. After a few hours the cupola is delivering a wild irony matte low in copper, and a sticky siliceous slag. This slag runs slowly, forms side accretions in the furnace, and narrows

up the smelting zone. In a little while the furnace is delivering very little matte, and the fire has risen to the top of the charge. The furnace is cold below and hot on top. If it could be turned upside down it might shortly recover; but, as it is, the foreman reports it as "badly balled up."

Now what has happened to it? In the first place, there is passing into the cupola fixed amount of air each minute. The pressure of this may vary; but the volume is nearly constant. This air is primarily to oxidize sulphur and iron, secondarily to burn coke. A copper cupola is an oxidizing machine, and exactly reverses the conditions of an iron furnace. The business of the cupola is to send as much sulphur up the stack, and as much iron into the slag as it can economically. Coke has no function, except to produce heat. In fact, if we could furnish heat some other way than by using coke, we would be much better off. The amount of air blown in is always much more than the coke requires; so that the normal atmosphere of the cupola is intensely oxidizing.

Now when the blast stops, the coke in the furnace is still glowing. It absorbs oxygen from the roast ore. It forms CO, and this in turn reduces more of the oxides. The metallic iron formed immediately absorbs sulphur, and the charge gradually changes to a pasty mass of sulphides of iron and copper, and a residue or skeleton of siliceous rock or slag. On starting the furnace we have a lot of high iron matte and a very siliceous slag. The furnace chokes up; the charge cannot pass through, and the action ceases. More coke used at this point simply melts down the sulphide minerals unchanged, increases the silica in the slag, and in general makes a bad matter worse.

What this furnace really needed on starting was, not more fuel, but a few charges of an easily fusible basic mixture, such as couverter slag, or roast ore and limestone, or any material which is easy to meet and is deficient in silica. Such a charge carries the heat down to the hearth, fluxes off the siliceous accretions, and puts the furnace in good condition without any difficulty. Unfortunately, the average foreman at two o'clock in the morning seems to consider no expedient or remedy for a cold furnace except "a little extra coke."

Another paradox is that high silica in the slag often means that the charge needs more instead of less quartz. For example, a cupola is smelting roasted ore and carrying quartz enough to make a 40 per cent. copper matte and a 33 per cent. slica slag. Some poorly roasted ore comes in from the roast yard. The matte shows hot and irony, evidently low in copper, and the slag is siliceous. The foreman gets nervous; waits impatiently for the cent. matte and 36 per cent. slag. He takes off some quartz from next laboratory report, which confirms his fears and shows 30 per the charge, and waits for the furnace to improve. He was wrong. Why?

Here we must consider again the amount of air going into the furnace. This air weighs, say 4 tons to every ton of ore. It is enough under ordinary conditions to oxidize sufficient sulphur and iron to make the proper matte and slag. We strike a lot of high sulphur ore—we need more air, but the blowers are, as a rule, worked to their limit. We cannot blow in more air actually, but we can do so relatively. That is, we can slow the passage of the ore through the furnace, so that each ton of ore is exposed for a longer time than before to the oxidizing blast. This we can do either by decreasing the coke or by increasing the quartz. Either remedy, or both, may be used as local circumstances dictate. The addition of quartz delays the smelting, allows more thorough oxidization of sulphur and iron, and so brings up the grade of the matte, and by burning more iron into the slag actually lowers the percentage of silica in the slag. In this case the remedy is the old one—"a hair of the dog that bit it."

The intelligence of a cupola is at times almost human. A most interesting illustration is the action of a furnace when working pyritically. Here we have no coke to complicate matters. The blast oxidizes iron and sulphur, and the heat thereby generated melts the charge. Suppose such a furnace in proper order making a 40 per cent. silica slag and a 15 per cent. matte, and the amount of quartz in the charge be increased.

The furnace does not produce slag of higher silica content. It simply takes its time to digest this quartz. It burns more iron from the ore, combines this iron with the extra quartz, makes a little better grade of matte for the time, and produces slag of the same silica content as before. Nature can never be forced. All we can do is to find out the conditions under which certain

reactions occur, and, if possible, supply those conditions.

A nice illustration of this parsimony of nature is shown in the selection of siliceous fluxes. The case often happens, where a mine rock consist of natural bisilicates or trisilicates. The ore itself needs silica and we are aiming, for example, to make a mono-silicate slag. The most obvious thing to do would be to smelt these silicate rocks with the ore. On trial, however, it will usually be found cheaper to pick these high silicate minerals out and supply barren quartz in their stead; even where the mine rock carries considerable copper. These high silicate minerals do not readily split up and form new compounds in the cupola. They may meet and dissolve in the slag, but they do not do the desired work. Barren quartz is an active re-agent, while the higher silicate are acid salts which nature has already built up, at much expense of energy, and nature does not like to undo her own work.

Another curious observation in matte smelting is that high sulphur in the charge does not always mean high iron and low copper in the matte. The condition in which this sulphur exists makes a good deal of difference in its action. Thus, a badly roasted ore makes a lower grade matte than a mixture of well roasted ore and unroasted ore, even if this mixture be higher in sulphur. The badly roasted ore consists of a shell of oxides, enclosing a kernel of sulphides. This coating of oxides protects the ore till it gets down to the smelting zone, where it meuts all at once, and the molten sulphides run rapidly down to the hearth. A piece of green ore, surrounded by well roasted ore, is partially roasted in the upper part of the furnace, and when it gets to the smelting zone it has less sulphur than the badly roasted ore. The charge, consisting of a mixture of well roasted and raw ore, remains open and is well acted upon by the blast, where the badly roasted ore escapes action altogether.

These few instances show that in furnace practise we must consider the operation as a whole, and the furnace as an organism containing many parts, each co-related to the other. By the knowledge of underlying principles, we may often discard the evidence of individual analyses and consider a bad slag or low grade matte simply as a symptom of some deeper seated evil.

A matte furnace is not simply a hole surrounded by water jackets. It is a commercial laboratory, in which a great many different and conflicting analyses and syntheses are going on at the same time. The economic conduct of the work depends on our appreciation of this fact and our understanding of the relation of each part to the well-being of the whole.

THE IRONSTONES OF CLEVELAND

By Arthur E. Pratt, Student.

(A paper read before the Institution of Mining and Metallurgy, London, Eng., April 18th, 1907.)

Geology and Mining.—The Cleveland ironstone occurs in large beds in the Middle Lias formation of the North Riding of Yorkshire. The whole of the Middle Lias is more or less ferruginous, but the upper portion is the most productive. The beds cover a total area of about 350 square miles, but cannot be worked profitably for much more than one-fifth of that area. The beds worked extend inland from Redcar through Upleatham and Eston to Normandy, at which places the seam is thickest and best. To the northwest the bed thins rapidly, but to the southeast it thins very gradually, and dips gently about 1 in 15 in this direction. As the bed extends towards the southeast it becomes parted by bands of shale and pyrites. There is no shale band at Brotton, although there is a difference of color in the middle of the seam, but the stone is not affected in quality by it. The shale, however, appears in Kilton, to the south of Brotton, and Loftus, to the east, and develops to such an extent in the southwesterly direction that is 31 feet thick in the valley of the Esk. Where best developed the bed has a total thickness of more than 20 feet.

The upper seam is generally too silicous to be worth working, and practically the whole of the ore is obtained from the middle or main seam. The top seam of ironstone really belongs to the oolite and immediately underlies the freestone, coming between it and the alum shale of the Upper Lias. It was worked for several years at Port Mulgrave and elsewhere, and is still worked at Rosedale.

The average thickness of the main seam is about 10 feet at the northern part—in the neighborhood of Saltburn. Eastward from Saltburn it crops out at Gluntcliff about 300 feet above sea level, and can be traced along the cliffs overlooking the sea in many places, at Loftus, Boulby, and as far as Staithes. At Port Mulgrave it is about 70 feet below sea level. Inland the seam dips and the cover increases, the deepest pit being about 128 fathoms.

The ore is impure clay ironstone, consisting of carbonate of iron with clay, and calcium and magnesium carbonates, also containing about 1.5 per cent to 1.7 per cent. of phosphoric anhydride, or 0.65 per cent. to 0.74 per cent. of phosphorus.

In color the stone is either a greenish grey, such stone having an oolitic structure, or else bluish-grey, in which case it resembles a mudstone and is not oolitic. The characteristic color of the Cleveland stone is said to be due to the presence of silicate of iron. Some varieties are also red owing to the presence of ferric acid. Fossils are entirely absent from some of the stone, but other varieties are highly fossiliferous. The fossiliferous stone is frequently of a red color. The best fossils were obtained at Eston Mine, near the outcrop, but not where the stone was red.

As raised from the mine the ores contain 20 to 33 per cent. iron, the percentage falling towards the southeast (at Whitby it is only 25 per cent.), while the proportion of sulphur and shale in the lump ore increases.

The term "dogger" is applied both to the seams of shale containing ferruginous nodules and to the nodules themselves. In some places it forms a valuable ore, containing up to 50 per cent. iron. It is magnetic and exhibits polarity, has a greenish-blue or black color and an imperfect oolitic structure.

With regard to the origin of these beds, it is probable that some of the iron carbonate was deposited mechanically, while the greater part was formed chemically by replacement of a bed of limestone.

The Cleveland beds produce 40 per cent. of all the iron ore raised in this country, the average yield per acre being 20,000 to 50,000 tons. In 1903 the output was over 5 1-2 million tons; in 1906, 6,100,000 tons. At the present rate of consumption the best deposits are expected to last for about 50 years.

The ore is mined by a system of pillar-working with temporary pillars. Details and dimensions vary somewhat in different mines, but the following may be taken as a typical example.*

*See "Ore and Stone Mining," Sir C. Le Neve Foster and Bennet H. Brough, p. 334.

From the bottom of one of the shafts a "mainway" 5 yards wide is driven out level, or with only a slight incline. At intervals of 20 yards, drivages, also 5 yards wide, are put out at right angles to the mainway. These are known as "bords." At intervals of 30 yards along the bords, cross drivages are made, which are only 4 yards wide, and are known as "walls." Thus the bed is cut up into a series of pillars 30 yards by 20, while a considerable amount of ore has been removed in making the galleries. The pillars are now attacked, beginning with those near

the boundary and working towards the shaft. A "drift" of 2 to 4 yards in width is worked across the pillar from the bord, cutting off one-third.

From the drift this rectangular portion is removed by drivages, known as "lifts," either two or three in number. While these lifts are being worked away, another drift is driven across the remaining two-thirds of the pillar in preparation for another set of lifts. Sometimes a corner or portion of the side of a pillar is left standing during working to keep out the fallen rubbish beyond, or prevent a too sudden fall of roof. During removal of the ironstone the working place is timbered, but this is subsequently taken away and the roof allowed to fall in.

A very good example of a Cleveland ironstone mine is afforded by the Lumpsey Mine, near Brotton, the average output of which is 11,000 to 12,000 tons per week. The ore from here contains about 29 per cent. iron in the raw and 37 per cent. calcined, and is not of very good quality, but the mine has several interesting features which are worthy of notice.

The shaft is 96 fathoms in depth, and the strata passed through in putting it down were first beds of sandstone and shale, then alum shale, then jet shale, then grey shale with dogger, and finally ironstone. From the top of the alum shale to the bottom of the ironstone is about 240 feet. The main seam at Lumpsey is about 50 fathoms below sea level, and is 9 feet 6 inches thick. All the power used in the mine is electrical, with the exception of that required for winding, which is done by steam. There are three Lancashire boilers (one always acting as a stand-by), with Green's economizer for pre-heating the feed water The pressure of steam is 120 to 150 lbs. per square inch. In the engine house there are two separate engines, high and low pressure respectively, the low pressure engine taking the exhaust steam from the high pressure, and each engine being cranked to one end of th drum shaft.

A pleasing feature underground is the general cleanliness and freedom from water, and also the roomy levels, which one would expect from the nature of the seam.

1. *Gravity Inclines* used in one of the main levels where the stone has to be brought down hill. A rope passes round a pulley at the top of the incline. The full trucks are attached at the top, and by their weight pull up the empty ones from the bottom, the speed being regulated by a brake on the pulley. The line of rails is only double in the middle where the trucks pass one another. These self-acting inclines are worked with one rope, which runs backwards and forwards, and the end that lowers full tubs in one run brings up empties the next, and so on.

2. *Electrical Endless-rope Haulage.*—The outbye pulley (which is a clip pulley) is worked by a motor. The full tubs are pulled up on one line of rails, whilst the empties travel in on another, the rope passing round another pulley, the inbye pulley, at the far end. This is used in one of the main levels 1 1-4 miles long, and double track the whole length.

3. *Horse Haulage* is employed for conveying the stone from the working parts to the main levels. There are large stables underground, with stalls for 45 horses at one end of the mine and 30 at the other end.

4. *Electrical Direct Haulage.*—This is used in one of the levels at the dip side, which has a very steep gradient. The motor drives a drum through belt gearing, and on the drum is wound a single rope, by which full trucks are pulled up and then the empty ones let down. The motor is a direct current Westinghouse machine, 200 to 400 amperes, 220 volts, 200 horse-power, speed on full load 550 revolutions. The rails underground are provided at intervals with rotating axle-greasers for the trucks.

For drilling, both rotary, hand and electrical drills are employed. For blasting, gelignite and similar explosives were found to be unsuitable in action, pulverizing the stone without bringing it down, so compressed pellets of black powder, weighing about 2 ounces each, are used. Blasting gives about 2 tons per hole, and costs 1 1-2d. per ton of ore.

Underground surveying is done with the theodolite, as the miner's compass is affected by the doggers.

At the shaft head, the methods of dealing with the ore as it is wound are extremely up-to-date and almost entirely automatic. A full truck, on arriving at the pit head, is pushed out by a man on to an incline, down which it passes to a tippler. There the truck is emptied of its ore, which falls down a grizzley into a railway truck beneath—a branch of the Northeastern Line passes quite close to the mine; in fact, one walks along the rails from Brotton Station to the mine.

On leaving the tippler, the empty truck continues down an incline, and, passing automatic points, reaches a siding which is inclined upwards. At the end of the siding is a powerful spring, which serves to send the truck back again down the siding and past the automatic points. The truck now travels in the reverse direction and parallel to the way along which it came. After passing the points, the truck continues down a short incline until it meets a creep chain which takes it up on to a level, at the end of which it meets a stop. Three or four trucks may remain on this level until required.

On releasing the stop, the truck passes down an incline, past automatic points and past a catch, and travels some way up a second incline . On losing its momentum, it returns and is stopped by the catch, where it waits until required. The automatic points last mentioned are on the opposite side of the pit head to those previously mentioned, so that the truck is now going in the same direction as when it started and is returning to the cage. On releasing the catch, the truck passes down an incline and past points which are arranged to send it to the compartment of the shaft where the empty cage awaits it. The tippler has cog-wheels instead of friction wheels for turning, on account of the heavy weights, and it takes one truck at a time.

As the full truck (or "tub" as it is called locally) pushes the empty one out, the latter catches a lever which puts the tippler into gear. The tippler makes a revolution, and, in coming back to its place, puts itself out of gear again, while the truck just emptied remains in, ready to be pushed out by the next full one. The tippler is capable of dealing with 300 tons per hour.

The only manual labor required with this arrangement, beyond that involved in pulling levers to release catches, etc., is that of pushing the trucks out of the cage to start them on their journey.

Calcination.—Although gas-fired calciners using blast furnace gas are now being introduced, still by far the greater proportion of Cleveland ironstone is calcined in the Gjers or Cleveland kiln, or in modifications thereof. It is a matter of regret that drawings of some modern form of Cleveland kiln have not yet found their way into metallurgical text-books. The old form, discharging on to the ground, continues to be reproduced, together with the earliest type of Whitwell stove, as representative of British ironworks practice. Kilns of this description may still be seen in some of the older works. In one case, not only this early type of kiln, but also U-pipe stoves are to be seen, although it should be added that the works in question have the reputation of turning out some of the best pig iron in Cleveland.

The forms of kiln and the method of work at the Clarence Ironworks, Middlesbro', may be taken as typical examples of modern practice. In this works there are two distinct sets of blast furnaces, kilns, engine houses, etc., known respectively as the Old and New Sides.

On the Old Side the kilns are 16 in number, 15 of them being 37 feet high x 21 feet diameter, inside the lining, which is 18 inches thick. There is also one oval kiln 35 feet high x 35 feet, and 22 feet 6 inches diameter, lining 18 inches thick.

The round kilns have a capacity of 7,600 cubic feet. The gantry on the Old Side is supported by the outside shells of the kilns. The New Side kilns are higher. They are 14 in number, 12 being 21 feet diameter inside the lining (18 inches thick), and 44 feet high, and having a capacity of 10,400 cubic feet. One kiln is 19 feet 9 inches diameter inside the 18 inch lining x 43 feet 3 inches high, with 8,600 cubic feet capacity. This kiln is

drawn at one side only. There is also a rectangular kiln 20 feet 8 inches x 16 feet 10 1-2 inches x 44 feet, 18 inch lining, capacity 10,459 cubic feet.

The New Side kilns have the gantry supported by iron girder work, thus avoiding any strain on the kilns themselves. The burnt stone is drawn through 6 "eyes," or shoots, the lower ends of which are 3 feet 9 inches and 4 feet 6 inches above the ground level for the Old and New Sides respectively.

The cone in the Old Side kilns makes an angle of 55 degrees with the vertical centre line of the kiln.

On the New Side the cone is steeper, making an angle of 45 degrees, except in the case of 2 kilns which were altered to the old angle.

The varieties of ore calcined at the Clarence Works are obtained from the following mines, all owned by Messrs. Bell Bros.:

1. *Huntcliff.*—This ore contains much Fe_2O_3, which gives it its red color. It is also highly fossiliferous.

2. *Park Pit.*—Has the characteristic color of Cleveland ironstone, but is reddish in some parts. It contains much sulphur, both disseminated through the ore and occurring in black bands.

3. *Skeleton.*—Resembles Park Pit, but is somewhat paler. It contains sulphur and also considerable quantities of an oily shale, and weathers when exposed, the shale and sulphur bands breaking up and leaving the ironstone intact. Appreciably less fuel is required in the kiln when Lumpsey stone is calcined, owing to the oil which is present.

The coal used for calcination is obtained from pits in the neighborhood of Durham. After calcination the ore has lost 25—30 per cent. of its weight, and becomes a brick-red color owing to formation of Fe_2O_3. It is also softer.

The ore reaches the works in trains of 30 or more trucks, which are left on the sidings at the end of the gantry until required for tipping. The trucks used are hopper trucks known as "stripes," and hold 10 to 11 tons of ore.

The mode of working a shift at the kilns is as follows:—In the morning at six o'clock the kiln is about "six trucks down" (*i.e.*, it takes six trucks of stone to fill it), since it has been drawn continuously during the greater part of the night but not charged. The fire is well visible and should extend round the circumference and across the centre. The kilns are first coaled where required, the coaler only putting a shovel or two of coal in those places where the stone is "dead" or not fired properly.

Then four trucks of stone are tipped into each kiln, and the kilns again coaled, a thin layer of coal being shovelled all over the surface of the stone, just enough to cover it. Then two more trucks are tipped in each kiln and the kilns again coaled, more coal being put in those places that require it. This finishes the morning shift, and the evening shift is worked in a similar way. The shifts are from 6 a.m. to 2 p.m., or longer, for the morning, and from 4 p.m. to 12 midnight for the evening. The morning shift entails a greater amount of work, owing to the long interval between midnight and six o'clock, during which no charging has been done.

With regard to details of tipping the ore, the engine brings a small train of half a dozen or more trucks to the top end of the gantry and leaves them there. Owing to the incline of the gantry and the hand brakes on the trucks, the men can move the trucks and stop them over any kiln. In the bottom of the trucks are four drop doors held up by catches kept in place by pins.

When tipping, the pressure on the pins is released by a special iron implement and the pin withdrawn. Then the catch is forced back, and the ore drops through the doors into the kiln. More or less ore always remains in the ends of the truck, and this is dragged down by means of iron "hooks."

When the truck is cleared the drop doors are lifted up from the inside by inserting the end of the hook in a small hole, while a man outside replaces the pins. By releasing the brakes and removing the chock of wood from under the wheel, the truck is then readily pushed down the incline to make way for the next full one. Occasionally a truck of fine ore, known as "small stone," comes along for tipping. In this case half a truck is tipped into each kiln, two of the doors only being dropped.

In coaling, trucks of coal come on to the gantry only during the second coaling, *i.e.*, after tipping four trucks of stone into each kiln. Coal is then shovelled into the kilns by men standing in the trucks. The coal is in the form of slack. The men also make small heaps of coal on each side of the kiln and between the two sets of rails in the middle. It is from these heaps that the first and last coaling in the shift is done, the greater part of the coal consumed being shovelled on from the trucks during the middle coaling.

In drawing the kilns, two barrow loads at a time are drawn from each of the six eyes in rotation. Some of the kilns are oval or rectangular in plan, having three eyes together on each side. These are drawn in the same way, but the men prefer the round form to the oval for two reasons, viz.: They claim (1) that the round kilns work more regularly and use less coal, and (2) that they are easier to draw, as the eyes project and are not in a sort of recess. This enables the men to wheel their barrows straight up to them, and straight away again with a minimum amount of exertion.

The supply of ore and check on amount tipped are arranged for as follows: The gantry foreman sends an order each day for the ore he thinks he will require for his next shift to the office in Middlesbro,' whence it goes to the mines. At the mines the full trucks are weighed and the actual weight of ore is entered up in the invoice opposite the number of the truck. Each truck has spaces in which small cards can be slipped. These cards are printed with the number of the truck, the name of the mine, the name of Bell Bros., Clarence Works, etc., and space is provided for entering the weight of ore in the truck. The numbers are entered up in a book, so that the exact weight of ore tipped per shift is obtained. The same system is adopted for the coal.

With regard to the quantity of coal required for calcination, the amount given in text-books is usually 1 ton of coal for 20 to 25 tons of ore. The amount actually used in these works is 0.70 cwt. per ton of raw stone, or about 2 cwt. per ton of pig iron, which works out to 1 ton of coal for 21 to 29 tons of ore. This excellent result is possibly partly due to the oil shale which some of the ore contains, but may also be taken to be very largely due to good management of the kilns. It may be of interest to give a few brief notes on this subject.

1. *Practical Notes on Working the Cleveland Kiln.*—The stone should burn round the circumference and across the centre. As the stone is tipped into the middle of each semi-circle (looking at a plan of the kiln), this ensures that the burning takes place from outwards towards the centre. The fire may be kept in its proper place by judicious coaling.

2. The kiln should be drawn from each eye in rotation. If the men have not a smart foreman they will often draw continuously from the eye nearest the furnace hoist. This causes the fire to be drawn over to that side and is very liable to cause a scar, and also to cause "green" or unburned stone to come through the other eyes when they are drawn. One can see when the men have been drawing from one side only by noticing the line of fire, which should be across the centre of the kiln, is all on one side.

3. Too much small stone stops the draught and tends to cause scars. It is advisable that not much more than half a truck be tipped in each kiln per shift.

4. Scars are large masses of ore which have become fused together owing to excess of heat and are too large to be drawn through the eyes. They have to be broken up by prodding them with iron bars through the eyes. Large scars may give much trouble, first by sticking to the side and causing an irregular descent of material, with liability of green stone coming through, and, second, by stopping the working of the kiln altogether, in which case the fire has to be let out and the scar broken up from the inside. The chief causes of scars are (1) excessive or injudicious coaling, (2) irregular burning, caused by drawing from

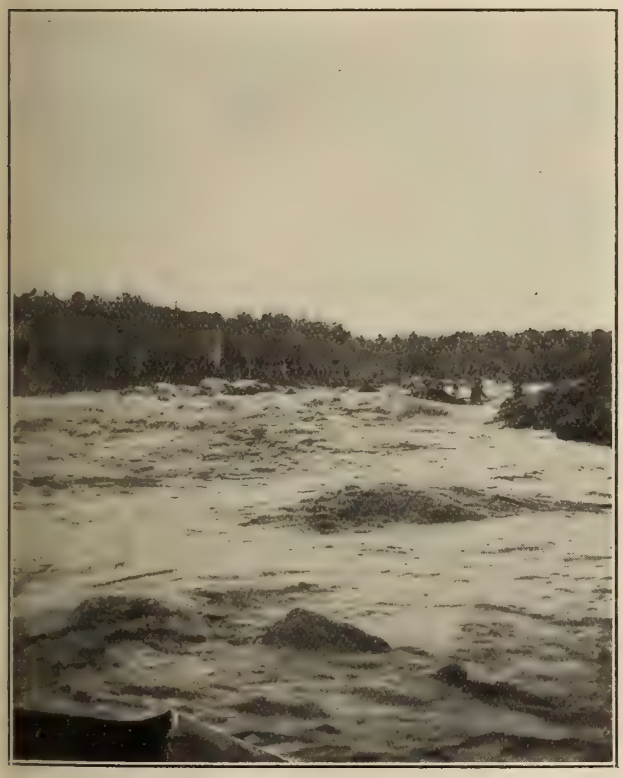
ne side only, or stoppage of draft by too much small stone, or ly the presence of a small scar on the side wall. The effect of regular burning is that green or unburned stone, together with s unburned coal, makes its way down one side of the kiln, and n reaching the bottom is fired from the other side, which is urning normally. This causes a sudden local increase of temerature, producing a scar.

5. In coaling the kilns, the "dirty" side (that towards which he wind is blowing) should be coaled first, so as to avoid the moke and fumes when coaling the other side.

6. A new-lined kiln takes appreciably less coal than one with any cavities in the lining.

7. The kilns should be drawn regularly and with fair frequency. This ensures the fire being well down towards the bottom and of a good depth. When the kiln is drawn at long intervals, the fire works its way upwards, getting very shallow and leaving a great depth of burnt stone below it. When this stone is drawn, the fire generally goes out or becomes improperly distributed.

8. More coal is required for the kilns in winter than in summer, on account of the moisture. The average amount works out at 12 tons extra per day per 24 kilns.



In conclusion, the author desires to express his appreciation of the ample facilities afforded by Messrs. Bell Bros., both to himself and other students of the Royal School of Mines, for obtaining at the Clarence Works a first-hand practical knowledge of blast furnace work. He is also greatly indebted to Mr. Greville Jones, of the Clarence Works, and Mr. D. W. Dixon, of the Lumpsey Mines, for their kindness in revising the proofs of this paper.

PROSPECTING IN UNGAVA

By J. C. Murray.

In the following article very free use has been made of Mr. A. P. Low's reports on the geology of the districts mentioned.

On June 1st, 1901, a party of nine white men and about twenty Indians embarked from Missanabie (a station on the C. P. R. 556 miles west of Ottawa) and started down the lake and river route for Moose Factory, Hudson Bay. On June 17th Moose Factory was reached. The journey had been somewhat trying. The writer was one of the crew of a large rowboat (18 feet over all),

RAPIDS ON MOOSE RIVER

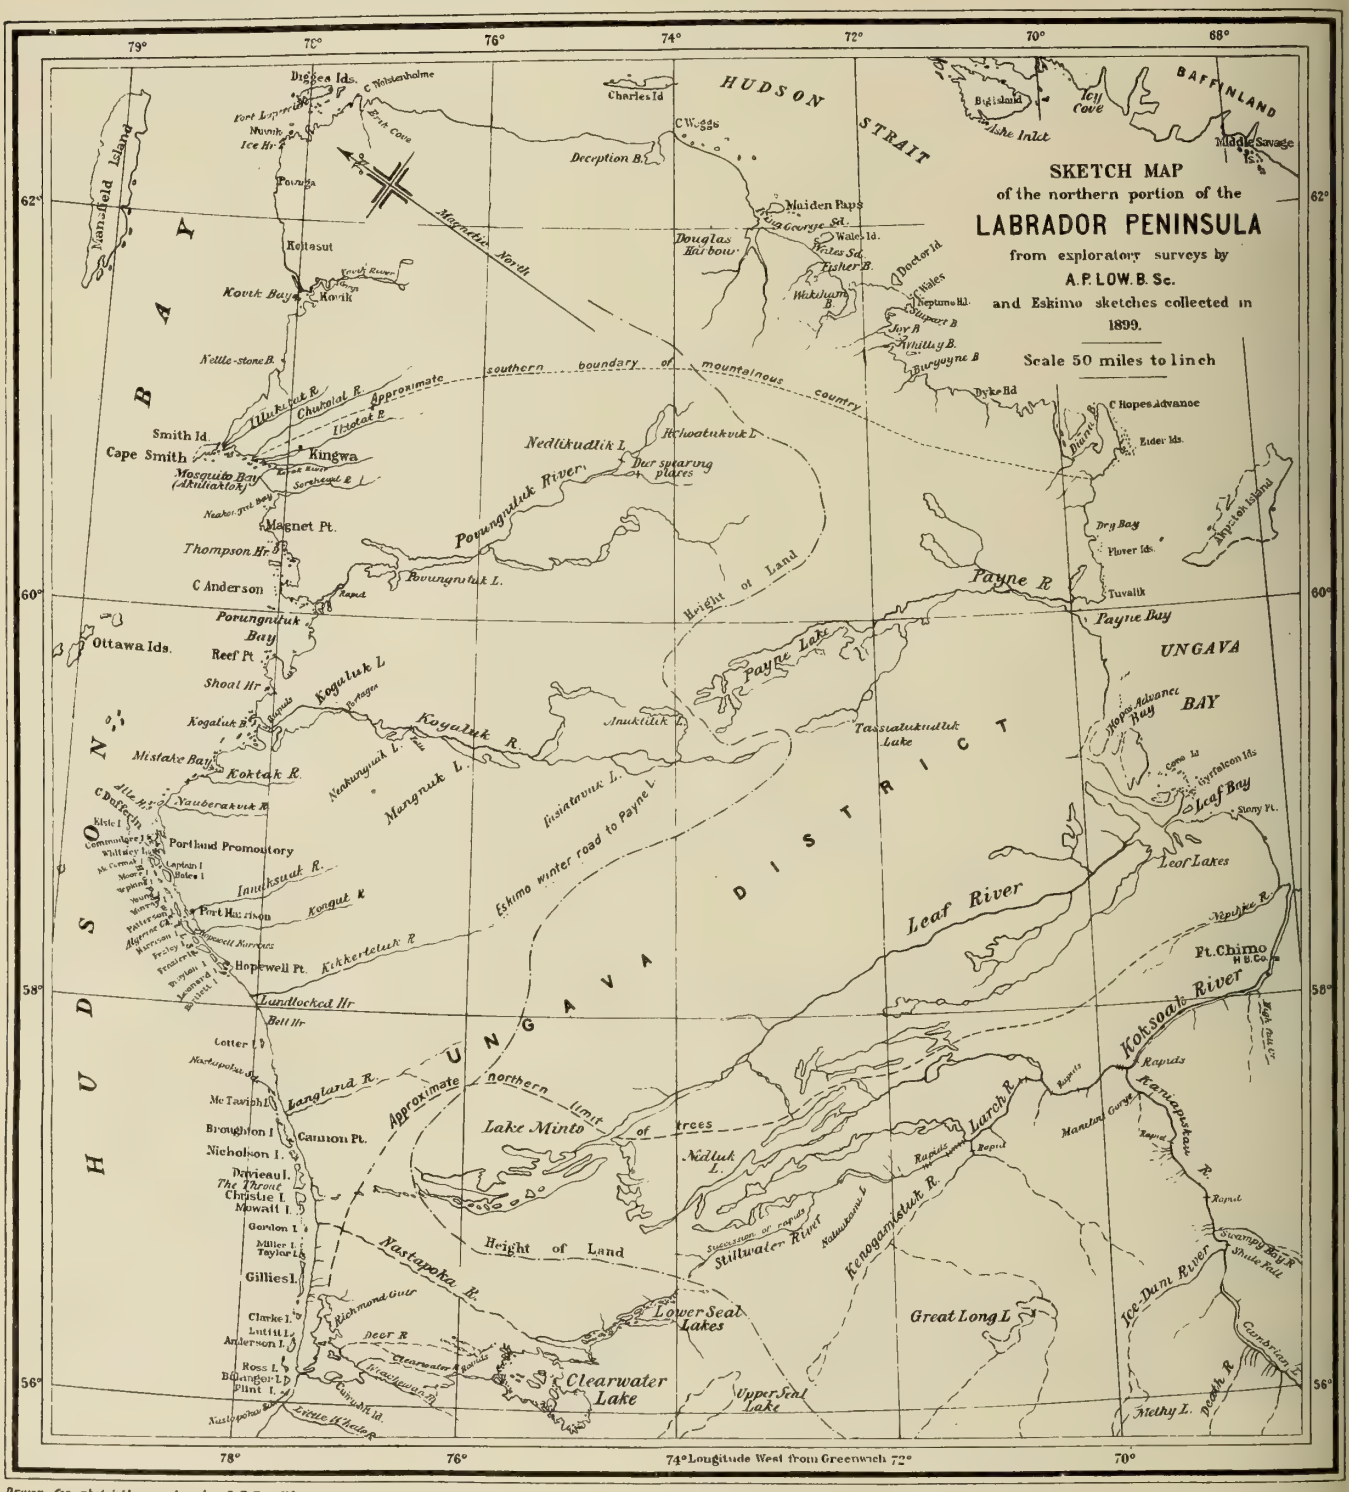
which had to be handled over portage and rapid and river for the long three hundred miles separating Moose Factory from Missanabie. Low water, piratical mosquitoes, malignant black flies, and lazy Indians, all did their best to contribute to our discomfort.

At Moose Factory the Indians were discharged. Four of the nine white men, headed by Mr. D. B. Dowling, of the Geological Survey of Canada, sailed up the west coast of James Bay for a summer's exploration. The remaining five, under the command of Mr. A. P. Low, who had been engaged by a private company to examine and locate mineral claims upon the Nastapoka Islands, left Moose Factory on the yawl-rigged 35-foot sailing yacht "Alle," on Monday, 24th June.

Touching at Charlton and Cape Hope Islands, we made Paint Hills Islands on June 29th. Heavy fog and a thunderstorm gave us a rather difficult run. Ice was encountered several times, and caused us much trouble. On Paint Hills Island a large deposit

NASTAPOKA FALLS

of iron pyrites was examined and staked out. Here also an Indian pilot was picked up, to guide us through the treacherous shoals lying between Paint Hills Bay and Fort George H. B. Post at the mouth of Big River. We made Fort George on July 2nd, in a full gale. The Fort is a consistent Hudson Bay Post, quaintly picturesque, with its stockades and Indian encampments grouped about the Factor's House. It is situated on an island at the mouth of Big River. It is of interest as marking the northerly



limit of land cultivation on the east coast of Hudson Bay. Potatoes and other vegetables are successfully grown here, and the Factor possesses a herd of cattle.

Cape Jones, the northern limit of the east shore of James Bay, loomed in sight on July 7th, and here we engaged three Eskimos, two of whom brought their families along with them. It was arranged that they should follow us in a sailing boat that had been chartered at Fort George.

Long Island was touched on July 9th. The Island is from one to three miles wide and about twenty-three miles long, and is distant from the mainland not more than five miles.

Low cliffs of limestone mark the east side. This Cambrian limestone, overlain by ferriginous cherty beds, which are in turn capped with trap, constitute most of the island. Much iron carbonate was observed here.

With a favorable breeze we logged 57 knots on July 9th, and reached Great Whale River, where is the most northerly Hudson Bay Post on this shore. A striking change was observable in the appearance of the country in this run. Low, rounded hills of gneiss and granite can be seen a short distance inland. The shore itself is generally low and sandy, and rises in terraces to the granite hills.

REPRODUCED FROM GEOLOGICAL SURVEY OF CANADA

Leaving Great Whale on July 11th, Little Whale River was reached during the evening of the same day. Thirty miles of this distance was made in Manitounuk Sound, between Manitounuk Islands and the mainland. Then, striking through a narrow channel between the islands, the remaining miles were run in the open.

Unaltered Cambrian sedimentary rocks, capped with diabase, form the coast from the northern extremity of Manitounuk

CLIFFS OF LIMESTONE AND SANDSTONE ON COTTER ISLAND

Sound northward to Little Whale River. This formation passes south into the Manitounuk Islands.

At Little Whale we found the ruins of an old Company Post. There are two well-defined trap overflows superimposed upon the sedimentary rocks here. The weathering of the under strata of sandstone and limestone has caused the fall of huge pieces of the basaltic trap. Galena, in small pockets, occurs throughout the limestone.

After a day's cruise, stress of weather and the loss of an anchor forced us into the entrance of Richmond Gulf. Almost exactly at this point the small scrub pines disappeared from the coast line, and beyond this no trees whatever were observed.

Iron ore occurs on the southern side of Richmond Gulf and continues north to the Nastapoka Islands.

We had now arrived at our real objective point, and systematic work was at once begun.

Commencing near the mouth of Little Whale River, the Nastapoka Islands extend northward for one hundred and twenty miles. They lie from one to three miles out from the mainland, and, with the exception of the most northerly, Cotter Island, are very close together.

The shoreward faces of the islands are precipitous cliffs, 100 to 350 feet in height, sloping with a dip of from 15 degrees to 35 degrees westward into the sea. Their general appearance roughly suggests an emergence of the edge of the basin which forms the bottom of Hudson Bay. The east shores afford safe anchorages for craft of all sizes; but on the mainland only at the mouths of Nastapoka and Langland Rivers can harbours be found.

The Islands are marked from summit to sea level with old terraces and beaches, evidences of profound uplifting towards the close of the glacial period.

In general, the Nastapoka Islands give a section in descending order, of the follow members:—

1. Rusty weathering, dark gray, siliceous rock containing ankerite and magnetite—20 to 100 feet.
2. Dark gray siliceous rock, containing magnetite with small quantities of ankerite—50 to 250 feet.
3. Red jaspilyte, rich in hematite ore—10 to 100 feet.
4. Red jaspilyte, poor in hematite ore—5 to 20 feet.
5. Purple, or greenish weathering, dark green, graywacké shales—10 to 70 feet.
6. Red jaspilyte, poor in hematite ore—5 feet.
7. Light greenish gray sandstone and shale—10 to 300 feet.
8. Fine grained dolomite—50 feet.

The rocks of the first division are found on all the islands except Cotter, the most northerly. These occur in thin beds, the partings being filled with brownish ankerite, which also occurs in flat lenticular masses enclosed in the cherts. These measures are traceable 150 miles south to Long Island.

The typical rock of the second measure is a dark gray, fine-grained variety of quartzite chert, containing considerable magnetite scattered through it in minute crystals, and small quantities of siderite and ankerite. The mixture of silica and magnetite in the ore is intimate, the silica being usually in a finely divided state. The proportions of rock vary. In some places a lean ferruginous chert is found, and in others a rich sixty per cent. iron ore. In the lower beds, large quantities of the richer ores are found. Similar occurrences in the Lake Superior region have been prescribed by Prof. Van Hise.

On the three southern islands, these measures gradually pass into a brownish-black siliceous shale, rich in iron, and containing considerable carbon and small flakes of graphite.

The typical rock of the third division is fine-grained and very siliceous, with minute particles of silica coated with red oxide of iron, forming a coarse, impure red jasper.

These jasper rocks usually occur in thin broken bands, with the partings between them filled with a finely-divided mixture of hematite, magnetite and jasper. The hematite is greatly in excess of the magnetite. The intimate association of the iron ores and the jasper points to their simultaneous deposition from aqueous solutions, probably leached from the cherty carbonate measures above. Where the ore is poor, the jaspery rock predominates and incloses lenses of hematite, while where the hematite is most plentiful it incloses similar lenses of jasper.

The fourth division, consisting of red jsapilytes, is an arbitrary one, of use only as a sub-division of the iron-bearing rocks.

The rocks of the fifth division differ from those of the rest of the section in that they are of volcanic origin.

GILLIES ISLAND—UPPER IRON BEDS

The dolomites forming the eighth and lowest division are only met with at the eastern point of Belanger Island, the last but one to the extreme south.

From a study made of the southern cliffs of Richmond Gulf, in 1988, by Mr. Low, it is inferred that the Nastapoka group of rocks, with their important iron-bearing measures, belong to the middle portion of the so-called Cambrian formation of the Peninsula of Labrador. Consequently, they are older than the rocks of the coast and underlie them.

Large areas of similar unaltered sedimentary rocks occur throughout the Peninsula of Labrador, and are probably the

equivalents of certain of the iron-bearing series about Lake Superior and of those to the westward of Hudson Bay.

The southerly islands of the Nastapoka group are richer in iron ore than those towards the north. In Gillies Island (see map), the iron-bearing measures constitute at least four-fifths of its rock areas. At Taylor Island the iron-bearing rocks attain a maximum thickness of nearly 200 feet.

Towards the northern end of Davieau Island the dark gray cherts become thicker, especially in the upper rusty portion carrying ankerite, while the underlying jaspilyte contains less hematite and gradually thins out. The total amount of ore appears to be smaller and to be more evenly disseminated than in the southerly island, so that no part is rich enough for mining.

On the mainland, almost opposite Gordon Island, are the Falls of Nastapoka River. From a photograph only a very meagre idea can be obtained of their splendor. A high perpendicular wall of rock on the north side, and broken, massy crags on the other, form the banks of the river. At the falls the river leaps

WEATHERING EFFECT, NASTAPOKA ISLANDS

splendidly out and drops a sheer 100 feet. The water is shaken into the whitest foam ,but, as a contrast, pure deep green bands of unbroken water are visible behind the white of the foam. The stream then drops farther, down a constricted channel of solid rock, to tide-water. In all, there is a drop of about 170 feet. Almost incalculable power has been wasting itself here for ages.

Langland River, also, has not inconsiderable falls near its mouth. They are not, however, at all to be compared with Nastapoka. At both places, and at Nastapoka particularly, an enormous aggregate of industrial power could be developed.

There is little doubt that in due course of time, when concentrating and smelting methods shall have been improved, the iron deposits on many of these islands will be amenable to reduction upon a commercial scale.

(To be continued.)

Muscovite, the most common of the micas, is named from Muscovy, a part of Eastern Russia. The occurrence of this mica is confined, more or less, to pegmatite dikes, masses, lenses, sheets or veins, which in chaarcter may be called a very coarse granite.

COAL SAMPLING

(Paper read by Dr. J. E. Woodman before the Nova Scotia Mining Society.)

Recent plans of the Director of the Geological Survey of Canada lend especial interest to discussion upon two subjects—namely, the classification of coals and the relative efficiency of various methods of sampling coal.

A few years ago the United States Geological Survey began to carry out a plan for testing coal on small and large scales, and in every way which might be useful for the consumer and the investor. For this purpose they erected at St. Louis, Missouri, a testing plant in which these results might be reached; and, although the plant has been in operation but a short time, certain data have been gathered which give a fair indication of certain qualities to which we have been paying a little attention.

It is understood that Mr. A. P. Low, Director of the Geological Survey of Canada, is planning for a similar series of test investigations in connection with the Laboratories of McGill University. It is intended that the sampling of the coal shall be done by specially designated members of the Survey staff, who will cover the various collieries from the Eastern to the Western extremities of the continent. In addition to the ordinary chemical laboratory analyses and tests, it is intended to subject the coals to practical tests under boilers, and in every other way which will give valuable information regarding all of their fuel properties. The results will be printed in leaflet form as fast as obtained, and distributed quickly to those most interested in that particular coal. These will later be collected into pamphlets, and probably at the end a larger monograph will result. It is important to note that not only is a new departure being made in the type of work done by the Survey, but also in the rapidity with which the results bid fair to reach the public. The distribution of the summary report for 1906 within less than a month after the close of the year is an earnest of what is to come later.

It is an important question, under what conditions coal sampling can be done so as to give results most directly applicable for commercial purposes. I take it for granted that the chief value of sampling and analysing any economic raw material is the discovery of its commercial properties. For surely no merely academic interest would be responsible for the large amount of analytical work that has been done upon various substances. The sources of the material in coal sampling may be quite varied. In the first place, on may sample the coal in process of shipment, secondly, one may sample the coal at point of delivery, or thirdly, the coal may be sampled at the point of consumption, which is nearly the same. As contrasted with these localities, there are the mines and their surroundings. Should the coal be sampled underground, in the seam, or on the rakes or lifts at the bank head, or periodically at the storage piles; or should all of these localities be used in order to check one another? For metallurgical purposes, it seems clear that whatever sampling is done at the mine, there should be careful sampling at the point of discharge of the coal; since it is probable that only a part of the coal mined at any particular colliery will reach a certain metallurgical establishment, and, moreover, it is perfectly conceivable that the coal which is used at such establishment may not always have the same source. Thus we have the two facts to consider, namely, variability in the mine and variability of source of shipment. The present paper aims only to show the results of work done in connection with the United States Geological Survey testing plants at St. Louis, in order to see whether we may get some light upon possible methods to be used later in this country. It makes no claim to originality in any way, being essentially a resume of what has been published on the subject by the United States Geological Survey, and in the Am. Inst. Min., Eng.

In the St. Louis plant, coal was received for testing only in car load lots, and the cars were loaded under the immediate supervision of a member of the Government. As a check upon these results, two mine samples were collected from each colliery;

and these samples, as well as samples taken from each car when received at the testing plant, were analyzed in the chemical laboratory. The dominant idea throughout was that the mine sampling should be so done that the coal should have the same composition as the commercial output of the mine. Before sampling, the mine was examined, and all its peculiarities, or rather the peculiarities of the seam and surrounding rocks, carefully noted. Methods of mining were observed, and note was taken of whatever efforts were made commercially in the mine or at the bank head to free the coal from impurities. Two points were then selected for sampling in widely different parts of the mine, but always in parts then in process of excavation and shipment. After cleaning the floor, an oilcloth blanket was spread to catch the coal, to prevent it from being mixed with dirt, and to avoid absorption of moisture where the floor was wet. A cut was made clear across the face of the coal, about three inches wide and one inch deep. The material from this cut would include the thin partings of shale, clay, or sulphur, such as the loaders would not separate from the coal; but would not include anything that is usually thrown out by the miners. Such a sample, weighing 25 or 30 pounds, was placed in a sack and taken to the Survey, there to be pulverized and quartered. The final result would be about one quart of fine coal. This was placed in a screw top iron sampling case, the cover of which was bound with electric tape. These were mailed directly from the colliery to the laboratory, and the sample was then transferred to a glass jar and sealed.

After securing the sample underground, the inspector went to the surface to observe the loading of a test car. In this loading, such hand picking was allowed as was usually done in preparing coal for the market, and every care was taken to make the car a representative commercial sample. In the case of very soft coals and lignites, such as we have in abundance in our Western Provinces, box cars were used for transportation, in order to keep the coal from disintegrating in transit. Ordinarily, however, the bituminous as well as the anthracite coal was shipped in the usual open cars. As far as possible the shipping was done during the pleasanter seasons of the year. Thus all possible ordinary precautions have been taken to prevent a great change in the moisture contents of the coal between the pit bottom and the testing plant.

Upon arrival, the coal was unloaded and passed at once through rolls which had apertures of 1.5 inches. As the coal was fed to the rolls, samples were taken at regular intervals with a small shovel. Thus a practically continuous sample aggregating 200 or 300 pounds would be obtained from each car. This was taken directly to the chemical laboratory and analyzed. In the laboratory all samples were divided, and part stored in sealed glass jars for future reference. The remainder was subjected to practical analysis. The sample was air dried until it reached a practically constant weight and the loss of moisture was determined. The sample was then analyzed, and its composition was recalculated on the basis of the coal as it was originally received. The two mine samples were always averaged; and the percentages of moisture, sulphur and ash are considered as representing practically the impurities obtained in as careful mine sampling as could be devised. The car samples were also averaged; and the result is regarded as giving the amount of impurities obtained in the commercial conduct of the mine.

Results of these samples, which were taken from fifty mines in fourteen States. are as follows:—

Moisture: (1) Lignite and lignitic coals show higher moisture in the car samples than in the mine samples, but the difference is slight.

(2) Bituminous coals having more than 5 per cent, of moisture usually show less in the car samples than in the mine samples, the loss being about 1.5 per cent.

(3) Bituminous and semi-bituminous coals with less than 5 per cent. moisture usually show a gain in the car sample to the extent of 1.5 per cent.

So few tests were made upon anthracites that they are neglected here.

Sulphur.—The variation between the mine and the car samples is slight. The general average shows an increase in the car samples. This is probably due to more rigid exclusion of impurities in selecting the mine samples than miners ordinarily use in loading commercial coal. The amount of increase is .04, taking into account all the samples made. Hence, at least in the United States, it is probable that in mine sampling it is necessary to multiply the amount of sulphur by 1.04, in order to obtain the actual proportion of sulphur in the working output of the amount. When the percentage of sulphur is small, this increase may be disregarded; but when it is large, as in so many Nova Scotian coals, it becomes an important feature.

Ash.—The greatest and most constant variation is in the ash. Of the 50 analysis, 46 showed a larger percentage and four a smaller percentage in the car sample than in the mine sample. The evidence, then, is overwhelming that in commercial practise more impurity is left in the coal than in any ordinary sampling, or, to put it in other words, that sampling is done so carefully as really to misrepresent the commercial value of the coal. Some of the cars were loaded from run-of-mine coal and others with lump coal, and it was thought at first that this might be responsible for the increase in the percentage of ash. Careful tests, however, showed that this was not the cause. Naturally, also, a certain personal element enters into the question of this class of sampling as into any other; but it appears that, although the percentage of cases of ash obtained by each inspector was different, nevertheless in practically all cases there was an excess in the car sample.

The result of all these tests appeared to show that it is not usual for mine samples to correspond with the commercial output of the mine, and, furthermore, it showed that the personal element must be still further reduced to secure satisfaction. If one man were to do all the sampling, the relative values in the different cars would be correct; but this is practically never possible upon a large scale.

Proposed Method of Mine Sampling.

Quoted, with the exception of geographical references, from Campbell, M. R. Trans. A. I. M. E., XXXVI., 352-353.

1. Select a fresh face of coal, and clean it of all powder stains and other impurities.

2. Cut a channel perpendicularly across the face of the coal from roof to floor, with the exceptions noted in 3, of such a size as to yield at 5 lbs. of coal per foot of thickness of coal bed; that is, 5 lbs. coal for a bed 1 foot thick, 10 lbs. for a bed 2 feet thick, 20 lbs. for a bed 4 feet thick, etc.

3. All material encountered in such a cut should be included in the sample, except partings or binders of more than 0.25 in thickness, and except all lenses or concretions of sulphur or other impurities greater than 2 inches in maximum diameter and 0.5 inches in thickness.

4. The sample may be sent to the laboratory as it is cut, or it may at once be quartered down to about the size of a quart. If it is quartered down, it should be divided into quarters and opposite quarters rejected. The operation of mixing and quartering should be repeated until the desired size of sample is obtained. The operation of pulverizing and quartering should be done as rapidly as possible, so as to prevent a serious change in the moisture content, and then the sample should be sealed in either a glass jar or screw top can, bound with wire tape, and sent to the laboratory for analysis.

5. The analysis of such a sample will show the grade of coal that may be obtained by careful mining and picking. In the majority of cases the sulphur and ash in the commercial output of the mine will exceed the amount obtained from the sample, but this can be approximated by multiplying by certain coefficients. The co-efficients determined in the work of the Geological Survey coal-testing plant last year will not be strictly applic-

able, since the sampling was not done under this system; but they are approximately the same and can be used until more accurate co-efficients are determined. When sufficient data are at hand it seems possible that specific co-efficients may be determined for certain fields; that is, a co-efficient for the Sydney field, another co-efficient for the Western Cape Breton field, etc., and finally, co-efficients may be determined for local sub-divisions of the larger fields, or for certain beds of coal within those fields.

6. All descriptions of samples should state definitely how the samples were obtained, so that the reader may judge for himself the value of the results obtained; and when analyses are recalculated, the co-efficients of increase or decrease should be given, together with the authority for using this co-efficient or the data upon which it was determined.

Mine Pumping with Direct Connected Electrically Driven Turbine Pumps

By P. H. Moore, M.E.

(Paper read before the Nova Scotia Mining Society.)

Introduction.

Few problems in hydraulics present more interesting possibilities, and at the same time have been more universally neglected, than centrifual pumping.

The development of the centrifugal pump has been analogous to that of the steam turbine, and, although both were pioneers in their respective fields, both were almost entirely abandoned in favor of the reciprocating engine before having been exploited, the centrifugal pump because the principles of its action were not thoroughly understood, and the steam turbine engine because of mechanical difficulties in its construction.

As turbine pumping has been until the last few years absolutely unproven as regards practicability in mine pumping, my experiences with turbines in the Micmac Mines, Leipsigate district, Nova Scotia, may be of some practical service to engineers present.

Description.

The motor driven turbine pump is the exact converse of the waterwheel generator set, that is, instead of the turbine driving the generator, the motor drives the turbine. Both motor and turbine are set upon the same base, and are set as close together as the shaft coupling will permit. This makes a very compact and convenient outfit. In lowering such a pump into the mine, it is only necessary to disconnect the coupling, remove the motor and turbine from the base, and lower the pump in three pieces into the mine.

The only moving part of a single stage turbine pump is the hollow disc, or impeller, which is made of composition or cast iron, and is enclosed in an air-tight pump casing. This impeller has an opening at its axis for the suction, and numerous openings in its circumference for its discharge. Inside the hollow disc, or impeller, are a series of curved spokes or vanes, which serve as partitions between the openings in the circumference. These vanes are placed in the same manner that guide veins are placed in a reaction turbine waterwheel, and are curved so as to form tangential expanding ducts, from which the water emerges at about the velocity existing in the discharge chamber of the pump. The water enters the impeller axially, and issues radially.

Without going into further details as to the numerous designs employed in turbine pumps, I may say that modern ingenuity has so designed high head turbines that there is practically no drag or friction between the periphery of the rapidly revolving impeller and the water in the discharge chamber.

Principle Involved.

The principle of centrifugal force is employed the same in high head turbines as it is in the old-fashioned, low head centrifugal pump, although the mechanical construction is improved to suit the work for which it is built.

A single stage turbine may be designed in such shape and driven in such speed that it may pump against a head of from 50 to 150 feet, with wide variations. Wherever it has been necessary to pump against extremely high heads, the practice until the past few years has been to have the discharge of one turbine led by a pipe directly into the suction of another, and so on, thus multiplying the lifting capacity by multiplying the pumps until the required head was reached. The modern practice, however, has taken advantage of the convenient size and shape of the turbine in a very economical manner. The multi-stage turbine of to-day has a series of impellers mounted upon the same shaft, and all enclosed in the same case, and are arranged in such a way that the speed of the water may be multiplied in proportion to the number of impellers used. The capacity of such a pump is only limited by the number of impellers, and the amount of power necessary to drive them.

Such a pump is to-day pumping water against heads as high as 2,000 feet, and doing it with remarkable economy.

Micmac Pumps.

In the Micmac Mine we have a three-stage, three-inch turbine station pump, with a capacity of 230 gallons per minute against a 300 foot head, driven by a 30 horse-power direct current motor; and a three-stage, two-inch vertical turbine sinking pump of 100 gallons per minute capacity against a 250 foot head, driven by a 10 horse-power direct current motor.

The speed of both the above pumps is controlled by a variable speed resistance coil. The ordinary speed of both pumps is about 1,150 revolutions per minute. The station pump has a three inch discharge pipe and a three inch suction.

Starting the Pump.

There are some peculiar features about starting and running a turbine pump that may be of interest to such of you as have had your troubles with pumps of other descriptions. To start our turbine pump, we first drain all the water out of the discharge pipe through a bipass, leaving the pump and suction full of water. We have a gate valve in our discharge pipe close to the pump. This we close as soon as the pump is primed. We then start our motor with an auto release starter, and get it running up to full speed, still keeping the gate valve in the discharge pipe tightly closed. When the motor is up to speed, we gradually open the discharge pipe until the gate valve is wide open. By that time the pump is throwing at its full capacity. You all know what would happen if we undertook to close the gate valve in a discharge pipe on an ordinary steam or jack head pump while the pump is running, or started the pump with such valve closed when the pump was full of water. At any time while the turbine pump is running we can close the gate valve in the discharge pipe, or the gate valve in the suction, or both, and do the pump no harm in any way. After running a few minutes with the discharge closed, the water in the pump gets hot. I never experimented to see just how hot the water would get if left running any length of time, as it might be an expensive experiment.

The amount of water that a turbine pump throws can be controlled either by the gate valve in the discharge pipe or the gate valve in the suction. The pump will only take power proportionately to the amount of water it is throwing, which is a great convenience in mine pumping.

In case the current is cut off on deck, the auto release starter flies back and the power is automatically shut off from the pump, and it cannot be started again except by the proper manipulation of the auto release starter. This auto release starter pre-

cludes any possibility of the motor being started under full current from the deck.

I wish to particularly call the attention of pump men present to the fact that the Micmac pump is pumping 230 gallons of water per minute against a 300 foot head, through a three inch pipe. There is not another style of pump in existence that will throw that amount of water through so small a pipe and work at anywhere near its economic efficiency.

This turbine takes up about one-third the room of a reciprocating pump of equal capacity, and the cost, including the motor for driving, is only about one-half. The pump runs with practically no noise, the low hum of the motor being hardly noticed. There is no vibration in the discharge pipe, and the flow of water is perfectly steady, there being no throbbing or pulsations in the stream discharged, the water being driven through the pipe at a tremendous speed.

The turbine sinking pump is started in exactly the same way as the station pump. A description of this turbine pump may be interesting. Where the station pump is set upon a horizontal base, and the pump and motor run upon a horizontal axis, the turbine sinker is arranged to run vertically, the motor above the turbine. This vertical sinking pump is arranged in a cast iron water-tight housing, so that in case the shaft fills up with water the pump will run submerged as well as it will out of water. There is a pipe connection in this cast iron housing that a small air pipe may be connected, if necessary, to facilitate the introduction of compressed air into the jacket, and thus keep out all moisture that may accumulate from the sweating of the cast iron while the pump is under water. We have never had our turbine pump submerged long enough to make it necessary to use compressed air. With compressed air the pump may be used submerged for long periods of time.

The only objection to a direct current motor in a sub-aquatic pump of this description is that we are obliged to attend to the brushes and commutator through hand holes cut in the cast iron casing. An induction motor with an alternating current makes a better outfit, and this is the current we are preparing to use in our new electrical installation.

Our sinking pump is throwing 100 gallons of water per minute against a 250 foot head through a two inch pipe. The suction is of the same size as the discharge pipe, owing to the fact that the water is picked up at the same speed that it is thrown out.

Method of Using the Turbine Sinker.

The convenient size and shape, and lack of moving parts make the turbine sinker ideal as a sinking pump. Our sinking pump is hung by chains from differential pulley blocks in any position in the shaft that may be convenient. All pump men know that in using a steam sinker it is necessary to get the pump in such a position that you can connect at least two lines of pipe to it, and sometimes three when the exhaust is carried to the deck, or to some other part of the mine. With a turbine sinker, you have only one line of pipe to connect to your pump.

In order to make our sinking pump more flexible, we use an ordinary rubber fire hose, one end of which is connected to the discharge of the pump, and the other end to the discharge pipe. This gives the pump a chance to be left in any position convenient, and the pump may be lowered without stopping it and without losing its water, and no care need be taken that it is in any particular position. In pumping out a shaft, this style of pump is invaluable, as there is no time lost in pumping while lowering the pump. Owing to its sub-aquatic qualities, we can lower it as far down into the water as the length of the discharge hose will permit. There being no vibration to the pump, a discharge hose will last as long as an iron pipe.

The only objection we have ever found in using our turbine pump, is that in case the turbine loses its water owing to the necessity of moving the discharge hose while the men are working in the bottom, it is necessary to drain the discharge pipe before starting the pump and getting it to take its water again. We have found that gritty water, and any gravel that it large enough to go through the strainer of the suction hose, is handled without injury to the pump.

The small flexible cable that is necessary to carry the current to the pump is covered with a waterproof covering, and has given us no trouble whatsoever.

The auto release starter and variable speed coil are kept in a wooden box at any distance above the pump that is convenient.

Owing to the remarkable fact of having perfect control, by means of the gate valve in the suction or discharge, of the amount of water pumped, the men sinking very learned to adjust the discharge of the pump to the amount of water that the shaft was making, and consequently we have had but little trouble with the sinking pump losing its water.

In case of unexpected springs of water being encountered, the variable speed resistance coil makes it possible to turn the motor up several hundred revolutions per minute above its ordinary speed, so that for some hours a turbine is capable of pumping at least a third over its rated capacity without injury to the motor.

Turbines Compared with Steam and Jack Head Pumps.

We have been running the two turbine pumps mentioned for over a year, and have generated our power to run them in our own shaft house, by driving a 35 killowatt generator with a 75 horse-power engine. We have run a certain number of steam pumps all the time during this year, and have had a splendid chance to compare steam and air pumping with electric turbine pumping.

Where the theoretical power required for a steam pump is about one-third of that actually required by an electrical turbine pump, the enormous losses in steam power through condensation and leaks, the friction in the pump, the numerous delays from breakdowns, the innumerable expenses of packing, oil and attendance, with the nuisances caused by noise and exhaust, more than balance the theoretical power saving in using steam reciprocating pumps over steam generated electrical power for running turbine pumps.

Undoubtedly the old jack head pump run by a Corliss engine is very economical, so far as power is concerned, in mines that have fairly straight shafts, and are not at any great depth, and where there is only a small amount of water to pump, but in deep mines, with large amounts of water to be considered, with more or less irregularity in the dip of the shaft, and where economy in space is to be considered, the turbine pump has proved to be as far ahead of the old jack head pump as the jack head pump is ahead of carrying water in a bucket.

A reciprocating steam pump has innumerable parts that have to be removed and constantly attended. The expenses for packing, and oil, for machines of this description is enormous, compared with turbines. The numerous lines of pipe need continual attendance, and most careful installation; the frictional losses are enormous; the wear and tear of a steam pump in a mine is heart-breaking; the noise is a nuisance; the room it takes up is inconvenient, and the first cost is nearly twice that of a turbine.

In a motor driven turbine there are no valves to pack, no guards or springs, no reciprocating parts, and, most important of all, there is not a contact surface in the entire machine except the shaft and its bearings. The design is such that parts subjected to the action of mine water may be made of acid-resisting metal, and when desired lead-lined pumps can be obtained. The space occupied is less than one-third of that of a reciprocating pump of that capacity. The discharge pipe is much smaller, and there is only one line of pipe. Since there are no rubbing surfaces exposed to the water, the pump will run for years without renewal or repairs, and it will pump anything from thick mud to the cleanest water without injury. In case of accident, the parts are so few, and the construction so simple, that any parts of the machine can be replaced in less than an hour. The cost of attendance is reduced to the minimum, since the only necessary attendance is to see that the pumps and motor are properly lubricated.

Our turbine pump uses about one pint of motor oil in sixty days. All the bearings work in oil, and there is no drip and no waste. The oil is literally worn out.

CONCLUSION.

Our turbine pump in the Micmac Mine has cost just $2.64 for new brushes in the thirteen months that it has been running incessantly. This is the only renewal that has been made on the pump.

With this experience to base my opinion on, I may say that I am convinced that even with steam generated electrical power, a motor driven turbine pump will pump more dirty, gritty water against a high head with less expense per gallon pumped than any other pump ever before invented.

MINERAL PRODUCTION OF BRITISH COLUMBIA

The following information concerning mineral production of British Columbia was given by Mr. E. Jacobs, editor of "The British Columbia Mining Record," in the course of his remarks on this subject at the recenty-held annual meeting of the Canadian Mining Institute:—

British Columbia's total mineral production to the end of 1905 is shown in official publications to have been in value nearly $249,000,000. Adding that for 1906, estimated at rather more than $26,000,000, a grand total to the end of 1906 of, approximately, $275,000,000 is obtained. This production was apportioned in round figures as follows:—

Placer gold—		
Lode metals		$ 58,700,000
Gold	$41,500,000	
Silver	25,900,000	
Lead	17,700,000	
Copper	36,000,000	
Iron and zinc	200,000	
		121,300,000
Total metalliferous		$191,000,000
Coal and Coke—		
Coal	$73,000,000	
Coke	6,500,000	
	$79,500,000	
Building materials, etc.	5,500,000	
Total non-metalliferous		85,000,000
Grand total		$275,000,000

Reviewing several periods, its is seen that from the commencement of mining operations in the Province to the end of 1886, the total value of production was $64,246,000, in the following proportions: Placer gold, $53,797,000; coal, $10,449,000. In the ten years, 1887-1896, a total of $37,809,000 was produced, consisting of placer gold, $5,006,000; lode metals, $8,126,000, coal and coke, $23,537,000, and buildings materials, etc., $1,140,000. For the ten years, 1897-1906, the total was $173,000,000, comprising placer gold, $9,889,000; lode metals, $113,299,000; coal and coke, $45,441,000, and building materials, etc., $4,371,000.

Recapitulating, the production of the respective periods above mentioned was as follows:—

To end of 1886	$ 64,246,000
Ten years, 1887-1896	37,809,000
Ten years, 1897-1906	176,000,000
Total production, all years	$275,000,000

The progress of British Columbia's mining industry is further indicated in the following summary:—

COAL AND COKE.

Coal mining appears to have been commenced in 1836, but production must have been small during 30 years to 1865, inclusive, official records showing a total value for the whole of that period of only $666,288. It was not until 1884 that the total for any single year reached $1,000,000, the recorded value for that year having been $1,182,210. As already shown, the total value to the end of 1886 was $10,449,000. During the next period, 1887-1906, the production of $23,537,000 included $7,825 for coke, the manufacture of which was commenced at Union, Vancouver Island, in 1895. Of the total of $45,441,000 for coal and coke during the period 1897-1906, the production of the latter was $6,565,000, chiefly from the collieries of the Crow's Nest Pass Coal Company, at which coke-making was begun in 1898.

PLACER GOLD.

The production of placer gold dates back to 1858, in which year a total value of $705,000 was recovered. The maximum production in any one year was that of 1863, with a value of $3,914,000, followed the next year by a total of $3,736,000. This was when placer mining was at its best in the Cariboo district. In the seventies there was a gradual reduction, while through the eighties the decrease was more marked ,continuing into the early nineties. The minimum yearly total was reached in 1893, the production for that year having been only $356,000. Thenceforward there was a steady increase. The yearly average total recovery during ten years, 1897-1906, was about $988,900. The total production during 49 years has been in round figures:—

In nine years, 1858-1866	$23,675,000
In ten years, 1867-1876	19,790,000
In ten years, 1877-1886	10,340,000
In ten years, 1887-1896	5,006,000
In ten years, 1897-1906	9,889,000
Total	$68,700,000

LODE METALS.

The tables of production of lode mines, published in the "Annual Report of the Minister of Mines for British Columbia," show that a commencement was made in 1887, in which year silver and lead to a total value of $26,500 was produced. The first official record of lode gold was a value of $23,400 for the year 1893, and of copper $16,200 for 1894.

Gold.—Out of a total of about $41,500,000 of lode gold, not quite $2,200,000 was produced during four years, 1893-1896, and yearly production during five years, 1902-1906, has been $4,878,000. In 1906 a total exceeding $5,000,000 was reached, and it is expected that henceforward there will be an annual increase over that amount.

Silver.—Production of silver during ten years, 1887-1896, totalled $4,028,000, of which $2,100,000 was produced in 1896. The yearly average value during the ten years, 1896-906, was $2,187,200, with a maximum of $3,273,000 in 1897 and a minimum of $1,521,000 in 1903.

Lead.—The production of lead was small during the period 1887-1896, having totalled only $1,581,101. During the following ten years an average yearly output of $1,556,706 was maintained, with a maximum value of $2,691,887 in 1900, and a minimum of $689,744 in 1903.

Copper.—No copper was produced until 1894, in which year a beginning was made, with an ouput valued at $16,234. For the three years 1894-6, a total of $254,802 is recorded. Thereafter the average yearly production for ten years was $3,569,321. The output of 1906, estimated at $8,690,000, was by for the highest for any year since production was begun.

PRODUCTION OF 1906.

Turning now to the production of 1906, which was a record year in the history of mining in British Columbia, it is especially noteworthy that this single year's production, estimated at $26,390,000, was not very far short of one-tenth of the total for all years to date (one-tenth would be $27,500,000). While the high prices of silver, lead and copper contributed in large measure to the considerable increase in value of the year's production over that of any other year, there was also an enlarged output of lode gold, silver, copper, coal, and building materials. Copper especially made a substantial gain in quantity—about 7,300,000 lbs. more than was prdouced in 1905. Coal also showed an appreciably large increase over the production of 1905, while the output, estimated at 1,530,000 tons, was the biggest tonnage reached in any single year.

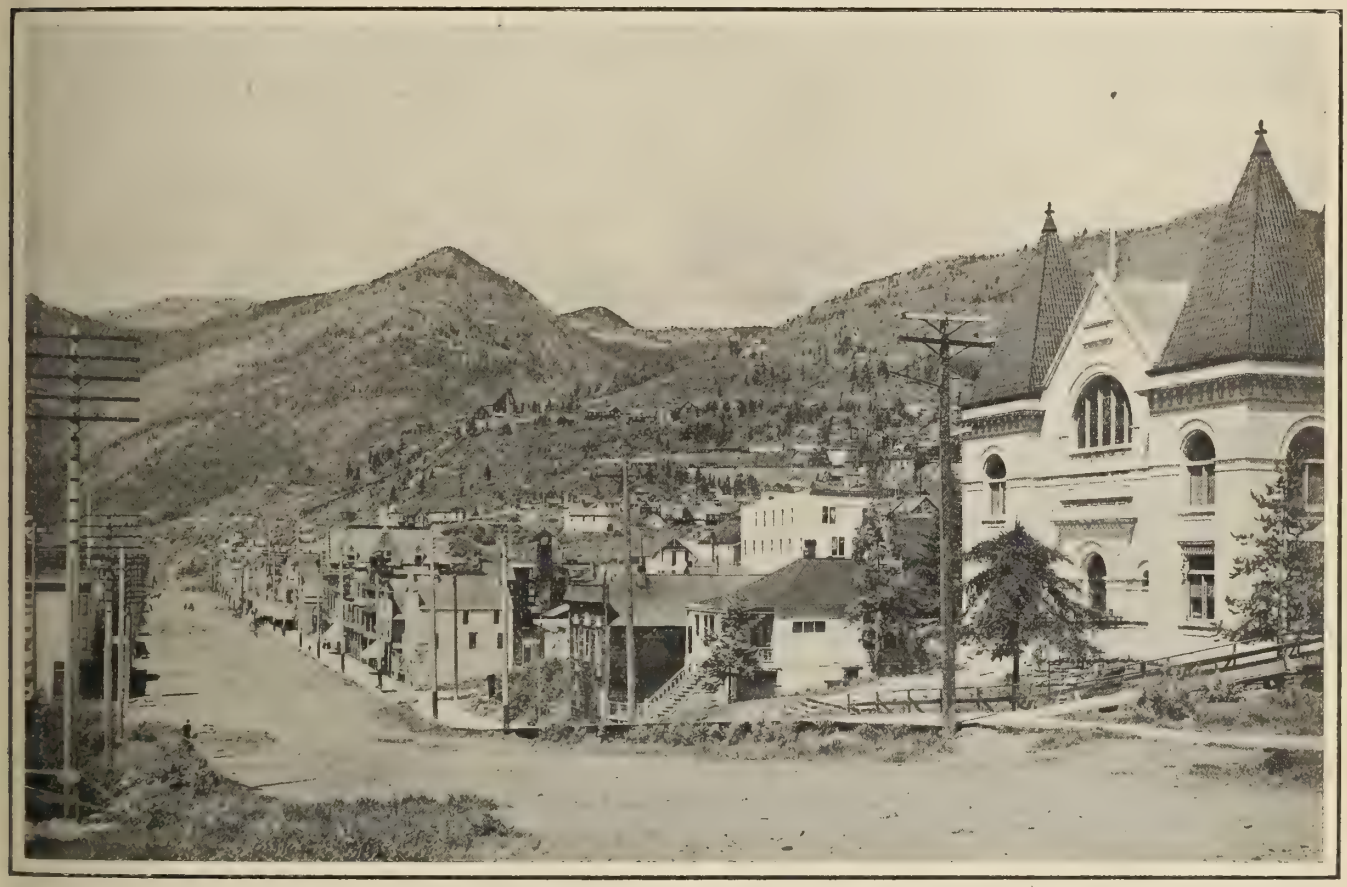
The causes for a decrease in 1906 as compared with 1905 in the production of placer gold, lead, zinc, and coke, respectively, were temporary, and the reasonable expectation is that they will not similarly affect the production of those metals in 1907.

As exhibiting the importance of mining in comparison with other staple industries of British Columbia, the following estimate of production in 1906, made by "The Victoria Colonist," at the close of that year, is submitted:—

Lumbering	$ 9,500,000
Agriculture	8,000,000
Fisheries	8,000,000
Together	$25,500,000
Minerals	26,350,000
Manufactures	11,000,000
Total	$62,850,000

It will be seen that the estimated total value of the mineral production exceeded that of the products of lumbering, agriculture and fisheries combined. While this is a decidedly creditable showing for the mining industry of the Province to have made, the immediate outlook is that when the time shall come for a corresponding comparison for 1907 to be made, the mineral production for that year will be found to have reached a still more favorable relative position.

In general, the auriferous black sands of California may be described as consisting of hard minerals ranging in specific gravity from 3 to 7, mingled with small percentages of metals and metallic minerals reaching from 7 to 20 in specific gravity. Most of the value will be found in the sand below one-eight inch diameter.



As to the relative value of disseminated and vein graphite, it is held by a Canadian authority, Mr. H. P. H. Brumell, that the advantage lies with the former variety by reason of its uniform character and continuity of deposits.

THE CONSOLIDATED MINING AND SMELTING CO. OF CANADA, LIMITED, ROSSLAND, B.C.

GEO. A. OHREN.

The advent of the Consolidated Mining & Smelting Company of Canada, Limited, into Rossland camp has been an important step towards establishing a prosperous future for this district. The first move in the formation of this country, the consolidating of the War Eagle and Centre Star interests, in the latter part of 1906, was made at a time when mining affairs looked glum, indeed, for the low grade properties of Rossland. It was the general understanding, from reports made by prominent mining men, that there was practically no ore in sight in the mines on Red Mountain, and that the future outlook for these (now prosperous) properties was not assuring by any means.

The amalgamation of the Centre Star and War Eagle holdings

COLUMBIA AVE., ROSSLAND
Consolidated Properties in Red Mountain to Right of Photo. Le Roi Headworks also to right.

being completed, the promoters absorbed the interests of the St. Eugene Mining Company at Moyie, B.C., controlling Canada's premier lead-silver mine, and those of the Rossland Power Company and the Canadian Smelting Works, at Trail, B.C., six miles, as the crow flies, from Rossland; the latter concern being one of the most up-to-date copper smelters and lead and silver refining plants in the West.

One laudable feature of the consolidation was the straining off of a considerable quantity of "water" from the capital of the combined interests over five million dollars having been written off the former capitalization.

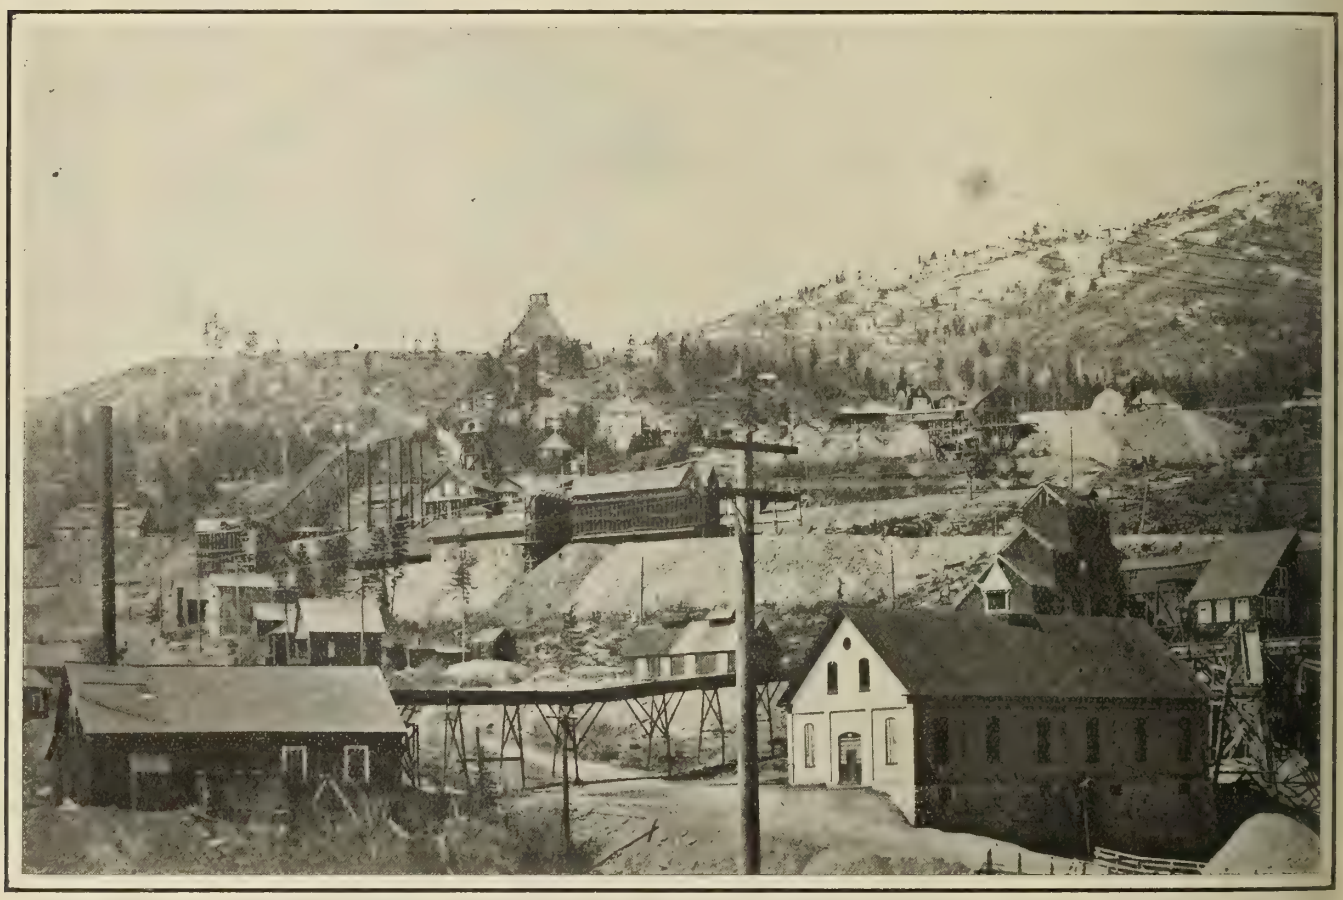
The company was capitalized on the following basis:—

St. Eugene Mining Company—Old value, $3,500.00; new value, $2,333,300.00.

Centre Star Mining Company—Old value (estimated cost), $4,666,667.00; new value, $1,555,500.00;.

Trail Smelter—Old value, $1,500,000.00; new value, $750,000.00.

Rossland Power Company—Old value, $600,000.00; new value, $60,000.00.



Total old value, $10,266,667.00. Total new value, $4,698,800.00.

The Consolidated Company has just completed negotiations for the Idaho and Enterprise properties, adjacent to the Centre Star, in this camp. The completion of this transaction gives the Consolidated control over the following group of very valuable mineral claims, which adjoin one another and can be worked on an economical basis: Centre Star, War Eagle, Iron Mask, Idaho, Enterprise, Mugwump, Pilgrim, Monita and Red Mountain. These claims represent the consolidation of five different mining companies' interests, as the Centre Star, War Eagle, Iron Mask, Mugwump and Red Mountain were at one time owned and controlled by five different companies, from whom the Consolidated subsequently acquired them.

Under the direction of Mr. R. H. Stewart, mines manager, more ore has been opened up in the properties and blocked out than ever before in the history of the mines, and there is no doubt in and about the mines and shipments of ore largely increased, which will mean more dividends for the shareholders and greater prosperity for this district.

In the report to the shareholders, for the last fiscal year, ended June 30th, 1906, it is shown that after writing off the expenses of incorporation and $45,905.00 as depreciation on plant and equipment, the operating profit was $325,854.93. From this a special reserve of $20,000.00 was provided, and two dividends, amounting to $234,940.00, had been paid, leaving a balance to the credit of the profit and loss account of $70,914.93. Needless to say, the report for the fiscal year ending June 30th, 1907, will surpass the above showing, and it is to be regretted that it is not at hand at the time of this writing, that comparisons might be made.

In addition to the aforementioned properties and interests, the Consolidated Company is operating the Snowshoe Group in

VIEW OF WORKS CONSOLIDATED MINING AND SMELTING COMPANY, ROSSLAND, B.C

but that the Consolidated Company will enjoy a prosperous life for many years to come.

A hundred and one facilities and improvements have been made in the mine and surface workings during the last few months. A large amount of development work and thousands of feet of diamond drill prospecting have been carried on in the mines; new and more commodious buildings have been erected on top; they have installed their own rock crusher and automatic sampler, now doing this work at the mines that previously was done at the smelter, with more or less inconvenience to all concerned. They have greatly augmented their air compressing plant, and at the present time are installing three electric locomotives, for hauling ore underground, and a one thousand horse-power steam hoisting plant. This engine will lift a load of ten tons, including the skip and the heavy 1 1-4 inch cable, at the rate of two thousand feet per minute, and when the installation of this collosal hoist and their air compressing, electrical and other machinery now being put up is completed, many more men will be put to work

Phœnix (Boundary) camp, under a lease from the Snowshoe Company. This group consists of the Snowshoe, Pheasant, Alma Fr and Fairplay Fr. They are also installing some new machiner and increasing their air compressing plant at that point, an will work the property on an extensive scale in the immediat future.

The Centre Star, War Eagle and Idaho claims were among th first located on the southern slope of Red Mountain; the loca tions being made in July, 1900. The War Eagle group was sol in December, 1896, to the Gooderham Syndicate, of Toronto, Ont for $700,000.00, after it had paid the former owners $187,500.0 in dividends. Patrick Clark bought the property with anothe claim and a two-thirds interest in the Iron Mask for $25,000.0(in 1894. The Centre Star was purchased by Oliver Durant an associates in 1891, and in 1897 was bought by Geo. Gooderhan of Toronto, for $2,000,000.00.

Teh Ware Eagle paid $545,250.00 in dividends, and the Centr Star the sum of $210,000.00, before their absorption by the Co

solidated Company, which has paid quarterly dividends of 2 1-2 per cent. since the declaration of their first division of profits, May 1st, 1906, and to date have paid their shareholders $587,350, including the dividend just declared.

The smelter at Trail was built in 1896 by F. Aug. Heinze, of Butte, Mont., who built the first railway (narrow gauge) into Rossland, from that point. The initial shipments of ore treated at the Trail smelter cost the mine owners around fourteen dollars per ton for freight and treatment. This rate has been reduced step by step during the last few years, until at the present time the smelter is handling low grade Rossland ores for four dollars per ton, and, it is stated, under that, at which treatment rate there are mountains of low grade ore in the hills surrounding Rossland which can, and will, be mined and treated for many years to come.

STATUS OF THE MINING PROFESSION

By J. C. Gwillim, Kingston, Ont.
(Toronto Meeting, 1907.)

At the late meeting of the American Mining Congress, October 16th to 19th, 1906, Governor Pardee, of California, introduced the draft of a bill intended to make the dishonest promoter fear the law. The bill is as follows:—

"An Act to prohibit the making or publishing of false or exaggerated statements or publications of or concerning the affairs, pecuniary condition, or property of any corporation, joint ments of publications are intended to give, or shall have a tendency to give, a less or greater apparent value to the shares, bonds, stock association, co-partnership, or individual, which said state- or property, or any part thereof, of said corporation, joint stock association, co-partnership, or individual, than the said shares, bonds, or property shall really and in fact possess, and providing a penalty therefor.

"Section I. (Enacting Clause).—Any person who knowingly makes or publishes in any way whatever, or permits to be so made or published, any book, prospectus, notice, report, statement, exhibit, or other publication of or concerning the affairs, financial condition, or property of any corporation, joint stock association, co-partnership, or individual which said book, prospectus, notice, report, statement, exhibit, or other publication shall contain any statement which is false or wilfully exaggerate, or which is intended to give, a less or greater apparent value to the shares, bonds, or property of said corporation, joint stock association, co-partnership, or individual, or any part of said shares, bonds, or property, than said shares, bonds, or property, or any part thereof, shall really and in fact possess, shall be deemed guilty of a felony, and upon conviction thereof shall be imprisoned for not more than 10 years, or fined not more than $10,000, or shall suffer both said fine and imprisonment."

The Congress unanimously adopted the bill, and the following resolution:—

"That the officers of the American Mining Congress respectfully suggest to Governors of States and Territories that when in any State which has adopted the law, known as the Pardee resolution, charges of its violation are made, the Governor of the State in which alleged mining properties are claimed to exist, at his discretion may, upon request, authorize the Commissioner of Mines, or other appropriate officials, to examine such alleged mining properties sufficiently to determine and report on their approximate reality, and the State may charge a reasonable fee to cover the cost of such examination and report, this fee to be paid by the parties requesting such examination."

The following resolution was also adopted:—

"That a committee of five members be appointed by the President of this Congress, for the purpose of devising and demonstrating methods for preventing fraudulent mining schemes, and report the same to the Secretary of this Congress eight weeks before the meeting of its next session, who shall mail such report to each member of this Congress at least three weeks before its next session."

There has been some comment upon Mr. Pardee's resolution. Some affirming that so long as a constituency of dupes and gamblers is to be found, so long will the "get-rich-quick" scheme prosper. Others again suggest that all the mining engineers in Denver look up the cases, which should be investigated to prove misrepresentation.

It is argued, moreover, that we now have a law covering the obtaining of money under false pretences, by which men may be found guilty of misdemeanor or felony, according to the magnitude of the offence.

The fact, however, stands, that misleading literature and often absolutely untruthful statements are circulated to a lamentable degree by company promoters, without challenge. Yet the effects thereof are ruinous to legitimate mining.

To the Journal of the Federated Canadian Mining Institute for the year 1897, the late Mr. J. Bawden, barrister, of Kingston, contributed a paper on the subject of "The Economics of Joint Stock Companies," written at the time of the late British Columbit mining speculation.

At the present time, in Ontario, and in many other mining districts of this continent, conditions are not dissimilar to those obtaining in 1897. It may not, therefore, be out of place to call attention to some passages in Mr. Bawden's paper, relating to the promotion of the gambling element in mining. He says: "Let the buyer beware. The law interferes only to protect men's stomachs from adulterated food, not by any preventive process to protect from pickpockets in the guise of vendors of valueless shares. The question whether in the interests of the public it is advisable to interfere with the right to sell valueless shares lest individual liberty and the inalienable rights of British subjects be imprudently invaded, is a question of expediency which those who have at heart the development of mining enterprise may discuss without a tilt with brokers or jurists. The sale of worthless shares injuriously affects the sale of valuable shares. It goes without saying that capital seeking investment in mining shares is a limited quantity; that it is coaxed out of hoards, at the cost of much wind in the form of reports, advertisements, puffs, editorials; and that the characters of many people are staked upon representations, sometimes made in good faith, but too often discredited by adverse results. The argument, therefore, against the legality of worthless shares is founded on the economic ground that the business should be prohibited by legislation because it will work irreparable injury to honest enterprise."

It is often affirmed that mining is, in any case, a gamble; this is not true. There are many mining enterprises carried on in such a way that the gambling element is almost eliminated; but these *bona fide* enterprises cannot operate in a field where properties have been given a fictitious value, due to stock promotion and manipulation. It is said *Chance* is so large a factor in mining that, from the view of the investor, this industry suffers in comparison with other industrial enterprises. But, the writer ventures to assert, if roguery, misrepresentation, and lack of skill were emilinated from mining, to the same degree as they are absent in the operation of railroads, manufactures, and

other industrial undertakings, we might deal successfully with the element of chance, and reduce speculation to investment. Mr. Bawden further remarks: "Industrial stocks cannot be put on the English market without estimates carefully prepared by chartered accountants. The plan of organization of such companies leaves nothing to be desired in the way of reasonable safeguards for the protection of shareholders." And again: "The mining share certificate neither binds nor obliges any. In fact there is not a more innocent, vague, unrepresentative and yet plausible piece of paper in the world than a mining share certificate. It may stand for a share in a mine which has no existence; for a part of the capital of a scheme which never had and never will have a dollar in its treasury; or it may represent the title to a share in a 'bonanza,' honestly administered, paying the largest profits ever realized, and be good documentary evidence of the ownership of value many multiples of the money share stated on its face."

Such a condition is accepted by many of us as inevitable. If, then, mining is so much at the mercy of chance and unscrupulous people, what is the object of educating men to become technical engineers, unless it be to infuse into the industry a higher level of honesty and attainments, which shall do as much for the mining profession as Scientific Medicine has done for sickness, to eliminate "The Act of God" and "Ignorance"? Surely the jeopardy of life is as great as that of mines. Yet medical science has gathered honor and a considerable control of its specialty. Mr. W. R. White, in the discussion following Mr. Bawden's paper, said: "I do not agree with Mr. Bawden's position, when he speaks in regard to the institutions that are turning out young men; I do not think these young men when turned out are competent to do much more than push a barrow in a mine. They may get technical knowledge, but they require the practical experience before they become mining experts or engineers; they are no better than beginners in any other profession in this respect."

A period of probation is certainly necessary to acquire experience and knowledge in all professions. It would be a benefit to mining engineering if all who are training could work for a time as "understudies." A great majority now do this, but there seems to be no good reason why a mining graduate should pass through the mucking, wheelbarrow stage while graduates in civil engineering, law or medicine pass directly into professional work. Surely there are equally wanting in practical experience. Moreover, the graduate of our mining schools is nowadays as well equipped as men graduating into other professions to do efficient service. Give him his place and honor, and he will work as honestly and as well as any other young professional man. The every day accusation against mining is its *Chance* and *Misrepresentation.* Surely the technical graduate has not spent four years in learning how to increase these factors. Mismanagement is not often in his power, and if it is, he has as much at stake as the practical man. Concerning this, Mr. Bawden says: "As a general rule, the so-called mining expert is, in cases of mispresentation, the chief wrong-doer. The evil will, it is hoped, diminish with the increase in numbers and respectability of mining engineers. The director is often the dupe of the expert and prospector as the means of luring ignorant shareholders. The engineering profession owe it to themselves and to the best interests of the country that they shall have a registered membership.

"We shall have ere long a registered body of mining engineers zealous for the reputation and honor of a learned and noble profession, from whose lists will be struck off any guilty of unprofessional conduct." The codes of professional ethics in civil engineering, law and medicine demand the protection of the public in their own interests. In mining, the investor cannot invest because of the speculative and fictitious values of mining property. While, on the other hand, the graduate, or otherwise trained and honest engineer is forced to compete professionally with a host of so-called and self-styled "mining men" who are ready enough to become the tools of the promoter. But the question remains, how to remedy this state of affairs. The channel chiefly used by the promoter to reach the public is the newspaper advertisement, carefully worded and couched in the language of exeggeration, calculated to entrap the unwary. It is well known that it is no difficult matter to secure all the capital necessary to exploit a really meritorious mining property without resource to advertising; and, consequently, the majority of schemes to which the public are invited, by the advertising method, to subscribe, may be regarded with suspicion. The press, meanwhile, disclaims responsibility; the statements, as published, are frequently not even vouched for by a reputable person, much less by a technically qualified man; yet the public speculates, and the mining profession loses both credit and occupation.

Among the purposes for which the Canadian Mining Institute was founded are these: "To take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada"; and "to encourage and promote these industries by all lawful and honorable means."

Dr. J. Bonsall Porter, discussing Mr. Bawden's paper as above mentioned, remarked: "We engineers cannot, of course, undertake the Herculean task of putting down or even denouncing all of these frauds, but I do think that many of us, and perhaps the Society as a unit, falls short of its real duty'.'

The writer would suggest that the Canadian Mining Institute, which is in part supported by annual grant from the Federal Government, undertake to deal with at least this abuse, namely, the publication of prospectuses of an irresponsible character, the statements in which are not vouched for by some person of recognized standing.

If such advertisements disappear entirely under these restrictions, the loss will fall only on newspaper publishers and on those who prey upon or mine the public. Meanwhile other professions are protected by legislation whereby they are raised above the level of the unscrupulous and incompetent. The Manitoba and Quebec Acts of the Canadian Society of Civil Engineers are for the purpose of the protection of both public and profession. So are the British Columbia Assayers' Act and the Acts which protect the legal and medical fraternities. If any unqualified or irresponsible person were permitted to practice his profession without question, what complications and dangers would ensue! The State interests itself in mining to the extent of taxing, limiting and protecting the prospector, and inspecting his claims, but there is yet no effective law to protect the public from the fradulent promoter, or to provide for the inspection of so-called mines offered to the public. The press, as an interested party, aids and abets the promoter, whose prospectus is circulated among thousands of readers who know nothing of mining, mining engineers or conservative mining journals.

To remedy this evil, such advertisements should be published subject to restrictions and in fear of penalties, as suggested by the Mining Congress. There might also be stricter regulation governing the issuance of letters patent incorporating companies. Promoters should ,furthermore, be made personally responsible and answerable for their published statements. Again, an incorporated company, before going to the public, should be required to have paid-up capital to a reasonable amount, which would at least be paid in first of all; this would ensure the company having some guarantee of *bona fide* intention. This paid-up capital might be either held as a guarantee fund or used in the company's operations. The company might be made responsible for the statements contained in the prospectus issued, and this fund held available for any loss sustained.

A method which would apparently prove most effective would be to insist that reports for prospectus purposes be prepared and signed by professional men, who would be brought to book professionally for misstatements or misrepresentation.

Mr. George E. Collins, writing in the *Denver Mining Recorder,* anent the "Pardee Resolution," says:—

"The only people competent to say whether a man is qualified to practise as an engineer are his own fellows. I think the time

has come for the American Institute of Mining Engineers to follow the example of its English junior (The Institution of Mining and Metallurgy) and confine its membership to such as have attained a definite standard of qualification and experience. This qualification, in any case, could not mean much, but would be better than nothing. . . Later, State Legislatures could enact that no person should be placed in responsible charge of property employing more than a certain number of men, or should presume to make a written report for money on a mining property unless he were a member of this body.''

An editorial leading article in the same journal, October 19th, 1906, contains the following praagraph:—

''Has not the mining industry reached that degree of importance and magnitude when some States, at least, should take steps to discriminate in regard to who shall practise the science and art of mining? It is sometimes said, surely the qualified man can compete successfully; therefore why form a protection for him? The protection as in civil engineering, medicine, and law, is not wanted for merits, but for honest, competent work to replace misrepresentation.''

RECENT MINING DEVELOPMENT IN THE SOUTHERN YUKON

By D. D. Cairnes

(*Continued from page 87*).

minerals being galena, with sometimes grey copper, chalcopyrite, pyrite, melaconite, and malachite, and, as a rule, are very persistent and can be traced in some instances for several miles. Outcrops of quartz, very much resembling each other, are seen in almost straight lines, at short intervals, and with the same general strike from the Watson river to about 8 or 10 miles south of the Wheaton river, a distance of nearly 20 miles. Although most of the veins found were in this belt, about 2 miles wide; towards the end of the season Mr. Porter and others discovered some large deposits of quite pure stignite, and other minerals, at a considerable distance west of this belt.

Only a small amount of the rich telluride minerals, which were sylvanite, hessite, and telluric ochre, was found, but no work had been done on any of the claims, when last seen, except a limited amount on the Gold Reef. A government wagon road was built from Robinson to Gold Hill immediately after the discoveries were made. Assays as high as $300.00 and over, in a place or so, and a number of fairly average assays from $20.00 to $60.00 were obtained. Recently the writer has been informed by several disinterested parties that the Tally-ho Mining Company, whose property is situated on the north side of the Wheaton river, in the line of this Gold Hill mineral belt, has over two feet of quartz at the end of a 70 foot tunnel which averages over $200.00. The rest of the vein is lower grade. The property is still working, and the ore is being freighted out to Robinson to ship to the Tacoma Smelting Works.

The copper deposits just west of the town of Whitehorse have been known for some years, and considerable work has been done on some of the properties. However, for several reasons these have not developed as rapidly as might have been expected. Freight rates were high, either for getting in supplies or shipping out ores, and to treat the ore on the ground coke was required, and no coking coal was known to exist in the country; and to bring in coke made treatment very expensive. Also one of the first reports written on the district was one by R. H. Stretch, written for the W. P. & Y. Railway, but which was afterwards published in the *Engineering and Mining Journal*, in September, 1900, and which may also have had a tendency to keep capital out. In this report Mr. Stretch claimed the granites would be found underlying the limestones, felsites, and diabase dykes, and the ore bodies were only superficial and would not extend down more than a few feet. The writer saw no reasons for adopting this theory.

Mr. Wm. M. Brewer, in an article in the *Engineering and Mining Journal* of February 1st, 1902, and also in a paper read before the Canadian Mining Institute in 1905, has given a very concise and clear description of the district and a number of the properties, drawing attention in particular to the striking resemblances between these deposits and those on Texada Island. Recent work in both places has further proved the similarity of the deposits in these two localities; and as those on Texada Island have improved from the surface to their present depths, there is every reason to believe that the Whitehorse deposits will do the same. For recent information regarding the Texada Island deposits the writer is indebted to Mr. O. E. LeRoy, of the Geological Survey, who examined them this last season.

The writer agrees with Mr. Brewer in regard to the Whitehorse deposits, except as regards their origin. Only a very casual examination was made this summer, but from what was seen in the field, and from examinations of specimens since, it seems almost certain that the felsite rocks in which the ore occurs are of secondary contact origin and not intrusives, and that the granites are directly the cause of the deposits and are connected gentically with them. A thin section of a typical specimen of the felsite shows it to be a mosaic of spinel with some pyroxene and to be clearly of secondary contact origin.

This season Byron N. White, of Spokane, has been working the Pueblo nearly all summer, and is still continuing, and when seen in October this property presented an enormous surface showing. A body of ore, approximately 225 feet by 250 feet, was uncovered, and a shaft had been sunk over 100 feet on it, and no walls had as yet been encountered. The ore on the Pueblo is hematite, strongly impregnated with the copper minerals, chalcopyrite, bornite, malachite, cuprite, and even some native copper. Aside from the copper values in the ore, the hematite itself will be valuable for fluxing, when smelting operations commence in this district. On most of the properties magnetite takes the place of the hematite. Ore is at present being shipped from the Pueblo to the Britannia smelter at Crofton, B.C.

The Carlisle shaft has been sunk over 115 feet, and 100 tons of ore were shipped from this property this summer. The Arctic Chief is working at present, and is reported to be steadily improving.

So in this district from the British Columbia and Yukon boundary to Whitehorse, a distance of approximately 100 miles, there are a variety of mineral deposits which extend over a considerable portion of the district, showing how widely mineralized this section is. Added to this is the fact that there is a fair amount of good available coal in the Yukon.

Just south of the Whitehorse copper deposits, and between them and Gold Hill, is a belt of anthracite coal which has been worked to some slight extent about 12 miles in a southwesterly direction from Dugdale on the W. P. & Y. Railway. The general strike of the measures is about true 74 degrees west. A 60 foot tunnel has been run in on one of the seams. Here the strike is true 63 degrees west, with a 42 degree dip to the northeast. Three seams were seen, being respectively 9 feet 6 inches, 10 feet 4 inches, and 2 feet 6 inches wide, and others may be covered by the heavy wash in the valley. The samples tested were surface samples, and consequently ran very high in ash. The coal should make a good fuel, and, as there is a good grade from the railway to the coal claims, and as the coal is close to the copper deposits, the Watson and Wheaton rivers deposits, and the town of Whitehorse, this coal should be of considerable value to the district.

Down the river from Whitehorse, about 190 miles, or somewhat less than half way to Dawson, is the Tantalus Coal Mine. As the coal outcrops here on the river banks, it is well situated to work economically. Most of the river steamers burn this coal, and about 7,000 tons will be loaded this season. There are three workable seams opened up, only the lower two of which are being worked at present. Other seams may be found, as the formation is heavily covered in most places. The coal is worked by the stall and pillar method from two tunnels, which were in about 700 feet

when visited in October. The wages paid was $5.00 per day, with board and lodging for underground and $4.00 for surface work. The measures are quite regular and can be traced over 20 miles down the Nordenskiol river to the south, and for over 10 miles to the north, showing that there is an enormous amount of coal in this district. When the measures have been prospected more closely it is hoped that they may be found in some accessible points much closer to Whitehorse, because, as the coal gives good coking results in the laboratory, it probably will make a metallurgical coke. In that case, a smelter seems a probability in the vicinity of Whitehorse, where there is the ore, flux, and the water power.

The following section was measured near the end of the tunnels at the Tantalus Mine:—

		Feet.	Inches.
	Coal	2	4
	Shale	0	7
Bottom seam	Coal	2	0
	Shale	0	8
	Coal	2	11
	Shale	4	0
	Coal	2	3
	Shale	0	2
	Coal	0	7
Middle seam	Shale	0	2
	Coal	2	0
	Shale	0	2
	Coal	1	8
	Shale	7	0
Top seam	Coal	3	0
	Shale		

Analyses of coal from these three seams are:—

Water	0.75	0.76	0.82
Volatile combustible matter	23.61	24.74	25.12
Fixed carbon	55.21	58.60	66.03
Ash	20.43	15.90	8.03
	100.00	100.00	100.00
Coke per cent	75.64	74.50	74.06

These coals yield in the laboratory a firm coherent coke.

This paper has been intended to give merely a general description of the different classes of mining in the Southern Yukon, rather than to give detailed descriptions of any particular locality, as quartz mining seems to be one of the permanent future industries of the district.

ASBESTOS IN FOREIGN COUNTRIES

By Fritz Cirkel, Mining Engineer, Montreal.

(*Continued from page 55*).

About ten years ago asbestos was discovered in what appeared to be payable quantities in West Griqualand. The asbestos had a peculiar blue color, caused by the large proportion of iron protoxide it contained. It created quite a sensation on the London market. It was generally found in veins seldom less than two and more often four and five inches wide, formed of closely compacted parallel fibres. The output during the year 1898 was, on an average, about 100 tons per month, and the prospects for an increase seemed at times very bright. Very little skilled labor was employed, the mining being mostly surface work, or by shallow adits run in the sides of the hills. The cost of extraction, even with the primitive mining methods employed, was about twenty-five dollars a ton. But with all these advantages the business connected with the mineral has not been prosperous. Although the blue Cape asbestos was claimed to be as good as or superior to the white Canadian asbestos for many special purposes, it was, nevertheless, found that the introduction of this mineral into the trade was not making the rapid progress that was looked for. In 1898 the sales amounted to £9,000. In 1901, according to official reports, the production sank to £1,600, and for 1902 no production was reported. This ended the whole asbestos industry, for the present anyway, in Cape Colony.

Recently, however, information has been received that asbestos has been discovered in the Transvaal in the Carolina District, and it is reported that several companies are already in the field. The extent of the asbestos area is said to be considerable. It is further asserted that the asbestos is of an excellent quality, and so the report goes—can be separated or cleaned without the aid of machinery. (!)

The asbestos occurs in serpentine, cutting a cherty formation with bands of manganiferous earth. The latter, on account of its loose condition, is likely to give considerable trouble in mining. The mode of working the asbestos on a large scale has not been decided upon. Mining and shipping, it is said, may cost as much as £20 per ton, and a profit of from £15 to £20 is anticipated, in view of the excellent market conditions. According to the statement of the miners, the only treatment necessary is "cobbing." This, it is believed, will not cost more than 10s. per ton. No expensive machinery is required. The nearest railway station is Wonderfontein, about fifty miles distant, but the new "Springs Eastward" line will bring the property within half that distance. Native labor is at present scarce. The Carolina asbestos is of abnormal width, according to experts' reports, and equal to the finest in the world.

There are now three companies in the field, viz., The Transvaal Asbestos Syndicate, now absorbed by the Consolidated Gold Fields; The South African Minerals Option Syndicate, a subsidiary of the Bechuanaland Exploration Company, and The Anglo-Swiss Asbestos Company. On one of the properties, that of the Consolidated Gold Fields, it is estimated that there are 150,000 tons of asbestos in sight. This property comprises the Diepgezet farm, in extent about 7,000 acres. Samples of the asbestos from this property were sent to England and America, and replies were received that a ready market existed for the class of material submitted. A ten-ton shipment of almost entirely outcrop stuff, was made to England, and £21 profit realized per long ton. An offer was made for the better class of stuff from Germany at £40 and from England at £45 per long ton.

The South African Minerals Option Syndicate owns the Victoria and Rietfontein farms, and on each of these asbestos has been discovered in several places. The Anglo-Swiss Company are working near Gooderwacht, and it is believed that the mine contains about 200,000 tons of asbestos of No. 1 quality. It must be mentioned that, in view of the small amount of work which has been done on this property, this statement cannot be taken seriously.

A REVIEW OF SOME RECENT SCHEMES FOR CLASSIFICATION OF COAL.

By A. L. MacCallum. Paper read before the Nova Scotia Mining Society.

The classes of coals recognized in this country are various. They depend largely on physical characteristics rather than upon chemical composition, and consequently they cannot be accurately defined.

The divisions into anthracite, semi-anthracite, and semi-bituminous, are fairly satisfactory, but the term bituminous embraces such a variety of coals that it is of little value, and the term lignite is so loosely applied that it has little or no place in a scientific classification.

This classification was based on the fuel ratio which was described as the quotient of the fixed carbon divided by the volatile matter. From this the following classification was adopted:—

Anthracite fuel ratio	100 to 12
Semi-anthracite fuel ratio	12 to 8
Semi-bituminous	8 to 5
Bituminous	5 to 0

The great advantage of this scheme over those previously used is that it is based on certain definite constituents of the coal, and these constiuents in a general way determine the fuel value of the coal, but when an attempt was made to apply this classification to the various coals of the United States it was found to be unsuitable.

By this classification the low grade coals of Iowa and Missouri would be in the same class as the best West Virginia and Pennsylvania coals. Also, there is no provision made for lignites.

In connection with the work done at the coal-testing plant of the United States Geological Survey at St. Louis, the following schemes of classifications were tried:—

I.—Fraser's fuel ratio as above, which proved unsatisfactory, especially in the low grade coals.

II.—*Fixed Carbon.*—This also proved unsatisfactory with low grade coals.

III.—*Calorific Value.*—This is better for low than for high grade coals, as in some cases bituminous coals have a higher calorific value than anthracite.

IV.—*Hydrogen.*—No satisfactory classification could be based on this.

V.—*Carbon.*—This proved fairly satisfactory, but in many cases it is impossible to distinguish between true bituminous coal and lignites.

VI.—*Carbon Hydrogen Ratio.*—These are the two chief fuel elements in coal. In the progressive development of brown lignite to anthracite, the carbon increases (or at least does not diminish), while the hydrogen decreases.

The quotient of the hydrogen into the carbon was found to be a very satisfactory basis for classification, yielding the following distinct classes:—

Group A—Graphite	0	= 0
B, C—Anthracite	30	= 26
D—Semi Anthracite	26	= 23
E—Semi Bituminous	23	= 20
F—Bituminous	20	= 17
G—Bituminous	17	= 14.4
H—Bituminous	14.4	= 12.5
I—Bituminous	12.5	= 11.2
J—Lignite	11.2	= 9.3
K—Peat	9.3	= 7.2
L—Wood	7.2	=

Quite recently this scheme has been rather sharply criticized by Professor Kerr. He suggests a new basis for classification, which seems to be extremely rational.

He bases his systems on two fundamental facts.

I.—The ratio of the total to volatile carbon.

II.—The amount of inert volatile matter.

The volatile matter in coal is often spoken of as volatile combustible matter, which is not absolutely correct, as there is a part which is not combustible, being, in fact, water formed from the oxygen and part of the hydrogen occurring in the coal.

This is the inert volatile matter. It is higher in the lower grade of coals.

The ratio involved is expressed by the formula VC x 100-C, in which VC is the volatile carbon and C the total carbon.

According to this scheme coals are classified as follows:—

Anthracite	$\frac{100}{VC}$ x	=	below 4
Semi Anthracite	"	=	" 4 to 8
Semi Bituminous	"	=	" 10 to 15
Bituminous A	$\frac{100}{VC}$ C =	20	= 32
	Inert Volatile	5	= 10%
Bituminous B	$\frac{100}{VC}$ C =	20	= 27
	Inert Volatile	10	= 15%
Bituminous C	$\frac{100}{VC}$ x C	32	= 44
	Inert Volatile	5	= 10%
Bituminous D	$\frac{100}{VC}$ x C	27	= 44
	Inert Volatile	10	= 15%
Black Lignites	$\frac{100}{VC}$ C	27%	up
	Inert Volatile	16	20
Brown Lignites	$\frac{100}{VC}$ C	24	= up
	Inert Volatile	20	= 30%

The values involved in this table are, of course, calculated from analytical data.

Taken altogether, I think this is the most satisfactory scheme that has yet been proposed. It gives some definite, tangible value to the terms anthracite, bituminous, etc. It is, in addition, based on strictly scientific principles.

I am glad to learn that our own Survey proposes to undertake with our own coals similar work to that which is being carried on at St. Louis. This cannot help being very beneficial if properly carried out. For one thing, it will bring more up-to-date the analytical data appearing in Government reports on coal. Possibly from data obtained they may propose a new and better scheme of classification.

CORRESPONDENCE

THE CANADIAN MINING JOURNAL, while it welcomes letters of criticism or correction, or of general interest, is not responsible for opinions expressed in this column.

To the Editor, CANADIAN MINING JOURNAL:

Dear Sir,—In your last issue, of April 15th, you publish an article on "Graphite in Canada" from the pen of your special correspondent. As one very deeply interested in the future of this industry, I beg to take exception to the article on account of its glaringly apparent intention to advertise certain properties and particular machines manufactured by some of the parties interested in them, and to the statement that it is "specially due to the untiring efforts of some enterprising Americans" that "lately great attention has been paid to Canadian deposits." The entire article is misleading, inasmuch as the reader is led to infer that all the activity in this mineral is confined to the operations of some Americans at the Diamond Graphite Company's works near Buckingham, and at the works of the Calumet Mining & Graphite Company at Calumet. Credit must, of course, be accorded these gentlemen, and is given freely by all of us, but not to the exclusion of a greater number of Canadians who have for years fought the prejudice so commonly held in the United States against our product. No mention is made in the article of the Globe Refining Company at Port Elmsley, the Ontario Graphite Company at Calabogie, the Allan Mine at Allanhurst, all in Ontario, nor of the Buckingham Graphite Company, of Buckingham, Que., nor of the Canada Paint Company, near St. John, N.B., all of which are owned and operated absolutely by Canadians. In addition to these, active work is being prosecuted at the Bell Mine, near Buckingham, by British capital. Your article states that as well as the Diamond Company's mill another is in course of construction. This is certainly news to Buckingham, and those interested in graphite here. Your correspondent is, let us hope, without malice in his mis-information regarding the Diamond Graphite Company. He says the property is "situated five miles north of Buckingham, on the left bank of the Gatineau." It is about six miles north of Buckingham on the right bank of the Lievre, in another county. He states that their graphite area has a triangular shape with certain dimensions, which figures would indicate an area of about two acres. As to his statements relating to the mill, I will take no exception, except to state that I am informed, on the best authority, that the information relating thereto is very inaccurate. The illustration which accompanies the article is labelled Black Lake, Quebec, a somewhat misleading title for a photograph of the Bell Mine in Buckingham Township.

The entire article is full of glaring mis-statements, and it is particularly unfortunate that such should be published at the present time, as every endeavor is now being made to put the industry on a better and more permanent basis. For years we, in Canada, have had to fight prejudice and old-established business connections, and we are only recently getting for our Canadian product the attention of the graphite trade of the world.

If I may criticize the arrangement of your reading matter, I would draw your attention to the fact that you published an editorial on "The Promoter," on page 66, instead of as an introduction to "Graphite in Canada," on page 79.

Yours truly, H. P. H. BRUMELL.

Buckingham, Que., April 22nd, 1907.

SPECIAL CORRESPONDENCE

Nova Scotia.

The long-drawn-out battle, which many surmised was a battle between Nova Scotia's two giant concerns, the Dominion Iron & Steel Company and the Dominion Coal Company, has at last ended. The contest continued over a period of four weeks. The amendments to the Mines Act are now law, but they are not the amendments originally introduced. They have been cut and carved and chopped in a remarkable manner. Both parties profess to be fairly satisfied, so those not directly interested can afford to refrain from criticism. The purpose of the amendments is to afford facilities to owners of submarine areas to obtain access to the same, by going through the lands of other lessees which may intervene. One of the novel features of the bill is that the damages allowed the owners of the intervening areas are not to be allotted by arbitrators, but by the Governor-in-Council. The reason given for this is that the valuation of arbitrators might be appealed from to the courts, and operations delayed for, possibly, five years. To a lay mind it seems peculiar that a clause could not be drafted making appeals and delays impossible. It is now in order for the Dominion Iron & Steel Company to show that they do indeed purpose going into coal mining by proceeding to make arrangements to work the submarine areas at Point Aconi, south side of Sydney Harbor. It is said that the Dominion Iron & Steel Company has met with success in their borings, for coal, at the head of Lingan Bay. About a half mile from the Lingan Beach, outside of the Bridgeport Basin, and adjoining the Dominion Coal Company's areas, a five foot six seam of coal has been discovered. The company has not officially given out the thickness of the seam, but it may turn out that the thickness given is not far wrong. Suppose the Steel Company sets to work on this at once, it will take years before they can produce, in considerable quantity, at Point Aconi, and eighteen months before they can produce in appreciable quantity from the land area, near the head of Lingan Bay.

A new company, that purposes to be a producer on a large scale by 1908, is the North Atlantic Collieries, Limited. The property of this company is situated in what is known as the Cow Bay Basin. The workings will be submarine. It is stated, with a marked degree of confidence, that the coal extends for an almost indefinite distance under the ocean. At first the company proposed to approach their areas from the south side, but as the land areas are held by a party who places their value at a fancy figure, this purpose was abandoned, and instead the company will operate from the north side, and in order to do this will acquire, if they have not already done so, the property of the Gowne and Blockhouse, Limited. The acquisition of this property puts them in possession of a working colliery, not at present a large producer, but which can be made, at a comparatively small expense, capable of producing a thousand tons per day, or 240,000 tons for the year 1908. As the workings underground develope the output will correspondingly increase, and 1909 would likely see an increase of fifty per cent. on the preceding year's output. This company has taken several years to perfect its plans, and therefore there is every reason to believe that the project will be highly successful. There are no fewer than seven seams of coal on the property, the combined thickness of which is thirty-four feet. Henry M. Whitney, of Boston; Geo. E. Drummond, of Montreal, and B. F. Pearson, of Halifax, have consented to become directors. The fact of these well-known men being on the directorate conveys the impression that soon there will be something doing.

Contrary to expectations, the shipments of coal for March do not compare favorably with last year. There are some increases, but the large decrease in shipments of the Dominion Coal Company wipes all of them out. There are several reasons for short shipments, viz., stormy weather, scarcity of cars, and stoppage of work by the workmen. In March Cape Breton had three big storms, which put almost everything out of business. The men of Dominion No. 1 stopped work in an effort to get a number of "outsiders" into the P. W. A. lodge. Having accomplished this, the men signified their readiness to go back to work, but the management told the men as they had stopped work of their own accord they could stop off a while longer, while some repairs were effected in the pit. It was thought that the example set by the men of Dominion No. 1 would be followed by the men of the collieries. The officials of the Coal Company gave intimation that if there were any more of these stoppages the company would discontinue collecting the lodge dues in the pay office. This intimation seems to have had the effect of deterring the men in further attempts after the "closed shop." The coal companies in Nova Scotia have no objections that their workmen should be union men, indeed, they might prefer that all would be such, but if they can prevent it they are determined there shall be no coercion. At the beginning of the month the men at Springhill stopped work until all the men should join the union. They were out four days. Their stoppage was in violation of the new industrial dispute bill. The men claim that they were led to believe that the Act did not apply to the mines of Nova Scotia. The Deputy Minister of Labor informed the men by telegraph that the law was operative in Nova Scotia, but this had seemingly no effect; the men stayed away from work until they had accomplished their purpose. The men are each of them liable to a penalty of from ten to twenty dollars. Proceedings for recovery of penalty are left to private individuals. Will anyone prosecute? Is the law to be a screaming farce?

The Dominion Coal Company are still busy prospecting on their Lingan and Victoria areas. Notwithstanding reports in the press to the contrary, no site for the proposed new colliery has been decided on, nor is a permanent slope being sunk. The company may be bothered from an embarassment of riches. In what is called the Lingan section, there are three known seams, while in the Victoria section no one is prepared to say what the number is. It is claimed by those having knowledge of the locality that there are no fewer than eight workable seams in the Victoria section. If this be so, no wonder the company is perplexed as to which seam to attack. It is possible that the much talked of Mullins seam may be the scene of future extensive operations.

It is believed that the Local Government will assist, pecuniarily, a committee of the Mining Society, appointed to procure information as to the extent and the quality of the fire clays of the Province. In selecting each year a mineral for special consideration, the Society is to be commended.

Cobalt.

A local branch of the Canadian Mining Institute has been formed with Mr. A. A. Cole, M.E., as chairman, and Mr. Geo. Hardy, secretary. There are about fifty members of the Institute residing in Cobalt, and much interest is manifested in the new branch.

Mr. "Nick" Flynn has been appointed manager of the La Rose Mining Company.

Prof. R. W. Brock, of Kingston School of Mining, was in Cobalt for a few days.

Capt. Harris, of the La Rose Mining Company, has resigned.

Mr. T. Herriman is the new manager of the Temiskaming Mining Company.

Mr. Neil McDonald has resigned from the managership of the Beaver, and is now superintending the work at the Prince Rupert and Cobalt Coalition Mining Company's property.

ALGOMA.

The Jury Mining Company, of Dean Lake, are steadily progressing with their development work and preparing for mining on an extensive scale during the summer. A shaft is being sunk on the vein and is now down to the depth of 20 feet, while the appearance of the ore to this depth is extremely satisfactory. A number of prospectors have recently arrived in the neighborhood, but owing to the late spring the snow is as yet too deep to allow of any systematic prospecting being done.

A find of cobalt bloom is reported to have been made in Morin Township, twenty miles north of Bruce Mines, by a farmer, who states that he has discovered a vein extending over a quarter of a mile. This discovery is interesting, inasmuch as it is the first evidence of the existence of this mineral in the neighborhood.

The owners of the Herminia Copper Mine at Massey intend at an early date to erect a smelter at Thessalon for the treatment of their ores.

EAST KOOTENAY.

The Crannbrook Firebrick & Terra Cotta Company, Limited, with a capital of $50,000, in $1 shares, has been incorporated. Among the objects of the company is the manufacture and sale of firebricks and fireclay products for metallurgical, building and other uses.

Preparations are being made for the ensuing season's placer gold mining on both Wild Horse and Perry Creeks, in Fort Steele mining division. On the former the Invicta, Nip and Tuck, and Brown-Larsen properties, among others, will be worked. The heavy snowfall of the 1906-7 winter promises an abundant supply of water for gravel-washing purposes.

An enlarged output of lead-silver ore at the Sullivan Group Company's mine is reported. One recent week's production was about 1,000 tons, which is stated to be an increase of 30 per cent. over the ordinary weekly output for some time past. The ore is all treated at the company's lead smelter at Marysville, a few miles from the mine.

WEST KOOTENAY.

Nelson.—Several mines in the Nelson mining division give promise of making a better showing in 1907 as regards ore production than they did in 1906. These are the Silver King and Eureka, both situated within a few miles of the town of Nelson; the Queen Victoria, a copper property near Beasley siding, about seven miles west of Nelson; the La Plata, formerly known as the Molly Gibson, on Kokanee Creek, east of Nelson; and the well-known Ymir gold mine, in the Ymir section of the division, now under new management and provided with ample funds for further development.

The Silver King is to be worked by the Hall Mining & Smelting Company on its own account, the partnership arrangement between the company and Mr. H. S. Davys having been cancelled. An understanding has been arrived at with the owners of the adjoining Dandy mineral claim, permitting the driving of a tunnel from the Dandy into the Silver King mine, to connect with the workings of the latter at a depth that will drain the mine down to the seventh level without incurring the constant expense of pumping. All ore of payable grade accessible above that level will thereafter be mined and shipped to the smelter.

The Queen Victoria made its first shipments in March, in which month it sent about 400 tons of copper-silver ore of fairly good grade to the smelter at Trail. It is expected that the output for April will be about 1,000 tons, and that production will be gradually increased in later months. The ore is being broken down from a big bluff of mineralized rock, and is roughly sorted before shipment. Mr. N. J. Cavanaugh, formerly at the Slocan Star mine, is in charge of operations, in which 22 men are employed.

Ainsworth.—At the Krao mine the shaft has been deepened to 200 feet, and sinking is being continued, the intention being to go down to the 300 foot level. A station is being cut at the 200 foot level. Further development work is to be done on the 100 foot level, and drifting and cross-cutting at both 200 and 300 foot depth will be undertaken as soon as practicable. Some 20 men are employed at the mine, the work in which is being done under the supervision of Mr. W. E. Zwicky, manager of the Rambler-Cariboo mine in Slocan district.

The long tunnel in the Highlander mine is being extended, Mr. Geo. H. Barnhart, several years ago manager of the Ymir mine, having a contract for driving another 1,000 feet. Mr. Barnhart is also operating the Libby, Spokane and Glengarry properties, all in Ainsworth camp. Mining work in this camp will be much expedited and costs reduced should the owners of the Taylor hydraulic air compressor, installed in a neighboring creek in 1900 by the Kootenay Air Supply Company, Limited, again supply the mines with power. The first drill ever operated by compressed air under the Taylor patents was started in one of the Ainsworth camp mines in April, 1900. The revival of interest in local mines which has taken place during the last year will probably lead to this compressed air supply system being utilized to a greater extent than in former years when previously in operation.

Slocan.—Connection has at last been made between the old workings and the deep level tunnel of the Rambler-Cariboo mine in McGuigan basin. This striking achievement constitutes what is believed to be the most important mine development work ever done in the district. Work on this tunnel was commenced on July 9th, 1904 and continued until May, 1906, an adit having meanwhile been driven 4,600 feet straight into the mountain at a depth of 1,400 feet below the collar of the shaft and 600 feet under the lowest level of the old workings, the heavy cost of keeping which free from water having led to the undertaking of the extensive development work now completed. The face of the tunnel not having reached the vein at the distance above mentioned, it was decided to put up a raise; this entered the vein at 150 feet. Thence up to the bottom of the old shaft the raise was made large enough for after use as a three-compartment main working shaft (12 feet x 4 feet 6 inches in the clear). When this raise was within 17 feet of the 200 foot level above, a drill hole was put through and the large quantity of water filling the old workings up to the 450 foot level drained off through the new tunnel at practically no expense. The raise was then carried through and now the old mine is being cleaned up preparatory to stoping ore of which there was known to be enough to pay the large cost of the adit and raise, leaving out of consideration additional ore that might reasonably be expected to be made accessible by the new workings. Mr. Zwicky, manager of the mine, on whose strong representations this big work was undertaken, has been freely congratulated upon its successful completion. Immediately the roads are in a condition that will admit of hauling to the railway, the shipment of ore will be resumed. Prior to the stoppage of work in the old mine nearly $1,000,000 worth of ore had been shipped from it.

Rossland.—The output of ore from Rossland mines for the first quarter of the current year was rather above 62,000 tons. The Rossland Miner has published the following tonnage figures to March 30th:—

Mine.	Tons.
Le Roi	33,551
Centre Star Group	19,842
Le Roi No. 2	4,890
Le Roi No. 2 (concentrated)	2,320
White Bear	255
White Bear (concentrated)	1,200
Total	62,058

The work of sinking the Le Roi main four-compartment shaft below the 1,350 foot level, commenced several months since, is progressing satisfactorily. A depth of 1,650 feet was reached by the end of March, and the contractors were using all expedition in continuing to a deeper level.

The Le Roi Mining Company is operating the Spitzee mine under a working bond with right of purchase. This mine had been idle since 1905, the local company owning it having had no money to pay for further development work. About 6,700 tons of ore in all have been shipped by the Spitzee Mines, Limited.

The 650 horse-power Westinghouse induction motor, installed in the power house of the Consolidated Mining & Smelting Company of Canada's Centre Star mine, to furnish motive power to the 40-drill air compressor instead of steam, was started on April 6th and found to run smoothly. An electric locomotive is now in use at the 350 foot level of the mine, hauling from the War Eagle to the Centre Star main shaft. Goor progress is being made with the installation of the new hoist—a Nordberg engine, cylinders 28 by 60 inches, drums 10 feet, skips 4 1-2 tons—to have a hoisting capacity of 1,350 tons per 10 hours from a depth of 3,000 feet.

BOUNDARY.

The Phœnix Pioneer has published the following ore production statistics for the quarter ended March 31st:—

Month.	Tons.
January	60,003
February	53,965
March	100,219
Total	214,187

The unusual severity of the weather experienced in January and March, and the shortage of railway cars for hauling ore and coke, together with the lack of sufficient fuel for mines and smelters, were accountable for the comparatively small production.

The treatment capacity of the Granby Company's smelter at Grand Forks is now at the maximum the enlargement of its six smaller furnaces was intended to reach. With eight blast furnaces, each having a capacity of about 500 tons per diem, the works are equipped for a larger output of copper than at any previous time since they were established. Should no difficulty arise in connection with labor and fuel supplies, the Granby Company should have a period of renewed profitable operations, mines and smelting works together being equipped for 100,000 to 120,000 tons of ore per month.

At the British Columbia Copper Company's smelter, Greenwood, the third large blast furnace has been completed. Although having a nominal capacity of 600 tons per day, it has been found that the new furnaces will each treat about 700 tons in 24 hours, so that the capacity of the works is fully 2,000 tons of ore per day. At the company's several mines good progress continues to be made. Several levels down to the 400-foot are being extended in the Mother Lode mine. The the Emma, electricity is being supplied for power purposes, the transmission of 40,000 volts from Bomington Falls generating station to the Boundary giving ample power for both mines and smelters of the district. Mr. J. E. McAllister, general manager of the company, has returned from his trip to Europe, his health having been greatly benefitted by the change and rest. Mr. G. F. Beardsley, on the eve of his retiring from temporary charge as acting manager, received from the smelter employees a serviceable gift as a memento of the good feeling existing towards him. Mr. Frederic Keffer, engineer in charge of the company's mines, is also back at his post, after having visited New York at the close of the annual meeting of the Canadian Mining Institute, held early in March.

The Dominion Copper Company is further increasing the equipment of its mines in Phœnix camp. At its smelting works at Boundary Falls the erection of the large blast furnace—the largest copper smelting furnace in Canada—is well forward. The addition of this furnace increases the smelting capacity of these works to between 1,400 and 1,500 tons per day. Mr. Thos. R. Drummond, the company's general manager, has gone to Cobalt in the capacity of assistant general manager of the Nipissing Company's mines. His place in the Boundary has been filled, it is stated, by the appointment of Mr. W. C. Thomas to the charge of the Dominion Copper Company's mines as well as its smelter, of which latter he has been in charge since the inception of operations under the present regime.

GENERAL MINING NEWS

British Columbia.

The Cariboo-McKinney Mine is being unwatered, preparatory to the resumption of mining operations.

A total of eight furnaces will soon be in blast at the plant of the Granby Consolidated.

In the Ainsworth camp mining is reviving briskly. The Krao main shaft is down 200 feet, and all the workings are reported in good ore.

The Boundary Falls smelter employees, by a new wage scale, will get about $1,000 more per month than hitherto.

The chief demands of the Western coal miners are: A wage increase of 10 per cent. all around; fortnightly pay. Bank-to-bank eight-hour day for Alberta.

It is probable that a Canadian Mine Workers' Organization will be formed, which will be entirely distinct from the United Mine Workers of the United States.

Large additions are being made to the plant of the Vancouver Portland Cement Company in Tod Inlet, B.C.

At a mass meeting of the miners of Coal Creek and Fernie, held at Fernie on April 11th, it was decided by a referendum vote of 741 to 42 to stop work unless the operators conceded there demands.

At the Cariboo-McKinney, unwatering has been carried on to the 400-foot level.

The smelter of the Dominion Copper Company established a new week's record. For the week ending April 13th it smelted 5,344 tons of ore.

Ontario—Cobalt.

The Government has decided to create two new mining divisions. These will be known as the Lady Evelyn Lake and Montreal River district, and the Larder Lake district. Recording offices will be established in each.

The International Coal & Coke Company, of Coleman, Alberta, has declared its second oneper cent. dividend, amounting to about $28,000, payable May 1st.

New Brunswick.

A man named Luunder Crossman was killed at the Intercolonial Copper Mines, Dorchester, N.S., by a premature explosion of dynamite.

Nova Scotia.

Torbrook.—The Leckie vein, to recover which systematic prospecting has been carried on for some time by Mr. W. F. C. Parsons, the mining engineer of the Londonderry Iron & Mining Company, was uncovered early in April at a point about 2,200 feet west of the Wheelock shaft. The vein here was 6 1-2 feet wide. It has since been traced east and west of No. 1 pit for a distanc of over one-quarter of a mile. The average width of vein on surface is 6 feet of clean ore between walls. The dip is about 80 degrees. The following is an analysis of an average sample, taken from half a dozen test pits:—Iron, 54.06 per cent.; silica, 13.10 per cent.; phosphorus, 0.86 per cent.; manganese, 0.14 per cent.; sulphur, 0.12 per cent.; alumina, 4.42 per cent.; lime, 1.86 per cent.; magnesia, 0.32 per cent. Assuming that this vein continues to the depth of the present workings, this already proved ground will yield 800,000 tons of ore. The ore can be put on cars at the mine for 75 cents per ton.

Over 4,000 tons of coal was raised in one day, April 12th, at the Reserve Mines Colliery, N.S.

The Dominion Coal Company will this season have the largest fleet of steamers that they have even put into commission. Their total carrying capacity is 106,650 tons.

MEN AND MATTERS

Capt. T. H. Trethewey has retired from the management of The La Plata Mines, B.C. He will remain on the board, however; therefore the company will not be entirely without his services. The Captain has other mining interests that require his personal attention. He has been succeeded by his son, W. J., who assumed charge April 1st. The mine is producing and making regular shipments to the Trail smelter.

Mr. Ralph Stokes, late mining editor of *The Rand Daily Mail*, Johannesburg, is now commencing a tour of the chief mining fields of Canada as the special correspondent of *The Mining World*, Chicago, and *Rand Daily Mail*, Johannesburg, and as an occasional contributor to the London *Financial Times*. His journey will comprise the last section of an extensive tour through the British Empire. Leaving the Rand in January last year, Mr. Stokes has since visited and reported upon the Ceylon (gems and graphite), Indian (mica and manganese), Malay States (tin), Kalgoorlie (gold), Broken Hill (silver, lead, zinc), Bendigo (gold), Mt. Lyell (copper), Tasmanian gold, Mt. Bischoff, Briseis, Anchor, etc. (tin), Zeehan (silver, lead), and Waihi, New Zeland (gold) mining districts. His Canadian journey will include the Rossland, Trail, Sudbury, Cobalt and Thetford fields.

Mr. W. C. Thomas, smelter superintendent of the Dominion Copper Company, has been promoted to the position of general local manager of the company. Mr. Thomas will have charge of both the smelting and the mining operations.

The citizens of Parry Sound have passed a by-law authorizing the giving of a bonus of $100,000 to the Dominion Smelters Limited, to assist in the erection of a $1,500,000 custom smelter. The smelter will have a capacity of 1,000 tons of ore daily.

Mr. Fritz Cirkel, mining engineer, of Montreal, is at present in the asbestos region of the Eastern Townships of Quebec, examining a large tract of recently discovered asbestos ground on behalf of Qeubec capitalists.

Mr. R. R. Hedley, for many years smelter manager of the Holt Mining & Smelting Company at Nelson, B.C., and who recently resigned that post, is at present visiting Montreal and other Eastern cities, renewing old acquaintances formed during his connection with the Orford Copper Company, some twenty years ago.

Dr. A. E. Barlow returned to Ottawa on the 12th inst., after spending a very enjoyable two months on business and pleasure in Europe.

Mr. W. Stanley Lecky, head of Messrs. Mussens Limited mining department, was married on the 3rd inst. to Miss Mary Theresa Perram, of Buffalo, N.Y. Mr. and Mrs. Lecky are spending their honeymoon in England.

Mr. R. A. Daly, who for some years past has been engaged in the survey of the international boundary, along the 49th parallel in Southern British Columbia, in connection with the work of the Geological Survey and the Boundary Commission, has resigned his post and accepted a chair of Geology at Harvard University. Mr. Daly will reside at Cambridge, Mass., in future.

The Cobalt Townsite Company which owns thirty-seven acres directly south of Cobalt, made its first shipment early in April. A six-drill compressor is running on this property.

The Jury Copper Mines, Limited, recently installed a boiler and hoist upon the copper property which they are developing.

The Herminia Copper Mining Company, near Massey Station, are reported to be considering the erection of a copper smelter at Thessalon.

The Ontario Government has received a cheque for about $40,000, being part payment of royalty from the O'Brien mine on nine car loads of ore shipped during the first three months of this year.

Port Arthur.—The prospects of opening up several of the famous old silver mines of this district are good. The West End Silver Mountain is reported to be in satisfactory operation. The Beaver, the Badger, the Porcupine, the Rabbit Mountain, and the Shuniah Wickean or East End Mine, it is stated, will all be reopened. We hope and believe that this will mark an era of added prosperity in Western Ontario.

On or about the first of May the Atikokan mines will commence shipping iron ore to the Port Arthur blast furnace. It is expected that 200 tons per day will be shipped.

It is expected that 100,000 tons of ore will be shipped from the Loon Lake iron mines this season. They have been purchased by the Canadian Bessemer Ore Company. The ore is to be crushed and put over Hancock jigs for concentration.

The merger of La Rose, University and several other mines is reported. Messrs. John W. Martin, Timmins and Dunlop are behind the new promotion. It is announced that the capitalization will be $6,000,000. The new company will take the name of La Rose.

An official report announces that at a depth of 75 feet an eight inch vein of smaltite has been struck in the Foster workings. This is decidedly encouraging. Superintendent Alder is to be congratulated.

Under the recent decision of the Supreme Court, which settles the litigation over the Lawson Mine, Mr. John McMartin becomes owner of three-quarters of the mine. Messrs. Millar and Clarke and their associates get one-quarter.

ALBERTA.

On April 3rd an explosion of gas in the mines of the International Coal & Cofle Company, Coleman, resulted in the death of three men.

Mr. A. B. Willmott has resigned his position with the Lake Superior Corporation and is taking up private practice. He will continue to act as consulting geologist for the above company, and will establish in Sault Ste. Marie, Ont. As a mining geologist, Mr. Willmott has had a long and valuable experience, and has done much towards the development of New Ontario.

Mr. A. A. Hayward, past president of the Nova Scotia Mining Society, is in Toronto. Mr. Hayward is a gold miner of prominence in Nova Scotia. During his term of office as president he infused new life into the Mining Society.

DIVIDENDS

The Consolidated Mining and Smelting Co. of Canada, Limited
Dividend No. 5

Notice is given that a dividend of two and one-half per cent. (2 1-2 per cent.) on the paid-up capital stock of the company for the quarter ending March 31st, 1907, has been declared, payable May 1st, 1907, to holders of full shares of the said company of record on the 22nd day of April instant.

Buffalo, Cobalt—Capital, $1,000,000; last dividend paid April 1st, 1907, $30,000.

Granby Consolidated, B.C.—Capital, $15,000; last dividend paid, March 30th, 1907, $405,000.

McKinley-Darragh, Cobalt—Capital, $2,500,000; last dividend paid, March 1st, 1907, $50,000.

Nipissing, Cobalt—Capital, $6,000,000; last dividend paid, April 20th, 1907, $180,000.

Trethewey, Cobalt—Capital, $1,000,000; last dividend paid, March 31st, 1907, $40,000.

International Nickel—Capital, $12,000,000; last dividend paid, May 1st, 1907, $121,123.

Nova Scotia Steel & Coal—Last dividend paid, April 15th, 1907, $74,555.

The limestones near St. John, N.B., are in places highly serpentinous and have furnished indications of the presence of Eozöon. At Pisarinco, however, serpentine is seen to cut talcose and chloritic rocks, associated with limestones, as a true dyke six feet wide. At the falls of the St. John River, also, deposits of plumbago of large extent are found in the slates and limestones.

BOOK REVIEWS

"Hydro-Metallurgy of Silver," by Ottokar Hofmann, Hill publishing Company, New York and London, 1907, $4.00, postpaid.

Mr. Hofmann's long experience in this branch of metallurgy has amply qualified him to produce an authoritative text-book. Mr. Hofmann was the first to introduce the process of lixiviation with sodium hyposulphite in Mexico (1868). Experience gained with different ores induced him to modify the chloridizing roast with the object of decreasing the loss of silver by volatilization. This was a marked improvement in the treatment of silver ores.

The book is divided into two sections; the first takes up "Chloridizing Roasting of Silver Ores"; the second deals with the "Extraction of the Silver."

There is a popular dictum that a text-book is usually ten years behind modern practice. Mr. Hofmann's book gives the lie to this. "Hydro-Metallurgy of Silver" is well compiled, well illustrated and well printed, and gives us the last word in metallurgical progress.

"The Principles of Copper Smelting," by Edward Dyer Peters, Professor of Metallurgy Harvard University. Pages, 612. Price, $5.00, postpaid. The Hill Publishing Company, 505 Pearl street, New York.

This new book of Professor Peters' is to be distinguished from his standard work on "Modern Copper Smelting." The latter book deals with the methods of smelting, the former is a lucid, exhaustive and reliable exposition of the principles underlying the actual operation. "The book is written, in part, for students," says Professor Peters in his preface, "and, as there are many persons who would like to gain some insight into the smelting of copper, but who have not the training which is requisite for the understanding of ordinary metallurgical treatises, I have tried to write in such a manner that it might be reasonably intelligible to those who have no exact knowledge of chemistry."

In this aim the author has succeeded. The book is clearly written. In style it is clear. In diction it is neither cumbrous nor hyper-technical; and this can be predicated of very few text-books dealing with such subjects. The arrangement is logical. Chapter VIII., on Pyrite Smelting, and Chapter IX., on Slags, are particularly valuable. That our praise may be slightly diluted by the cold water of criticism, we may suggest that a larger number of diagrams and illustrations would not detract from the appearance of the volume. This, however, is incidental. Professor Peters' new book is worthy of immediate adoption by educationists and technical workers. Would that some equally well-equipped writer would give us as full a treatise on the principles of modern iron smelting.

METAL, ORE AND MINERAL MARKET

Aluminium—For No. 1 ingots, 48 to 50 cents per lb.
Antimony.—Market dull; 21 to 21 1-2 cents per lb.
Arsenic, white—7 1-2 to 8 cents per lb.
Barytes, crude—$11.25 to $14.50 per ton.
Bismuth—$1.40 to $1.50 per lb.
Cadmium—$1.40 to $1.46 per lb.
Carbons, for drill—$75.00 to $85.00 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, pure metal—80 cents per lb.
Cobalt—F.o.b. Cobalt, Ont., unrefined, 40 cents per lb.
Corundum—7 cents per lb.
Feldspar—$10.00 per short ton.
Fluorspar, lump—$9.00 per short ton.
Graphite, domestic—$45.00 to $150.00 per short ton.
Gypsum, lump—$4 per ton.
Infusorial earth, ground—$15.00 to $30.00 per ton.
Manganese, pure—75 cents per lb.
Mica, ground—$62.00 to $85.00 per short ton. Scrap—$12.00 to $15.00 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 95 per cent. pure—21 cents per lb.
Nickel—45 cents to 50 cents per lb.
Platinum, ordinary metal—$33.50 per ounce.
Pyrite, 38 per cent. to 45 per cent. sulphur—11 cents per lb.
Quicksilver—$42 per flask of 75 lbs.
Talc—$17.00 per ton.
Tungsten, pure metal—$1.32 per lb.
Tungsten ore, 60 per cent. pure—$400 per ton.
Tin—40 3-4 cents per lb.
Zinc sheets—$8.60 per 100 lbs.

ENGLISH ORES AND METALS MARKET

Compiled from James Lewis & Son's Monthly Report.

Copper—Standard, per ton, £97; best selected ingots, per ton, £109; ore, per unit (20 cwts.), 19s.

Silver has fallen from 32 1-6d. to 30 1-2d. per ounce; standard.

Quicksilver—£7 per bottle.

Lead is steady at £19 10s. to £19 15s. for English.

Antimony is steady, £98 to £100 per ton.

Nickel—1s. 9d. to 2s. per lb. net.

Cobalt, refined—9s. 9d. per lb.

Tin falls to £185 10s. cash per ton.

Bank rate of discount remains at 5 per cent.

EXCHANGES

The Mining World, April 13th, continues Horace Evans' "Explorations in British Columbia." "Endless Rope Haulage" is an excellent article.

"The Mines of the Fairview District, Nevada," are well described in The Eng. and Min. Journal, of April 13th.

The Mining Reporter, April 11th, contains a profitable epitome of chemical literature.

"Gas, Gas Engines, and Gas Producers," is a leading article in The Canadian Electrical News for April.

Cana, for April 6th, has been received. It devotes a page to mining matters.

The Mining and Scientific Press, of April 6th, has a very brisk editorial on "Salting Samples." The third installment of "How the Miner's Dynamite is Made" is eminently worthy of perusal.

South African Mines, March 16th, affords its usual comprehensive summary of mining operations in the Rand, Rhodesia, and other South African mining countries.

In the Journal of the Chemical, Metallurgical and Mining Society of South Africa for February, Dr. James Moir deals somewhat severely with The London Mining Journal. Discussion following the reading of a paper on "Witwatersrand Mine Air" leads to a lively embroglio between Dr. Muir and The Mining Journal—pre-eminently not "*sans phrase.*" Dr. Moir, in terms by no means tender, states that our estimable contemporary is not up-to-date in its technical information.

The Mining Investor, April 15th, compliments the United States Post-office Department upon its good work in suppressing fraudulent mining promotions. It also reprints the abstract of Professor Van Hise's paper on "Cobalt," which appeared in a recent number of THE CANADIAN MINING JOURNAL.

A statistical summary of "The British Open-Hearth Steel Industry in 1906" is given in the April 5th number of The Iron and Coal Trades Review.

In The Mining Journal London, an account of the Royal School of Mines' thirty-fourth annual dinner of old students is illustrated by a full page photogravure. The "Report of the Commission on Gold Stealing in Western Australia" is the subject of the leading editorial.

The Engineering Journal of Canada, April, has been received.

The Colliery Guardian, April 5th, continues "Evidence Taken before the Royal Commission on Mines."

Stone, for April, has been received.

In The Engineering and Mining Journal, April 13th, an electric winding plant at a German colliery is described. A portrait and biographical sketch of Mr. George Otis Smith, the new Director of the United States Geological Survey appears also in this number.

The Mining World, April 20th, gives a very readable account of the "Eocene Gold-bearing Gravels of Colombia."

CATALOGUES AND OTHER PUBLICATIONS

Portable oil well rigs, for drilling deep oil, gas and water wells, are described in a large catalogue (No. 3, 1907, second edition), sent out by the Keystone Driller Company, Beaver Falls, Pa.

Catalogue No. 2, "The Samson Crusher," 1734 Fifteenth street, Denver, Col., illustrates the Samson crusher. This is a uniform crushing type, which will not choke, and is economical of power. From the same address comes a circular giving a description of the Ajax Drill Sharpener, which sharpens 1,200 drills in 24 hours.

The February number of Mine and Quarry has been received. This is a very attractive quarterly bulletin, issued by the Sullivan Machinery Company, Railway Exchange Building, Chicago. The bulletin is published in magazine form, is well illustrated and gives information that is of real value.

A catalogue of coal mining machinery, sent out by the Morgan-Garner Electric Company, of 27th street and Shields avenue, Chicago, gives illustrations of their electric coal cutters, drills, generators, locomotives, etc.

Conveying and Transmission is a monthly publication devoted to methods for the mechanical handling of materials and transmission of power, published by Stephens-Adamson Manufacturing Company, Aurora, Ill. Canadian sales agents, Mussens Limited, Montreal.

From Fried Krupp, Grusonwerk, Magdeburg-Buckau, comes the announcement that a separate metallurgical department has been established at their works for the manufacturing of furnaces, machines and apparatus, as well as complete installations for the recovering of metals from ores and for the designing of plants for metallurgical treatment of lead and zinc dust, waste products, and for the concentration of refractory ores.

We acknowledge receipt of Circulars No. 1028 and No. 1067 from the Canadian Westinghouse Company, Limited. They deal with rotary converters and air blast transformers, respectively.

The "Carbogen" Oil Fuel Burner, manufactured by J. A. Curle, Limited, Homer-road, South Hackney, England, is designed to consume cheap and crude by-products and ordinary heavy oil. The "Carbogen" is lighted with extreme ease, and is an extraordinarily efficient steam raiser. For a full description we would refer our readers to The Engineer of February 15th, 1907. Mr. F. Sturgeon, 32 Church street, Toronto, is the sole agent for Canada. Mr. Sturgeon is also agent for the Anglo-Swedish Steel Company's mining and tool steels.

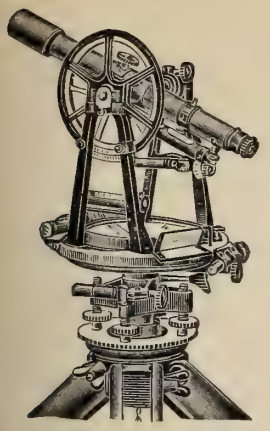
STATISTICS AND RETURNS

Shipments of ore in various British Columbia mining districts for the week end April 13th were as follows:—

	Tons.
Boundary	29,252
Rossland	4,204
Kootenay-Slocan	2,474
Total	36,530

The smelter receipts for the same period are:—

	Tons.
Granby	17,840
British Columbia Copper Company	5,911
Dominion Copper Company	5,344
Trail smelter	4,790
Hall Mines smelter	138
Le Roi smelter	1,467
Marysville smelter	600
Total	36,090



Cobalt Ore Statement,—Week Ending April 13th, 1907

Kerr Lake shipped 40,000 lbs. to Perth Amboy on April 8th.
Coniagas shipped 42,520 lbs. to Perth Amboy on April 10th.
Coniagas shipped 57,140 lbs. to Copper Cliff on April 10th.
O'Brien shipped 66,000 lbs. to Copper Cliff on April 13th.
Total—245,660 lbs.

The ore shipments through Kaslo for March show a big increase over the previous month and a large gain over the corresponding period of last year. Thirty-four car loads, totalling 632 tons, were shipped during March, against 156 in February. For the corresponding period of last year 401 tons, a gain of 231. This includes silver-lead, carbonates and zinc. The principal shippers were the Whitewater Deep and the Last Chance, as the following table will show:

	Tons.
Last Chance, silver-lead	104
Last Chance, zinc	27
Colonial, carbonates	49
Sunset, silver-lead	43
Whitewater, silver-lead	54
Whitewater Deep, silver-lead	143
Whitewater Deep, zinc	192
Bismarck, carbonates	20
Total tons	632

WANTED—A mine manager who has had 20 years' experience in gold and silver mine management wishes to correspond with any mine owner in or near Cobalt, with a view to securing a responsible position in that district. The advertiser has had an especially valuable training in rapid shaft sinking and general development work. Address A. A. A., care of this Journal.

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

An enlarged copy of this very complete pocket map of Cobalt will be obtainable after the first week of May. Orders will be received at the office of THE CANADIAN MINING JOURNAL. The map will also be offered for sale at all news stands. The geology of Cobalt Camp will be plainly and exactly indicated in colors. The very latest authoritative data have been used for this purpose. The map, although conveniently small, is comprehensive, clear, accurate and legible. It has been compiled at great expense and pains. It is, in fact, a remarkable piece of work, and THE CANADIAN MINING JOURNAL is glad of the opportunity of supplying the phenomenal demand which has arisen for a reliable map of Cobalt. The price is ONE DOLLAR.

UNDERWOOD

¶ If you use a typewriter, use the best. It is economy—economy of time, of money, of labor.

¶ **The Underwood is the BEST Typewriter.** That is a claim made for every typewriter, but the Underwood has the advantage of being able to "deliver the goods."

¶ It has won the Championship of the World in **eight successive contests.** Here is the list:

Chicago, March, 1906, 3 events.
Chicago, March, 1907, 2 events.
New York, Nov., 1906, 2 events.
Boston, March, 1907, 1 event.

If you use a Typewriter USE THE BEST.

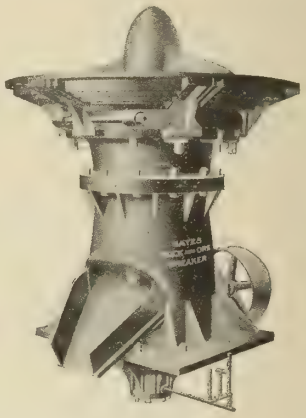
ASBESTOS FROM QUEBEC

EVERYTHING IN MINING

Purchasers may avoid the delays inevitable in dealing with half-a-dozen companies for different portions of their equipment and obtain better value by purchasing their entire equipment from One Company.



The "Lidgerwood" combined friction drum and brake and reversible link motion hoisting engine is the most economical yet made for mine hoisting.

Three of our 600 h.p. Induction Motors driving blowing engines at the Canadian Copper Co., Copper Cliff. This type of motor is specially adapted for all mining operations.

This is a view of three of our Ingersoll steam drills engaged in rock excavation

Gates "K" Rock and Ore Breaker will break more per horse power than any other ever built.

Port Hood Coal Is The Best House Coal In Canada

We can say, without fear of successful contradiction, that the coal now being mined by us at Port Hood is equal to or better than any now being mined in this Province. It is meeting with general approval from **dealers, consumers and manufacturers.** All who are open to make contracts for Summer or Winter delivery should write us for special terms at once. "New and powerful tug boat to attend to all vessels." Deliveries effected by large or small steamers, or via rail.

Complete Asbestos Mining and Milling Plants

Birdseye View of Asbestos & Asbectic Co's Plant at Asbestos, Richmond County, Quebec.

¶ In the counties of Megantic, Richmond, Beauce, and Wolfe, comprised in the Eastern Townships of the Province of Quebec, the bulk of the world's supply of Asbestos is mined.

¶ Ten large companies are at present in operation, some of them dating back twenty years or more, and two others will be added to the number this summer.

¶ Our Sherbrooke works are located in close proximity to the Asbestos region and, with one exception, we have equipped every plant, virtually complete. In the case of the one exception, part of the equipment is our manufacture, and we are at present building the machinery for the two new plants referred to.

¶ We are consequently in the best possible position to furnish machinery for mining and dressing Asbestos Ore, and invite enquiries from interested parties.

¶ Estimates for complete plants furnished on request.

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and in Europe is invited to the

Great Mineral Territory

Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of Mining.

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved, whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such licenses the first right to purchase the mines. In the case of lands where the surface alone is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

Mining for superior metals on lands situate more than 12 miles from a railway in operation, $5.00 per acre, and on lands situate less than 12 miles from such a railway, $10.00 per acre;

Mining for inferior metals—the price and the area of the concessions are fixed by the Lieutenant-Governor in council.

The words "superior metals" include the ores of gold, silver, lead, copper, nickel, and also graphite, asbestos and phosphate of lime; and the words "inferior metals" mean and include all the minerals and ores not included in the foregoing definition and which are of appreciable value.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within the two years.

Mining licenses, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $5.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts. The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Grand Trunk Pacific Railway will run.

The government has made special arrangements with Mr. MILTON L. HERSEY, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines at Quebec, under the direction of the Superintendent of Mines, will give all the information asked for in connection with the mines of the Province of Quebec, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec

The Book can be seen and obtained at the Offices of this paper.

Now Ready. **Published March 21.** **21st Year.**

Twenty-First Year. Established in 1887

The Mining Manual

For 1907

By WALTER R. SKINNER

Contains all the latest information up to within a few days of publication. The Standard Reference Work on Mines. 1,600 pages. In demy 8vo, cloth. Price 21/-, post free.

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1907 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

THE REASON WHY

The enlarged diagram above tells the story.

If you examine it you will notice that it is composed of five different layers.

In fact, Amatite is made on a different principle from any other roofing. Instead of a smooth skin coating *made to receive a coat of paint*, Amatite has a rough surface of small particles of hard silicious rock such as seen in quartz or other hard stone when examined under a microscope.

This mineral surface is chosen for its weather-resisting qualities, and does away *absolutely* with *painting* and *coating*.

Underneath the mineral surface are alternate layers of long-fibre, wool-stock felt of the best grade, and between each sheet and under the mineral surface on the top is a layer of a specially prepared Coal Tar Pitch, *the greatest waterproofing material known*.

This short description will give you some idea of how carefully Amatite is constructed and what effective protection it will give against weather of all kinds.

FREE SAMPLE

The best proof, however, is to see a Sample, which we will send to any one free upon receipt of name and address. Write to nearest office.

COPPER

In his presidential address before the Institution of Mining and Metallurgy at the recent annual meeting, Prof. W. Gowland paid particular attention to the advances in copper smelting in late years. After pointing out that Great Britain, which, during the first half of last century, was the chief producer of copper in the world, gradually lost that position, owing first to the discovery of important deposits in Chili, later in the United States, and to the decreases in the output of the Cornish mines, the speaker proceeded to say that the present enormous output of the metal would have been quite impossible with the old methods, furnaces and appliances, some of which still survive in Continental Europe and in Great Britain. The extraordinary development of the copper industry is due chiefly to the remarkable increase in the size and capacity of furnaces; the application of the Bessemer process to copper mattes; the introduction of pyritic smelting; the general reduction in the costs of production; and last, but not least, the removal of the chief producing centres from the old world to the new. In Prof. Gowland's opinion advances as great, or perhaps greater, then those of the last fifty years will be made before the end of the next half century, probably, in part, in the following directions:—

(*a*) The extended application of producer gas as fuel in copper reverberatory furnaces. This would, he felt sure, be found to be specially efficatious with large furnaces, such as those of the Anaconda Company. Gas could be admitted at several points in their sides, and so secure a uniformly high temperature throughout their length.

(*b*) The introduction of the tilting furnace of the open-hearth steel manufacturer into the copper refinery. A movement in this direction has already been made at the Tacoma Refinery, Puget Sound, but oil and not gas is used as fuel.

(*c*) The extended adaptation of the Bessemer converter to the treatment of poor copper matte, etc. Even now, with a basic lining and the addition of silicious ores of value to the charge, a certain amount of success has been attained in this direction, but this is only an earnest of what may ultimately be reached.

(*d*) The roasting of cupriferous pyritic ores in cast iron vessels with a blast and additions of silica or lime.

(*e*) The utilization of the sulphur dioxide from the poor gases from calcining and roasting plants for the manufacture of sulphuric acid by a "contact" process.

(*f*) Lastly, but by no means least, the electric smelting of copper where water power for generating electricity can be obtained at small cost. This process at present, however, has not passed out of the experimental stage.

THE WESTERN COAL STRIKE

A satisfactory settlement has been reached at last. On May 6th Deputy Minister of Labor Mr. W. L. Mackenzie King announced in an official telegram to his Department in Ottawa, that, as a result of concilation proceedings, an agreement had been signed and the miners would resume work on the morrow.

By the terms of the agreement the men receive a five per cent. increase in wages and an eight-hour day from bank to bank. Other substantial concessions are made. It is agreed that if, in case of dispute, the difficulty is not settled by the first camp board, there shall be an immediate appeal to a board of arbitrators, whose chairman shall be named by the Minister of Labor. The agreement stands for two years, and provision is made for a meeting of operators and representatives of the union, sixty days before its expiry, for the purpose of arranging a renewal of the agreement.

If during this protracted struggle the men had remained at work, pending the action of the Board of Conciliation, they would have deserved in full measure public sympathy and support. In stopping work they took a step that entailed heavy loss to the industries depending upon a regular supply of fuel. For this they have no excuse. It is fatuous to affirm that this was done without the sanction of the Executive of the United Mine Workers. The stoppage of work was the result of concerted action by the members of the union, and this the public must remember, should disputes arise at any future time.

Mr. Mackenzie King appears to have performed his delicate task with skill and tact. The peculiar difficulties of the situation tested the new Labor Act very thoroughly. That a settlement has been reached peacefully reflects credit upon the Department of Labor, as represented by Mr. King, upon the operators and, in a much less degree, upon the miners themselves.

TO THE PUBLIC

A persistent attempt is being made to boom the Larder Lake district. In view of the prestige attaching to mining in Ontario because of Cobalt's great showing, it is not unlikely that many small investors will be induced to risk their money in one or other of the extravagantly advertised concerns which have been recently floated. At present, although something like four thousand locations have been staked out in the district, no development work of importance has been done and consequently the only foundations for the assumption that the area is a rich one are the newspaper reports of valuable finds and the publication of assay returns in prospectuses, which may mean anything or nothing. As a sample of the absurdities now being published by the daily press, we cut the following from a Montreal evening paper:—

"One prominent mining man of large experience in the different gold camps of the world, after visiting the camp, stated this could hardly be termed a mining camp at all, that it more nearly resembled a large manufacturing industry, with sufficient raw material on hand to run for centuries. The question, in his opinion, was simply one of the capacity of the machinery, and the amount of gold bars turned out would be limited only by the size of the plant for treating the ore."

How men of ordinary intelligence can possibly be influenced by such obvious nonsense as this baffles explanation. And yet the fact remains that it is just this sort of thing that the public will swallow without so much as winking.

AMERICAN INSTITUTE OF MINING ENGINEERS

The American Institute of Mining Engineers held its regular spring meeting in the auditorium of the new United Engineering Building on April 18th and 19th. Dr. Rossiter W. Raymond, the veteran secretary of the Institute, was called upon to speak by the President of the Council, Mr. John Hays Hammond. Dr. Raymond touched lightly on the history of the organization. He referred to the fact that for more than thirty years the Institute was not incorporated, nor had it settled headquarters. Any attempt to place it at one spot would simply have been a signal for the appearance of other local societies in other spots. There had been a time when Philadelphia, as the capital of a mining State, had strong claims to become the headquarters of the Institute. The establishment of a rival Institute in the West or of other national societies for iron, coal and steel had been projected at various times. But through all this troublous period the Institute, by being peripatetic, had kept itself national.

Dr. Raymond spoke in most glowingly laudatory terms of the work of Mr. Henry G. Morse, the junior member of the firm of architects who erected the building.

THE BUSINESS OF MINING

We wish to draw especial attention to an article which appears in this issue. It is entitled "Requirements of Modern Mining," and is reprinted from our contemporary, the *Mining and Scientific Press,* of San Francisco. We had intended commencing a series of articles defining and describing the *business* and profession of mining. This article covers so succinctly and so forcibly the whole subject that it deserves the most careful perusal. Taking it as a text, we shall attempt, in succeeding issues, to demonstrate how little the great majority of alleged "mining" schemes have to do with the legitimate business of mining. We most emphatically disclaim any intention of injuring individual mining camps. But, unfortunately, one or two of our otherwise promising districts have been made the hatching places of utterly extravagant schemes. If, in attacking these promotions, we cause incidental hardships to the mining districts involved, we shall be sorry—but it cannot be helped.

EDITORIAL NOTES

The recent readjustment of postal rates between Canada and the United States has forced THE CANADIAN MINING JOURNAL to raise its subscription rate from two dollars to three dollars. This applies only to new subscribers in the United States. American subscibers who have already sent in their subscriptions for the amount of two dollars will not be called upon to increase that amount until next year. But THE CANADIAN MINING JOURNAL could not continue to supply subscribers on the other side of the line at the two dollar rate without incurring considerable loss.

Although the production of nickel ore in New Caledonia showed a slight increase last year, as compared with 1905, the outlook for the industry in that colony does not appear to be very bright. As a result of the new mining law, which came into force in July last, thousands of acres of mining lands have been abandoned. This law compels the owners of mining lands to either continuously work the properties or else pay a double rental. A consular reports notes that this is tantamount to forcing production on a limited market, and as the whole of the nickel produced in New Caledonia is virtually the product of about eight of nine mines, the consequence of trying to force production on the world's markets is disastrous in the extreme, since, under fair conditions, it would be easily possible to double the present output. The total area of the mines abandoned during December, 1906, was 42,500 acres, and this will be exceeded during 1907 if the present restrictions are maintained.

The Rev. Dr. Robert Falconer has been appointed to the presidency of Toronto University. The choice is a fortunate one. Dr. Falconer is young and vigorous. He is an accomplished scholar and a successful educationist. The Provincial Government has displayed foresight and discretion in endowing the new president with large powers. Incidentally it is pleasant to note that the salary now attached to the office bears some proportion to the dignity and responsibility of such a high position.

Queen's University, recognizing the value of Provincial Geologist Wilbert G. Miller's services, has conferred upon him the honorary degree of Doctor of Laws. We sincerely congratulate Dr. Miller. We also congratulate Queen's upon being the first public educational institution to tangibly express its appreciation of Dr. Miller's unique and far-reaching work in developing the mineral wealth of Ontario.

British Columbia papers, in noting the fact that several of Cobalt's mine managers have been engaged from British Columbia camps, felicitate their Province upon possessing a superior class of mining engineers and miners. This is doubtless the case. But we would remind Cobalt that, should her demand for men remain unsatisfied, Nova Scotia also produces miners trained by long experience in metalliferous mines. With both British Columbia and Nova Scotia to draw on, and our mining schools turning out dozens of young graduates, we should depend in a constantly lessening degree upon talent imported from the United States.

ASBESTOS

(Written for THE CANADIAN MINING JOURNAL.)

It is not intended in this article to go into the geology of the rocks or the history of the serpentines in the Quebec asbestos belt of the Province of Quebec, as the subject has been taken up from time to time in the last 30 years by many well-known geologists of this and other countries, and many interesting articles have been written by such eminent geologists as Dr. Dawson, Prof. Logan, the late Dr. Sterry Hunt, and others.

CARD ROOM—SHOWING PROCESS OF CARDING.

DRAWING ROOM—SHOWING PROCESS OF DRAWING AND DOUBLING AND COMBING.

It is of the commercial aspects and general information of the asbestos industry that we intend to treat in this

article, in such a manner that the lay mind may appreciate the importance of one of Canada's most useful mineral industries, one of which perhaps, less is known than of any other. This is probably due to the fact that very little speculation has ever taken place in the properties themselves, and very few, if any, stocks have been offered upon the market, of really first-class working propositions. The owners of asbestos properties as a rule have felt that the asset was sufficiently good to keep for themselves, with the result that the mines are generally owned by individuals or small companies.

Asbestos has been mined in Canada for the last 35 years, but for probably 45 years the mineral was known to exist in the Thetford district, in the Province of Quebec. Asbestos has been known almost as far back as we can trace history, for we know of the wrappings of ancient Egyptian mummies that date back at least 2,000 were apparently made of fine hand-woven asbestos cloth, which no doubt came from the old Italian workings—the same that are occasionally worked from time to time in our present day, although little or nothing is being done in the mines in Italy at present.

Asbestos has also been known for many years in Russian Siberia, and to-day is being successfully worked in years B.C., and we know that parts of the wrappings that country. Most of the Russian products are shipped to the markets of Europe. When the Russian deposits were first discovered the working was comparatively easy, as the asbestos was found in ridges of decomposed serpentine, which readily yielded to the pick and shovel; but, as these ridges were worked down the formation of harder serpentine presented itself, so that they are to-day using practically the same methods as are in use in Canadian mines. The material of the Siberian mines, however, is of a coarser grain and does not lend itself readily to the making of textiles or the finer grades of asbestos goods, and the distance of the mines from railway or water routes, even with the advantages of low wages, is not likely to permit it to become an active competitor of the Canadian article in America or Eastern Europe.

Uses.

The variety of uses to which asbestos has been put are unlimited, and new uses are daily found for it. All kinds of textiles in the shape of cloths for many different uses, such as stage curtains, firemen's clothing, fireproof gloves, fireproof hose, and so forth, are manufactured from it. The same textiles, when treated with a rubber solution, make an article that is absolutely waterproof. This is used for steam packings and numerous other purposes where the mixture of rubber and asbestos can be succesfully employed. For electrical uses, such as the insulation of wire, on account of its fireproof quanities, it is of extreme value. It is also used for cut-outs, fuses, switchboards, etc., etc. Immense quantities of it are manufactured into paper of different thicknesses up to three-quarter inch. It is used between floors and walls for deadening sound and prevention of vermin, and recently the Keasby & Mattison Company, of Ambler, Pa., the owners of the Bell Asbestos Mines, have manufactured roofing slates from asbestos, which have proven one of the most valuable and attractive articles that have probably yet been made. These slates are made in different colors, the three principal being slate color, grayish-white (or natural asbestos color), and terra cotta; which give a very pleasing effect for the roofing and sides of houses and buildings.

No. 2 DRIFT, 180 FEET TO RIGHT OF MAIN TUNNEL, BELL ASBESTOS MINE, THETFORD, P.Q.

They also manufacture corrugated and plain building lumber, in sheets from 2 feet to 4 feet wide by 4 feet to 8 feet in length.

HIGHEST GRADE CRUDE ASBESTOS ORE.

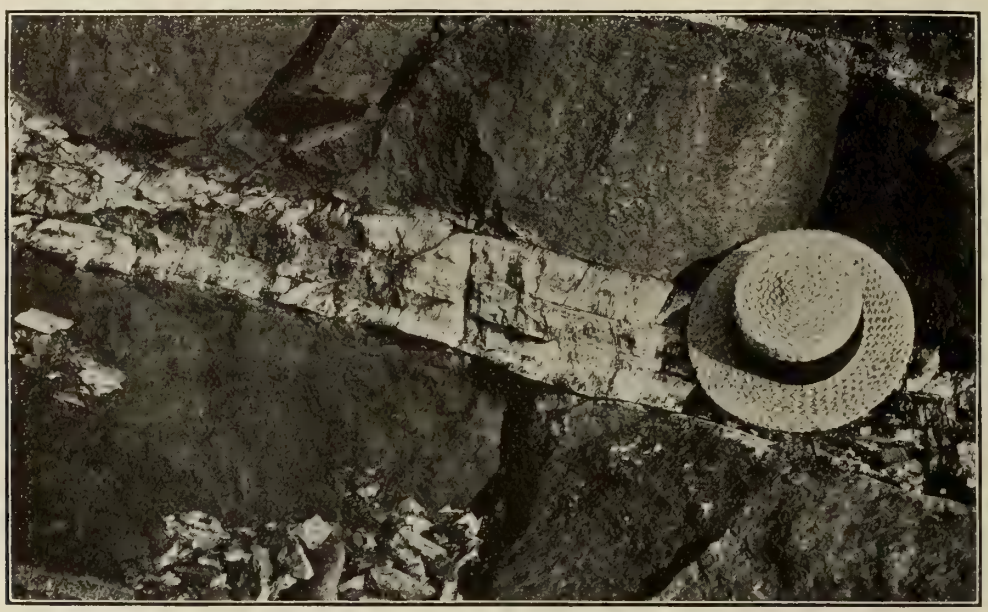
These latter can be given in any dimensions asked for, and the material is readily handled by any ordinary carpenters and cut and fitted with their tools.

Large quantities of asbestos are consumed in the manufacture of pipe and boiler covering, and it has many incidental uses in insulation, refrigerating and cold storage. The number of its uses is practically unlimited, in fact, and every day brings some new one.

MINES.

The mining of asbestos in Canada is confined to a very small area in the Province of Quebec, in the Counties of Megantic and Wolfe, in the Townships of Broughton, Thetford, Coleraine and Wolfestown. It is also mined at Danville, in the County of Richmond.

Of the mines, the Thetford group have even been the largest and most valuable producers, and the three large mines of that district, known as the Bell Mine, Kings' Mine, and Johnson's Mine, were among the first early workings in the history of the Quebec industry. The



ASBESTOS FIBRE, NO. 1 QUALITY.

Bell Mine, which is the largest producing property and with the largest developed area, has been unique in one feature, *i.e.*, underground working, and it has clearly proven that underground working, or tunnelling and drifting, can be successfully carried on without timbering for the winter months, as they have already some 1,700 feet of underground workings, which are shown by the accompanying illustrations. The main tunnel on this mine varies in height from 17 to 28 feet, and with a general width of about 18 feet. The side drifts varying in heights from 16 to 24 feet and general widths of about 12 feet. This is the only asbestos property in which underground mining has been carried on to any extent, and the tunnelling and drifting of the past 18 months has developed workings fully equal to the main quarry, which has worked for the past 25 years, showing an amount of material which will last for many years to come. The main quarry of this mine is about 700 feet long by an average width of 250 to 300 feet; the Kings' Mine, which immediately adjoins the Bell Mine, has an opening almost equal to the Bell property, and the Johnson's Mine, south of the Bell property and immediately adjoining it, have two large pits which are nearly equivalent in size to the Bell pit. The depths on all three properties are about equal—200 feet from the highest point of the knoll on which the original discoveries were made.

The methods of mining are nearly identical in all the Canadian properties, and they are worked as ordinary open quarries with overhead cableway systems. In this short description of the properties at Thetford, we practically give a description of the works at Black Lake, Coleraine, Broughton and Danville

The methods of treating the ore in all cases are practically identical. After the rock is blasted, as much of the large seams as can be readily picked up in the pits are first gathered, sent to the cobbing houses for further treatment or clearing of any bits of rock that may be adhering to them. The larger pieces of rock are then block-holed and re-blasted, so that they may be all passed into an ordinary jaw crusher of large dimensions, from 12 x 20 inch to 24 x 36 inch openings. The treatment is a continuation of gradual reduction; the asbestos fibre being drawn off in the process and separated into different lengths, which give it its value. The value of the material is in the length of the fibre and its cleanliness.

ASBESTOS VEIN IN THE SERPENTINE ROCKS

MULE ROOM—SHOWING PROCESS OF SPINNING.

WEAVE SHED OF A MODERN MILL.

Much could be said in reference to the milling of asbestos and the treating of the fibre, but to go into it exhaustively would hardly be interesting to those not directly concerned in the business. The handling of the waste material or non-productive rock, is one of the large

problems in the mining of asbestos, which may be appreciated by the fact that to handle the waste material of the three large mines at Thetford 11 locomotives and over 300 five ton ore cars daily are required.

The number of men employed in the industry in Quebec is over 2,000, and the annual wage roll for 1907 will be very close to the $1,000,000 mark.

The increase in the industry is best demonstrated by the fact that in 1878 only about 400 tons of ore was shipped, and this containing considerable foreign matter, while in 1906 over 50,00 tons of asbestos of different grades were shipped and over 20,000 tons of asbestos, the latter being the refuse of the mills and principally used for wall plastering; and the output for 1907 will show a large increase over former years, but even so the demand is much larger than the apparent supply.

THE CANADIAN ASBESTOS INDUSTRY

By Fritz Cirkel, Mining Engineer, Montreal.

The asbestos industry of Canada has shown for several years past a steady, healthful progress, and it is fair to assume, judging from the present activity displayed, that this condition will not only last but that the future will see a still larger delelopment of the existing resources in the region generally designated as the Black Lake, Thetford and East Broughton areas. This is principally due to the increasing demand for the refined article in the United States and in European countries. Prices for the crude as well as for mill fibre have advanced all round, and some of the mines and mills are taxed to their utmost capacity to fill the present requirements. This caused several companies, especially those possessing the larger mines and mills, to enlarge their plants, and has also stimulated the demand for undeveloped asbestos properties in an exceptional degree. However, the number of promising undeveloped properties, unlike any other established mining district, is very limited; and as Canada is looked upon as the country which supplies asbestos for nearly the whole world, it is fair to assume that the future outlook for the companies at present operating in the district is indeed very encouraging. The only trouble experienced for the last year or two is the scarcity of men, and several of the larger concerns have been working with a crew far insufficient for the capacity of their respective plants. Wages have consequently advanced, and where a laborer several years ago was paid about $1.15 and $1.25 for a ten-hour shift, to-day $1.50 and in some mines even $1.75 is paid.

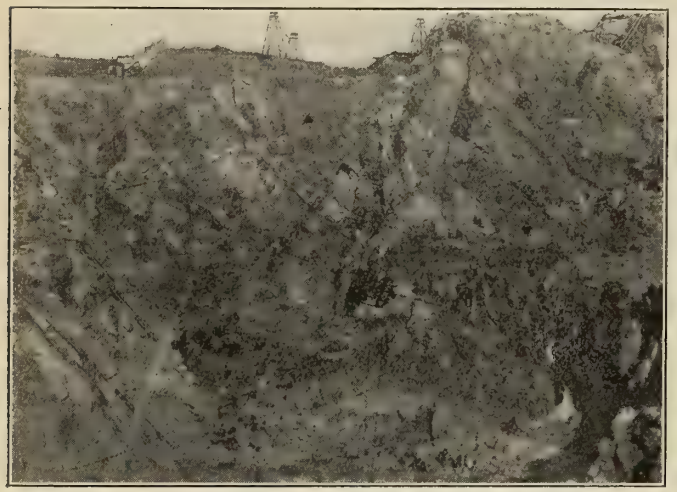
BLACK LAKE, P.Q.

Through the acquisition of several mines in Black Lake by American capitalists, this locality is displaying an activity never attained before. The American Asbestos Company, which put up a very elaborate milling plant several years ago at a cost of about $350,000, is employing about 240 men; in addition, the properties belonging to the Manhatten and the Glasgow and Montreal Companies have been acquired by the same company, and a crew of about 40 men is employed in these mines.

The Standard Asbestos Company is working at its full capacity; 45 men are employed, and the large pit, which now has been worked for a number of years, produces ore of an excellent quality.

The mill, which is located close to the mine, treats about 100 tons per day, and the fibre extracted is considered one of the best in the camp.

A part of the property belonging to the Standard Asbestos Company has been sold to American people, and the new company, the Dominion Asbestos Company, is putting up a large 300 ton mill, under the superintendence of Mr. Simpson.



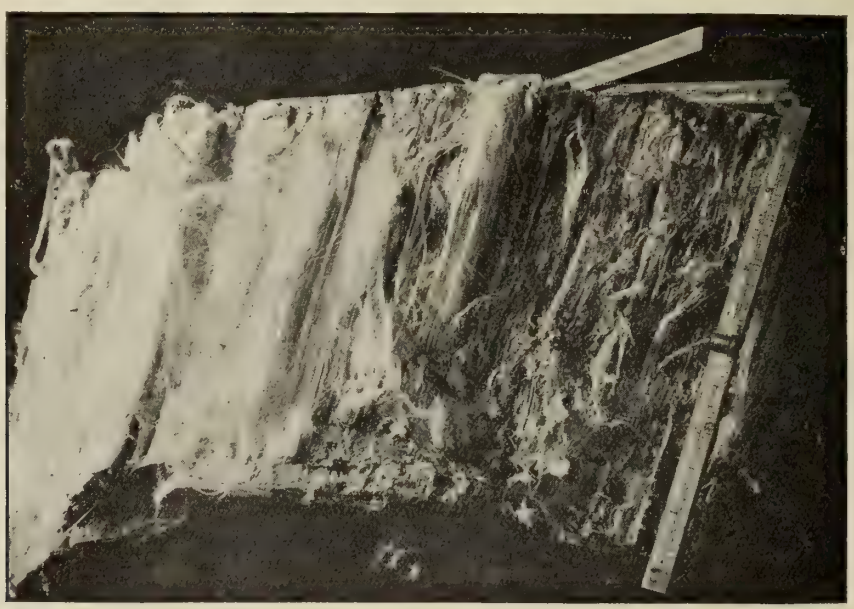
THE TOWN OF THETFORD, P.Q.

In Thetford an innovation has been made by Mr. George Smith, the manager of the Bell Asbestos Company, now controlled by capitalists of Ambler, Pa. An inclined tunnel has been driven, through which a direct rail connection is made between the large quarry and the mill. The entrance to this tunnel is located on the southern side of the Quebec Central Railroad track, and at a distance of about 800 feet from the big mill. It is intended to make this tunnel the principal part of a new elaborate haulage system to be installed at the mine; instead of the overhead cableways, the ore will be loaded in the pit directly into the large 3 ton dumping cars and drawn by machinery directly to the mill. It is claimed that a great saving is made in this way, obviating the necessity of hauling the ore twice. The tunnel penetrated some hitherto unexpected rich ground, and it is predicted that the same will form the main basis

for carrying on underground operations during the winter.

The Johnson Asbestos Company and the works of H. M. Whitney (formerly King Bros.' Mine), are working at their full capacity, while the Beaver Asbestos Company is working some very rich ground, recently discovered close to the old pit.

BIG QUARRY, BELL ASBESTOS MINE



Dr. Reed, of Reedsvale, has been developing his mine on Lot 13, Range V., Township of Thetford. Asbestos occurs here on the slope of a hill; several test pits have been sunk in a light green serpentine, resembling that of East Broughton. A cut 160 feet long into the slope of the hill exhibits some very fine veins of asbestos, and several trenches indicate the extent of the serpentine formation.

Broughton serpentine is completely shattered, is softer and can be far easier mined. The asbestos here forms small gashy veins, along the cleavage planes, is sometimes crushed and drawn out and seems at places to be disseminated through the whole mass of serpentine. The fibre, though some of it is short, is an excellent quality, being when freshly broken of a grass green color. Occasionally fibre measuring 1 inch and 1 1-2 inch in width is found. This area is located at a distance of about 22 miles from Thetford station, to the west of the Quebec Central Railroad. There are only two companies working at the present time in this belt, the Quebec Asbestos Company and the Broughton Asbestos Company.

The main pit of the Quebec Asbestos Company measures 200 x 75 feet, with a depth of 45 feet. About 50 men are employed. At the present moment the company's entire plant is being overhauled; a new Campbell dryer is being installed and importantant improvements are made in the mill. The latter will have a capacity of about 150 tons in a double shift.

As the drying of the East Broughton ore is always a matter of vital importance on account of the large amount of moisture the rock contains, improvements have lately been made in the rotary dryer, usually employed for the purpose. The main tube of the Campbell dryer has a diameter of five feet and a length of 35 feet, and contains 5 smaller inside tubes parallel to the main axis. By a special arrangement at the feed end, each smaller tube receives its quota of ore for drying, and it is claimed that through the increase of drying space the efficiency is brought up to its maximum.

The Broughton Asbestos Company, which works a property close to the Quebec Asbestos Company, has suspended its mining and milling operations for the last three or four months. The original capacity of the mill was 125 tons per day, but by the additions now being made, about 350 tons can be treated. Four large rotary dryers, several new cableways, with all the necessary machinery are being installed, while a new tramway is being constructed to haul the ore from the pits located in the northeasterly part of the property to the mill. Mr. H. H. Williams is the general manager of this excellently handled mine.

CRUDE ASBESTOS

Special attention has been paid lately to the asbestos mines at East Broughton. This small detached area of serpentine is enclosed between a highly quarztose slate and greenish schists of Cambrian age. Its largest width is about 700 feet, and its general trend about 20 degrees east of north. In comparison with the serpentine of Black Lake and Thetford, which is very hard, the East

A mill with a capacity of about 200 tons is now being erected by Mr. Phillip Angers, of Beauceville, and associates, on the valuable ground located between the mines of the Broguhton and the Quebec Companies. Very fine outcrops on this property show the continuation of the asbestos-bearing ground opened up by the two companies above referred to, and there is every reason to suppose that this intervening stretch will carry just as rich ground as that worked by the neighboring mines.

There is a possibility that the mines formerly operated by the Glasgow and Montreal people will be worked again. This property adjoins the mine of the Broughton Asbestos Company to the southeast; mining was here carried on many years ago, and was confined to a peculiar vein, which was developed on the southeast margin of the serpentine close to the contact with the overlying schistose slates, which have at this place a dip to the southeast of 65 degrees.

The asbestos veins, which in places assume a thickness of 10 and 12 inches, follows a wall of soft talcose rock or soapstone from 12 to 14 inches thick. The quality of the veins is excellent; they split up sometimes into fine strings through the sepentine, and at other places uniting and forming a continuous lead. The shafts were sunk to a depth of 60, 62 and 75 feet respectively, following the slope of the soapstone.

On the east half of Lot 13, Range VI., Township of Broughton, the northeastern extension of the East Broughton serpentine belt, on which the Quebec & Broughton Companies are working, has been established by numerous outcrops and test holes, and it is likely that a company which is now being organized in Quebec will develop this property on an extensive scale.

The Danville area, located at a distance of 38 miles in a southeastern direction from Thetford, is showing its usual activity; the Danville Asbestos Company & Asbestic Company is the only company operating at present in this district. This company, with is magnificent machinery plant and miling appliances, is capable of mining and milling about 600 tons of asbestos rock per day, and is considered one of the largest asbestos operators in the Eastern Townships. The serpentine is of a very fibrous nature, like the East Broughton species, and for this reason delivers an excellent material for the manufacture of asbestic.

At a distance of four miles from the Danville mines, several locations have been made in the Township of Tingwick, Arthabasca County, apparently in the same serpentine belt. On one of them, Lot 21, Range 11, prospecting and development work have disclosed a number of promising asbestos chutes. On the bank of a small river quite a number of asbestos veins can be noticed; in an open cut about 50 feet long and 15 feet deep, almost at right angles to the river bank, veins of asbestos 1-2 inch and 3-4 inch wide are exhibited in a number of places, while in a pit not far distant, about 15 feet deep, the continuation of the asbestos-bearing formation is established.

The property adjacent to that above described has been opened up to a considerable extent by New York people; a small separation plant has ben erected on the premises, and the tests with the ore from this property

VEINS OF ASBESTOS—ASBESTOS AND ASBESTIC CO'S MINE DANVILLE P.Q.

are reported to have been so satisfactory that the option on the property has been taken up recently by the parties interested.

In conclusion it may be said that the asbestos industry of Canada is of special interest to the mining and industrial world from the fact that, in so far as is known, the asbestos areas of the Eastern Townships contain practically the only deposits, where the mineral of a quality adapted for spinning and for the finer purposes of manufacture can be mined and milled at a profit. So great are the advantages which these mines possess, particularly as regards accessibility and the ease with which the extraction of the fibre is now accomplished in the mills, that, unless fields as yet unknown and as easy of access can be discovered, the Province of Quebec will long enjoy the privilege of being the principal source of supply for this particular mineral, not only on the North American continent, but in the whole world.

As a result of the great activity in the mining of this mineral there are to-day sixteen mills in operation, three others are in course of construction, while one will be erected in the course of the coming summer. The total capacity of all these mills when completed will be in the neighborhood of 4,500 tons of asbestos rock per day, with an approximate output of 250 tons of mill fibre. Since the introduction of machinery into the separation methods, the production of the crude has lessened a great deal; the mines of Thetford, with their exceptionally rich ground, produce at present the bulk of the crude, while Black Lake contributes also to some extent towards the supply of this quality.

ECONOMIC MINERALS OF NOVA SCOTIA

Catalogue and description of a collection at the Dominion Exhibition, Halifax. Prepared under direction of the Department of Public Works and Mines by Harry Piers, Curator of the Provincial Museum, Halifax, N.S., -906.

In this pamphlet, Mr. Piers has collected and collated information about all the economic minerals of Nova Scotia. Facts and figures have been used with discretion, and we would strongly recommend perusal of this pamphlet to anyone who wishes to learn something of the remarkable extent and variety of the mineral deposits of Nova Scotia.

Meanwhile it is not unprofitable to glance hurriedly over the main features of the catalogue.

Coal.—For the calendar year 1905 Nova Scotia produced 5,279,621 long tons of coal, being over 60 per cent. of the entire coal output of Canada for the year.

Coke is manufactured at Sydney, North Sydney, Stellarton, Westville and Londonderry for use in the blast furnaces at Sydney, North Sydney and Londonderry. The Dominion Tar & Chemical Company, Sydney, obtains coal tar from the Dominion Iron & Steel Company, and manufactures refined tar, roofing cement, black varnish, crude naptha, light oil, carbolic acid, creosote oil, shingle stains of various tints, soluble disinfectant, roofing pitch, etc.

Gold.—The gold fields of Nova Scotia cover about 3,000 square miles, exclusive of the masses of intrusive granite. The gold-bearing strata, of Lower Cambrian age, have been folded into numerous anticlines and synclines, having a general east and west course and north and south dips. The gold-bearing quartz assumes the form of intercalated veins between the strata of the rocks. Denudation of the crowns of the anticlines often exposes long elliptical outcrops of the veins. Where the lower veins, untouched by denudation, pass over the axes of the anticlines, they thicken, forming "saddle backs."

Fissure veins, cutting the strata, also have been worked.

Alluvial gold is found in many places in Nova Scotia.

Nova Scotian gold has a fineness of over 900, and occurs largely as free gold in quartz, accompanied by sulphides of iron, copper, zinc and lead. Arsenopyrite is also a usual concomitant of gold.

From 1862 to 1905, inclusive, Nova Scotia has produced $15,859,345 in gold. This was obtained from 1,688,649 tons of quartz, being an average yield of 9 dwt. 22 grs. per ton., valuing the gold at $19 per ounce.

Antimony.—Stibnite, or sulphide of antimony, is mined at West Gore, in Hants County. It was discovered in 1880 on J. McDougall's farm. The ore occurs in two main fissure veins, called respectively the North and South veins. The North vein runs north 45 degrees west and dips 85 degrees to southwest, and has been traced for over 1,200 feet. It varies from a few inches to 7 feet, and has been solid stibnite in its widest part. The ore chute dips 45 degrees to the southeast. More or less gold is found in the ore, and it seems to be richest in that metal when the percentage of stibnite is high. The gold values vary from $200 per ton to $23. For a long time it was not known that the ore contained gold.

Graphite.—In some cases this mineral occurs in apparently workable quantities, but no attempt so far has been made to exploit the deposits. H. T. McDougall's property, near Christmas Island, Cape Breton County, showed:—

Graphitic carbon	50.23 per cent.
Rock matter	43.37 per cent.
Water	6.50 per cent.

Copper.—Native copper occurs at Cape d'Or in veins and joints in the triassic trap. Chalcocite, malachite, chalcopyrite and bornite are found in various localities in Pictou, Antigonish, Colchester and Inverness counties. The chalcopyrite usually carries gold and silver values.

Lead.—At Smithfield, near Upper Stewiacke, Colchester county, galena is found in carboniferous limestone, apparently replacing it in part and as a residual concentration from the removal of the rock. It is argentiferous. Certain limestones in Pictou, Colchester, Halifax, Guysboro', and in Cape Breton at Cheticamp, carry galena which is more or less silver-bearing.

Iron Ores.—Ores of iron are known in workable amounts in nearly every county of Nova Scotia. Magnetite, red hematite, limonite, ankerite, siderite, paint ores, etc., occur. At present mining operations are confined chiefly to the property of the Londonderry Iron & Mining Company, Colchester county, and to the Torbrook district, Annapolis county. Deposits are known at Clementsport, Clifton, Brookfield, Arisaig, East Bay, Boisdale, etc., etc.

Pyrite.—Large deposits of pyrite and pyrrhotite have been found in Cape Breton at George's River Mountain.

Tungsten.—Hübnerite, a tungstate of manganese, has been found near Emerald, Inverness county. Scheelite, or calcium tungstate, occurs in the Malaga gold district.

Hübnerite was discovered in 1898. It is distributed irregularly through a mass of grayish-white quartz weighing about a ton and a half, at the outcrop of a lenticular vein of similar quartz some 2 1-2 to 3 feet in width, cutting a red gneissic or granitic rock of pre-Cambrian age.

Manganese.—The ores of manganese found in Nova Scotia are noted for their purity. They occur in the limestone series of the carboniferous at a number of places in the Province. The best known locality extends from Tenny Cape to Walton, in Hants county. Here the ore has been worked at intervals for a number of years. At one time the price realized was as high as $130 per ton. The ore occurs in stringers and pockets in limestone at its contact with the underlying sandstone. Surface indications along the contact are extending over a large area, but little work is being done. Similar ores are met in Colchester county and in Cape Breton. Their value will be enhanced when railway communication has been improved.

One pocket of pyrolusite at Tenny Cape yielded over 1,000 tons of ore of exceptional purity. Pyrolusite is the prevailing form in which manganese is found, but psilomelane and manganite are also found.

Gypsum.—Deposits of this mineral are very abundant in the carboniferous limestones of the central, northern and eastern counties, and some of the beds are of great thickness. The principal quarries are operated near Windsor, Hants county. About 150,000 tons are exported to the United States annually.

Limestone, dolomite, and barite are of very frequent occurrence in various parts of the Province.

Diatomaceous Earth.—Deposits of diatomaceous or infusorial earth are common in lakes and swamps, and have been worked at Bass River, Colchester county, and at St. Ann's, Victoria county. It is used for polishing purposes, as a non-conducting material, for making soda silicate, and also as an absorbent in the manufacture of dynamite. The Bass River deposit is operated by the Fossil Flour Company.

Talc and Pyrophyllite occur in Cape Breton in commercial quantities.

Building Stones, such as sandstone, granite, limestone, metamorphosed slate, etc., are worked in many places. Several grindstone quarries are in operation.

Clay, Brick and Pottery industries are carried on in several counties.

Fire Clay, Moulding Sand, Roofing Slate and Pigments may also be mentioned.

Brine.—The Nova Scotia Oil & Gas Company borehole, Cheverie, Hants county, was put down to find petroleum. A large flow of brine was encountered.

The above gives but a scanty suggestion of the variety of Nova Scotia's mineral resources. Were a fraction of the money that is being flung freely to the vendors of worthless mining stocks to be diverted to the development of some of the deposits enumerated above, Canada would be richer by several new and successful industries.

REQUIREMENTS OF MODERN MINING

By J. R. Finlay.

(Reprinted from the *Mining and Scientific Press.*)

But neglecting questions that must become vital with our immediate descendants, it is interesting to consider the vast extent and variety of the mining industry as it stands to-day. The field is so great that it permits only of specialists. Does any one man know, in a practical way, the mode of occurrence of most of the valuable minerals? Does he know coal, iron, copper, gold, silver, lead, zinc, cement, precious stones, as they occur in the earth? If he does, can he possibly know the processes required to get them to the surface, and put them in marketable form? If he knows this, can he possibly know how to market them? If he knows all these things, will he then know how to finance and launch enterprises to exploit them?

We call a man a mining engineer if he can make an underground survey; a mining man if he owns some stock in a prospect. From these crude beginnings the experience of many individuals makes great advances, but it seems incredible that any intellect, or any energy, would be sufficient to get more than a thin comprehension of the vast subject.

I used to think I would be quite a mining man when I reached the position of superintendent of a property. Later I found that achievement to mean little. Success in handling one mine may be due to some quality that may be next to useless in the next one. At the first mine a man may need only operating talent—capacity to organize and get work out of men. At another, such ability may be absolutely unavailable, unless it be joined with intelligence and training in finding ore. As a man's experience in mining widens, he is constantly reproaching himself for want of knowledge on essential portions of the business, until he finally consoles himself with the reflection that if he had learned the things he doesn't know, he might on that account remain ignorant of the things he does know. At best, one's brain and one's opportunity have their limitations, and it does not take an intelligent man many years to convince himself that pretension to know the whole mining business can be nothing but a fraud, and the expectation to do so only a delusion. Nevertheless, if one may cover the requirements in the case of one or two metals, his equipment will be abundant to secure him his "shoes and tobacco"; and it may be of interest to discuss what these requirements are. I venture the following generalization:

The business of mining involves

1. Ore and mineral deposits.
2. Operation of mines.
3. Processes to render mineral products marketable.
4. Marketing.
5. Financing and organization of enterprises.

The first division is entirely in the realm of natural phenomena and facts. The second and third deal partly with nature in the handling of them. The fourth and fifth divisions are wholly matters of human dealings. It is rather painful to the striving engineer, after laboring over the science and technology of his profession, to find that after all he has been working on a small part of his business, and that the least important. In its broad aspects mining is far more of a question of human relations and facts, than of natural relations and facts.

Now it may be objected that this generalization is either self-evident or meaningless. I shall give an illustration to show how all these considerations must be weighed in the commonest problems of mine operation. At Joplin, Missouri, the ore consists of pieces of singularly pure galena and blende, distributed unevenly through the rock. If these ores could be sorted by hand, it would be easy to pick out stuff running from 30 to 60, or 70 per cent. in zinc or lead. Naturally it would be

desirable to do this, instead of crushing the beautiful crystals in a mill and thereby losing 20 to 50 per cent. of them. Why not do it? Simply because the market conditions at Joplin do not allow it. Local practice, too strongly intrenched for the small operator to interfere with, and doubtless founded upon good reason, dictates that a zinc ore must be cleaned until it carries about 60 per cent. zinc. Failure to bring the ore up to this grade is penalized so severely as to wipe out any possible profits in saving mill costs and losses by hand sorting. It is obviously impossible to depend on hand sorting to produce from a low grade mixture an ore that will conform to a rigid standard of value.

Here we see the human condition of marketing reacting imperiously on the method of mining. It makes a mill necessary, where under a different market it might often not be necessary. It throws the industry into a certain channel, out of which the operator cannot go without meeting certain failure. This consideration influences the view one must take of the value of a deposit, the method of mining, the requirements of milling, and, consequent on all these, the financing of a project.

In the Rocky Mountain region the smelter imposes no conditions except a freight and treatment charge, varying within modest limits according to the grade and composition of the ore. Here the question of what it is wise to spend on mining and sorting on the one hand, and how much to lose in a mill and how much to pay for freight and treatment, on the other, is a very broad one. It may be capable of many solutions, each of which may mean a different result in dollars and cents.

A gentleman in charge of a large and valuable group of silver-lead mines announced the other day, with breathless triumph, "I have raised my mining costs 10 per cent., raised the grade of my ore 25 per cent., and increased my profits 100 per cent., and, do you know, my directors are kicking about my high costs!" I submit that in this case millions of dollars in mine valuation depend upon a trick of mine operating. What a different view one would take of the property before and after the determination of the above results!

In like manner we hear of important interests in coal mining being rendered dangerous as investments, because the railroads will not furnish cars. Here the question is apt to be, not what kind of a mine have you, but, what are your relations with the railroad?

It is probably true that in the majority of cases the determination of trade and finance questions is left to specialists in those lines. Indeed, in any event, there must be questions of this kind that are as inherently the work of specialists as the work of an assayer or a machine-runner. My point is, that the mine manager or the mine valuer must be broad enough to recognize the fact that the man who sells ore, or buys ore, or promotes a scheme of mining enterprise, has just as much claim for recognition as a factor in the business as the mine superintendent or the metallurgical engineer. Perhaps far more. Reflect, that the men who now control the greatest enterprises are not mining engineers; they did not even begin as mine owners; they were business men whose business was refining oil and selling it, or financing smelting enterprises; they were men whose wits were sharpened by competition. There is not competition in the ownership of a bonanza mine. The owners are generally spoiled by having too much of a snap; they have not, as a rule, expanded to the true requirements of their business, and while hugging themselves for their success, they are really stagnating in a small corner of the field.

Much has been written about mine valuation, and mostly with a failure to recognize the full scope of the subject. Everyone knows that to take samples and measure the ore in reserve by some fixed rule, requires no more than honesty, care and some knowledge of solid geometry. That does not go far. The mine remains, and new ore is found after the ore once in reserve is gone. The geologist may go further and arrive at a correct conception of the persistence and extent of the mineralization, but does he know what the ore can be mined for? In many cases he does not know. The foundation is laid, let us say, that a million tons of ore may be relied on, carrying a certain amount of various metals. Still the valuation is only begun. The great problems remain of how it can be mined, how milled, how smelted, and how marketed at the maximum profit; and how may an enterprise be organized and financed so as to realize the maximum profit for the investor. I contend that the answering of these questions is by far the greater part of mine valuation. A mine may be a grand success, financed at $10,000,000, and a dreadful failure if financed at $5,000,000. Who will decide this? A man who can operate a mine? One who understands ore deposits? One who can operate a smelter? A man who can sell steel rails or cuff buttons? A man who can furnish the money? None of these. All of them together can perhaps; but very much better a man who can weigh with discrimination the evidence of each.

I venture to say that the men in this country who are able to bring to bear on a gold mine, or a copper mine, or a lead mine, such an equipment, and who have an opportunity to do it, may certainly be counted on the fingers of one hand. If these problems are so complex and far-reaching to-day, they are sure to be more complex and more far-reaching. What financing and what methods will be required twenty-five years hence, when the world will require several times the amount of mineral products it requires to-day! It is difficult to imagine, from present knowledge, how such vast demands are to be met. "Ore in sight" will not meet them. Scientific exploration and development, improved methods, the use of new materials to substitute those now in use, will all help. To do these things is a splendid field for good brains. It is a comfort to know that the business of mining is no fake, but a most essential—and perhaps the most distinctive—part of modern civilization. Many a young man now behind a tramcar, or a drilling machine, thinks mining a pretty tough business. So it is. So is war also a tough business. If war produced the greatest reputations, mining has produced the greatest fortunes of the world; and in both there is room for future Napoleons.

PEAT

The principal difficulty in the utilization of peat as a fuel for the various processes of manufacture, or for domestic purposes, is apparently the large quantity of contained moisture and the great difficulty experienced in its removal. This difficulty arises in large part from the porosity or springiness of the material, and many trials and experiments have been made by which this tendency to absorb moisture could be checked when once it had been eliminated. As a result of these, the plan of pulverizing the peat as it comes from the bog, drying it as rapidly as possible, and then solidifying it under great pressure, has been found to yield the most satisfactory results.

THE ANALYSIS OF SILICATE AND CARBONATE ROCKS.

By W. F. Hillebrand, Bulletin No. 305, United States Geological Survey.

This bulletin so thoroughly covers the ground outlined by the title that it could very appropriately be termed a manual.

Dr. Hillebrand, in his introductory remarks, dwells upon the small amount of energy devoted to mineral analysis as compared with the enormous volume of work spent upon the organic field.

To more strongly emphasize the importance of completeness in analysis, Dr. Hillebrand cites a few facts, deduced from hundreds of rock analyses. The existence of small percentages, usually not over 0.1 per cent., but sometimes much more, of barium and strontium in the igneous rock of the United States and in their derivations, has been conclusively proved. The amount of barium is almost always in excess of that of strontium; and the igneous rocks of the Rocky Mountains show far higher average percentages of both metals than the rocks of the eastern and more western countries. "Surely," says Dr. Hillebrand, "this concentration of certain chemical elements in certain geographic zones has a significance which future geologists will be able to interpret if those of to-day are not." Continued investigation has thrown much light on the distribution of vanadium and molybdenum.

A particularly pointed exemplification of the benefits of complete analysis is given on page 19. By invariably looking for sulphur in rocks, even when no sulphides were visible to the eye, Dr. Hillebrand found that it is almost always present. This demonstration clears up the mystifying disparity between results of ferrous iron determination obtained by the Metscherlich and the hydrofluoric acid methods. Sulphur can almost always be detected in 2 grams of rock powder. Almost all rocks and many minerals carry pyrite or pyrrhotite in considerable amount or in traces.

The thoroughness of the United States Government Laboratory work is shown by the care with which every step in the preparation of samples is investigated. For rock analysis, 20 grams is recommended as a suitable quantity for fine grinding, and agate mortars are preferable to glass or steel. The limits of error in summation of analytical results are set by the total figures, 99.75 and 100.75.

SOME PRINCIPLES OF COAL WASHING

WRITTEN FOR THE CANADIAN MINING JOURNAL.

The great majority of North American coals are fit, as mined, for steam-raising and general purposes. Many of them, however, contain sufficient impurity to render incompatible with the highest economy, or even commercially impossible, their immediate employment in metallurgy. Others, notably certain European coals, contain, for practically all purposes, prohibitive amounts of impurity. Relatively few, and quite inadequate to the enormous demand, are those which, as received at the mine bankhead, can be converted forthwith into coke meet for the ironmaster's use; and hence arises the necessity for the coal-washer, which we shall here consider exclusively as the sentinel of the blast furnace.

What are the impurities, whose presence in excess unfits a coal, otherwise suitable, for the manufacture of blast furnace coke? What constitutes an excess? Can this excess be economcially removed? There are the questions which, answered in the light of local and prevailing conditions, determine the attitude of the blast furnace superintendent toward any coking coal.

I.—Impurities in coal may be classified as:—

(a) Innate.
(b) Sedimentary.
(c) Infiltrated.

Innate impurities are chiefly such percentages of silica and alumina as, originally present in the ash of the parent plant, have persisted in the coal. They seldom constitute less than 2.00 per cent. or more than 4.00 per cent. of any coal. In very rare instances they represent the total impurity.

Sedimentary impurities are chiefly slates, shales, and clay stone, formed by compacted layers of sediment deposited from surface waters during the accumulation of a coal-forming vegetable debris, or during short periods of submergence, followed by emergence, and further vegetable accumulation.

These processes result variously in the interpolation in the coal seam of layers of slate, splint, or bone coal, according to the distinctness and relative thickness of the successive deposits of organic and sedimentary materials.

Under this head come also such fragments of roof or pavement as have become mixed with the coal in mining.

Impurity from this source will be slight in a hand-pick mine, but may become excessive where coal-cutting machines are employed.

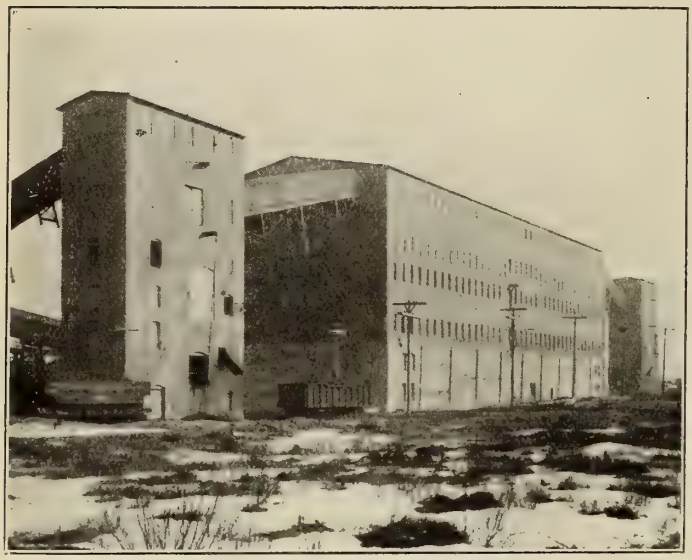
Infiltrated impurities are those which have been deposited in the bed of vegetable debris, after its formation, from either suspension or solution in the percolating water; *e.g.*, calcite, baryta, iron oxide, phosphates, arsenides, etc., and notably sulphur, which usually occurs in one or more of three forms, viz.:—

1. Sulphides, chiefly sulphide of iron or pyrite.
2. Organic sulphur.
3. Sulphates, chiefly sulphate of lime, or gypsum.

Pyrite is formed by the reduction of ferrous sulphate in the percolating waters, or by the action of sulphuretted hydrogen in those waters, on ferric hydrate previously precipitated. Pyrite occurs as pseudomorphs, balls, lenses, plates, crystals and scales.

Under organic sulphur we include a number of imperfectly understood compounds of sulphur with carbon, hydrogen, oxygen and nitrogen, formed by the direct action of sulphuretted hydrogen on the decaying vegetable matter.

Sulphates are not so commonly met with, but both pyritic and organic sulphur co-exist in greater or lesser amounts in nearly all coals. As will presently appear, the distinction between the organic and pyritic forms is of gravest import in coal-washing.



The most usual test for impurity in coal is a simple determination of ash and total sulphur. The ash includes all silica, alumina, iron, lime, magnesia, phosphates and other earthy matters present in the coal. In the absence of notable quantities of phosphorous or arsenic, such a test suffices. If there be a washing problem on hand, pyritic and organic sulphur must be separately determined.

To appreciate the effect of the various impurities in the blast furnace, we must briefly trace their history in the coke oven. Here we find:—

1. That all the ash of the coal, and practically all sulphur present as sulphate of lime, barium, etc., are retained in the coke.

2. That all pyrite is broken up according to the equation $FeS_2 = FeS + S$; half of the pyritic sulphur remains in the coke, and half passes off with the volatile matter.

3. As to the organic sulphur, authorities disagree. Some maintain that it practically all remains behind in

General view of Coal Washer, Dominion Iron and Steel Co., Limited Sydney, N.S.

the coke. On the other hand, it is averred by others that all such sulphur is volatile. It is probable that neither of these contentions is wholly correct in any instance.

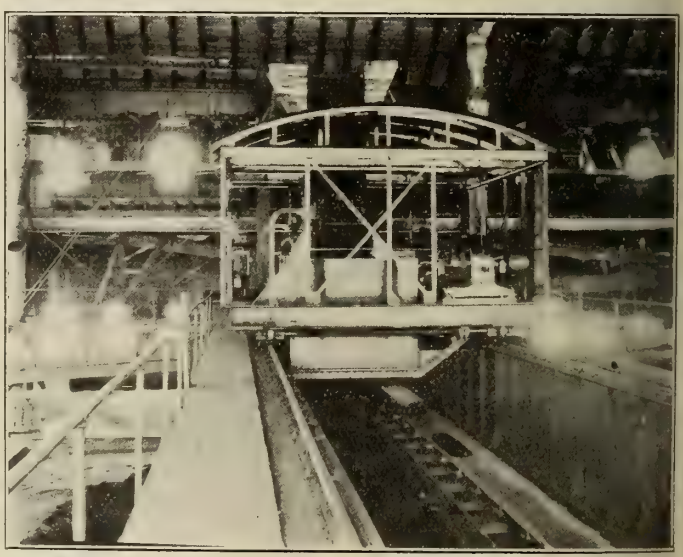
A. L. McCallum, in a paper recently read before the Dalhousie Journal Club, of Halifax, described some experiments performed by him upon certain Cape Breton coals. His work clearly shows that, at least in the case of the coals in question, a part of the organic sulphur is always volatile; that, as the percentage of organic sulphur increases, its volatility also tends to increase, that the proportion of it volatilized is practically never more than one-half, and nearly always much less than this.

It is customary, in practice, to assume that half the coal sulphur persists in the coke, for the reason that no coal containing more than very small percentages of organic sulphur is ever used in the coke oven.

Keeping this in mind, we obtain, by means of a crucible test, the approximate coke yield of the coal under consideration, and from the percentages of ash and sulphur in the latter we calculate the ash and sulphur content of our coke.

II.—The question as to what constitutes an excess of coal impurity can now be answered by a similar inquiry regarding coke. The ideal coke would contain neither sulphur nor ash. Such a coke is, of course, not commercially available.

As to what constitutes a prohibitive percentage of ash, two facts must be borne in mind; that increment of silica and alumina in the ash requires a corresponding added increment of flux and fuel in the blast furnace, and causes a proportionate increase in the ratio of slag to iron produced; and that all ash, whatever its analysis, is a diluent—it decreases the calorific power of the coke, and, moreover, eventually weakens the coke structure. The whole question is one of economy. A blast furnace is nearly always located with reference to a definite ore supply. Flux of reasonable purity is so widely distributed that it is seldom a determining factor in the calculation. The furnace, then, must be viewed as a producer of iron and slag. The quantity of impurity in the ore is fixed; local conditions will largely determine the economic limit of the slag—iron ratio; and from these data, and a consideration of the sulphur content of the charge, the maximum amount of coke ash permissible in any case may be calculated. Only under the most favorable conditions can a coke with much over 11.00 per cent. be economically employed.



The limit of sulphur, the "blower's bane," is easy to define. A discussion of the deportment of this element in the blast furnace would lead us too far from the subject in hand. Suffice it to say, that it would be below 1.00 per cent., the farther the better, and should never exceed 1.50 per cent.

III.—Experiments made upon coke with a view to reducing its sulphur content have proven signal failures, as perhaps might have been anticipated. We therefore return to a consideration of the coal.

All coal-washing operations are more or less elaborate forms of gravity separation, and depend directly upon differences in specific gravity between coal and its associated minerals. To illustrate: Suppose that we have for examination a one-ton sample of mine-run coal, whose suitability for metallurgical purposes we desire to ascertain. We find that it contains pure coal, bone coal, slate and pyrites. We make several careful determinations, and find that the average specific gravities of these various constituents are, in our particular sample:—

Pure coal	1.29
Bone coal	1.50
Slate	2.43
Pyrite	4.90

The impurities appear, perhaps, to be very intimately associated with the coal; moreover, some of the bone coal

Washed Coal Elevator. The suspension rods and troughs o one battery of tables appear in the upper background. Dominion Iron and Steel Co., Limited, Sydney, N.S.

can be differentiated into more or less pure coal, and more or less carboniferous slate. We therefore crush our sample so that it wholly passes a three-eighth inch screen, or to whatever degree of fineness may be necessary to unlock the impurities. From this ton lot of

crushed coal we select a four or five pound representative sample, weigh it carefully, and place it in a two-thirds gallon cylindrical jar, preferably of glass, which has previously been almost filled with a calcium chloride solution of density slightly greater than that of the pure coal and less than that of all the other constituents (e.g, of 1.30 sp.g). We briskly stir the contents of the jar, and allow to settle. The sample is now found to be

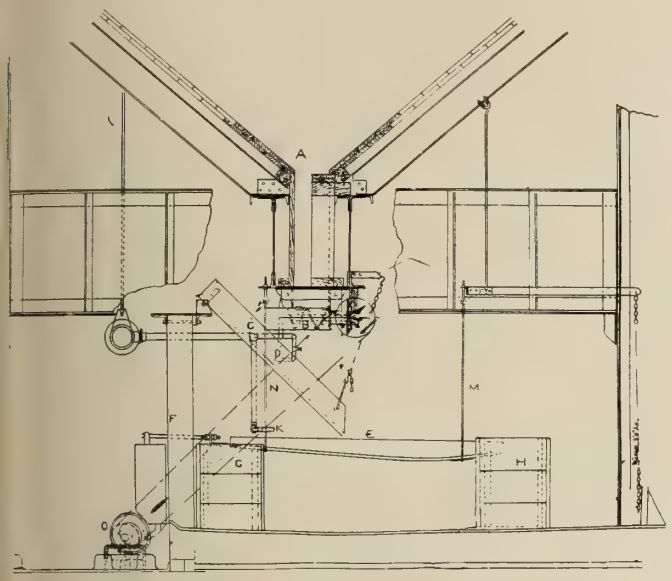


FIG. 1. GENERAL ARRANGEMENT OF CAMPBELL COAL WASHER.

sharply divided into two main portions. All particles of a specific gravity less than 1.30 have floated, while all particles heavier than this have gone to the bottom. Between these two layers there remains suspended in the solution certain particles, negligible in aggregate, whose specific gravity is about 1.30.

Floating and sinking portions are separately removed, placed on draining cloths, washed free of calcium chloride, dried, weighed, and analyzed for sulphur and ash. From the data so derived we calculate the purity and yield of the floating portion, or "washed coal," obtainable from the original lot of mine-run coal. This is the simplest and most effective coal-washing operation that can by any means be performed.

The results of such an experiment determine absolutely for any coal the maximum purity of the washed coal obtainable from it by any process whatsoever. Two very obvious inferences give us at once the answer to our third question.

(a) Only such impurities can be removed as are capable of being disassociated from the pure coal by crushing or other mechanical means.

(b) Any impurity whose specific gravity is not materially greater than that of the pure coal will inevitably persist in the washed coal.

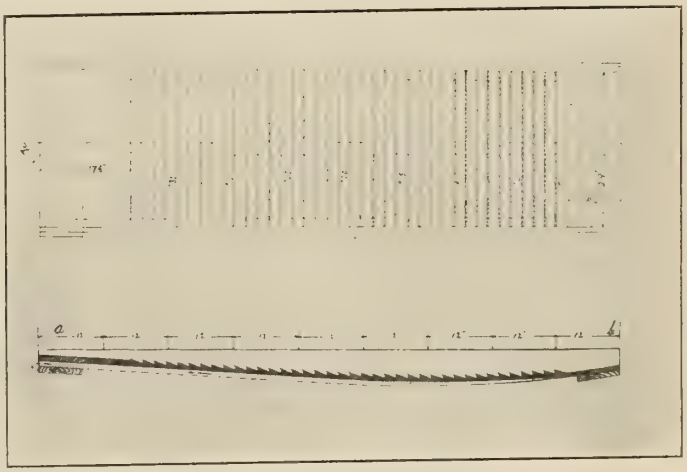
Referring now to the various coal impurities already described, it is clear (1) That innate impurities can never be washed out. Therefore, as a very general rule, washed coal must contain at least 2.00 per cent. of ash. (2) That all sedimentary and infiltrated impurities, being heavier than the coal, are removable to just such extent as they can be differentiated by disintegration. (3) That organic sulphur, which is held in combination in the coal proper, and whose compounds are of like density with the coal, cannot be removed by any washing process. In view of this, the importance of a knowledge of the nature of the sulphur content becomes too obvious to need remark. Thus much for qualitative results.

In describing the calcium chloride experiment, we assumed the dividing line between constituents of different gravities to be sharply drawn. Though this in many cases is reasonably near the truth, it not infrequently happens that, however thorough the disintegration, there remain many particles, which are mixtures of coal and impurity in all proportions, so that there are representatives of every degree of specific gravity between that of pure coal and that of slate. Such particles all sink in a solution of 1.30 sp.g., and much good material is thereby lost in the "sludge." If we substitute a solution of 1.35 sp.g. many of these mixed particles rise to the surface and become washed coal; and we thus get increased yield, with decreased purification. In the same way, if the density of the solution could be definitely raised, we might go on obtaining progressively greater yields of continually diminishing purity until, with a yield of 100 per cent., the whole sample floated and the purification became nil.

However pure it may be, unless the floating portion constitutes a reasonable percentage of the raw coal, the economy of the process becomes doubtful. In the case of coals, therefore, whose impurities can not be sharply differentiated, it may be advisable to sacrifice quality to quantity to an extent which, for each separate instance, must be determined by the economic conditions. These remarks, be it well understood, apply strictly to ash, and then only within very narrow limits.

With sulphur, there must be no compromise. As a matter of fact, sulphur, if removable at all, is usually easily and economically removable, and calls for no compromise.

Unfortunately, the calcium chloride separation, though a beautiful laboratory method, and invaluable as a sure indication of the possibilities of a coal, is too slow and costly to be commercially applicable. Some cheaper and more practical separating medium must be substituted, and we find that water is almost universally employed in this capacity Air has also been utilized to a limited extent. Water being less dense than coal or any of its



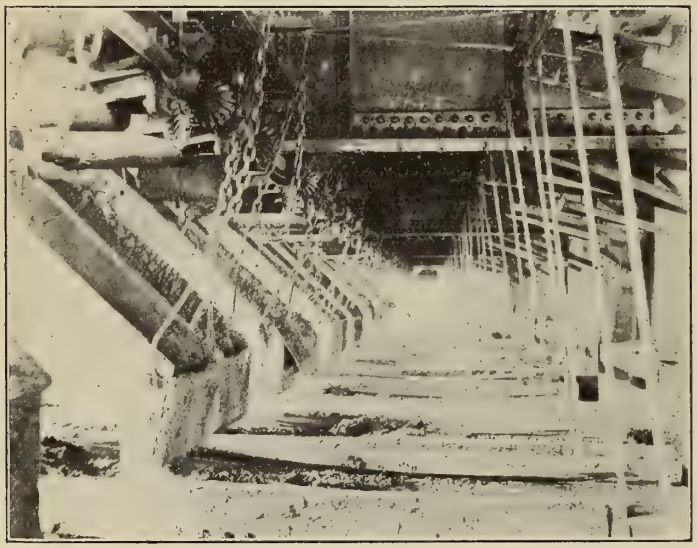


FIG. 2. CAMPBELL TABLE PLAN AND SECTION.

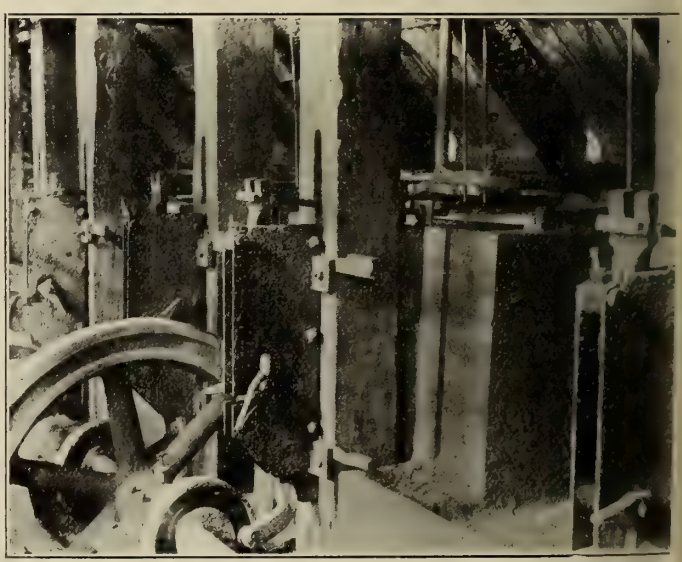
ordinary impurities, does not give, like calcium chloride solution, a positive separation of the constituents, but, since all particles sink, a relative separation, depending upon the different rates of fall of the heavier and lighter particles.

Laws of Settling.

The rate of fall in water, *i.e.*, the "settling velocity" of any particle, depends upon its gravity and upon its size and shape.

I.—Of two particles of the same size and shape, the heavier will settle faster than the lighter; consequently, if a number of fragments of pure coal and slate, of identical size and shape, be simultaneously dropped into a

GENERAL VIEW OF CAMPBELL COAL WASHING TABLE.
Dominion Iron and Steel Co., Limited, Sydney, N.S.



very tall, narrow cylinder of water, the slate reaches the bottom first, and the pure coal last. We have thus obtained a separation according to settling velocities, *i.e.*, according to specific gravity, since the shape and size of all the particles is the same.

II.—Of two particles of the same specific gravity, but of different diameters, the particle of greater diameter has the higher settling velocity. If we repeat the settling experiment, using mixed sizes of slate alone, the largest slate particles will be found to constitute the bottom layer, and the smallest the topmost layer Between these fall the intermediate sizes. Here again we obtain a separation according to settling velocities, and this time the specific gravity of all particles being the same, according to diameters. The same thing is true of mixed sizes of coal alone.

III.—If now we perform the same experiment upon mixed sizes of coal and slate, we still obtain a separation according to settling velocities, but both gravity and size come into play. The largest slate fragments will be found on the bottom. On top of these will be a layer comprising the next smaller size of slate with the largest size of coal, and so on to the topmost layer, which will be found to consist of the very smallest coal particles. However often we repeat this operation, the make-up of each horizontal layer, and its relation in space to the other layer, will in every case be practically the same. We shall also find that the ratio of the diameter of any coal fragment to that of any slate fragment in the same horizontal layer, or, as it is called, the "settling ratio," for these two minerals, is approximately constant for all layers. What has been said of coal and slate applies in the same way to coal in relation to any other impurity that is mechanically separable from it, the settling ratio being greater or less, as the difference in specific gravity which just pass the same screen the round fragments increases or decreases. We therefore generalize as follows:—All particles of the same settling velocity will be found in the same horizontal layer. Of two particles with the same settling velocity, that with the higher specific gravity is of smaller diameter than the other. The ratio between these two diameters, *i.e.*, the settling ratio, is, for any two minerals, constant under the same conditions. With regard to shape, of a number of fragments settle first, the longish ones next, and, last of all, the flat ones.

What is the significance of these settling laws with reference to coal-washing? This: Our task is to separate as completely as possible the coal from the slate or other impurities. From what has been said it is evident that we cannot accomplish this with a mixture of raw-coal fragments of all sizes by any method depending upon settling ratios. It is not possible, or at least not practicable, to reduce all particles to the same size, and so bring our problem directly under Law I. What we can do, however, and must do, to secure reasonably perfect separation, is to screen the coal into fractions such that the settling velocity of the largest coal particle, in any one fraction, is less than that of the smallest particle of impurity in the same fraction. Unless such screen classification precedes the water treatment, complete separation will not be effected. Obviously, the lower settling ratio of coal with reference to any impurity, *i.e.*, the nearer the gravity of such impurity approaches that of pure coal, the closer the sizing must be. Whereas, if the coal be considerably lighter than the lightest impurity, less sizing is called for.

The settling laws are still more strikingly and practically exemplified by means of a "sorting column." This, in its simplest form, is an upright glass cylinder having an inlet at the bottom, through which a gentle current of water at constant pressure is admitted. Coal and slate fragments are allowed to fall into the cylinder

Rear view of Washing Tables, showing spray pipe, false bottom, sludge receiver, bumping post, cam and bumping device. Dominion Iron and Steel Co., Limited, Sydney, N.S.

against this rising current, "the velocity of which" (Richards' "Ore Dressing") "is much less than the free-falling velocity of the particles, but yet enough so that the particles are in motion. Every particle in the mass is poised in the upward-moving water. If a grain above has a greater settling power, it quickly gets below. If one below has less, it quickly rises." The result is a series of layers, arranged similarly to those obtained with

the settling tube. Moreover, so positive is this arrangement that if any particle, having found its own level, be, by some external force torn from its own little colony of co-settlers, it will, when released, return to practically the same group as before. Particles freshly added to a column already so arranged speedily find their proper horizon as demanded by their settling velocities.

A comparison of the layers from such a sorting column, with those obtained from the same coal mixture by means of the plain settling tube, discloses the fact that the coal particles co-existing with a given size of impurity in the sorting column are uniformly of much greater diameter than those consorting with the same size of impurity in the settling tube. In other words, the sorting column gives much higher settling ratios than the settling tube does. This remarkable state of affairs has been shown to be due to the fact that the conditions obtaining in the settling tube are those known as "free settling," *i.e.*, every particle falls independently of all the others, whereas, in the sorting column, the particles are crowded together and each must settle issues, not only with the water, but with its neighbors as well. This crowded condition is described as "hindered settling." Hindered settling owes its superior effectiveness to certain phenomena connected with interstitial fall, which need not here be gone into.

It should be remarked that if the water current of the sorting column be made strong enough to carry the coal particles over the top of the cylinder, and allow only the slate to remain behind, the conditions become those of free settling.

All settling phenomena, as already intimated, are dependent essentially upon gravitation, and the path of the particles through the water is essentially vertical. The same general principles obtain equally when the particles are projected in a horizontal direction through the separating medium. To quote once more from Richards, "when a particle is given a high velocity in a horizontal direction, its path is called its trajectory." Of two particles of the same size and shape, the heavier will have the longer trajectory, and of two particles with different gravities but the same trajectory, that with the higher gravity will be of smaller diameter than the other.

The laws of horizontal travel are exemplified in the bumping table, long used in ore dressing, and more recently introduced, and with great success, in coal-washing.

We shall now briefly consider the practical application of the principles already outlined.

All washing processes must be preceded by a sufficient degree of crushing to unlock the impurities. Insufficient crushing causes a decrease in both yield and purity of washed coal, since larger coal fragments will buoy up small adherent masses of impurity, and, conversely, much pure coal will be dragged down by preponderance of associated heavy material. The general character of the coal and the distribution of the impurities must for each case determine the desideratum in the matter of size. On the other hand, undue pulverization diminishes the purity of the washed product, and should be avoided.

The importance of properly sizing the crushed coal previous to washing has already been touched upon, and from what has been said of settling ratios it will be gathered that closeness of sizing is governed by the nature of the impurity. For pyrites alone, we need not screen very closely. The same is true, in lesser degree, of slate. Thus, the coal-washing plant of the Nova Scotia Steel & Coal Company, Limited, at Sydney Mines, N.S., using Luhrig jigs, lowers the ash in one grade of slack from 13.00-14.00 per cent. down to 3.5-4.0 per cent., using only three sizes—all under 3-4 inch mesh. This they are enabled to do because their ash is almost wholly derived from a good free slate.

On the other hand, the *School of Mines Quarterly,* Vol. XVII., No. 4, describes a Mexican plant where the best results are not obtained until six sizes are made, viz.:— 0 to 1-16 inch, 1-16 inch to 1-8 inch, 1-8 inch to 1-4 inch, 1-4 inch to 3-8 inch, 3-8 inch to 1-2 inch, and 1-2 inch to 3-4 inch. The impurities in the coal operated upon are so interwoven that there are present in the crushed coal particles of all degrees of gravity. Hence the settling ratios are small, and this close sizing is necessitated.

The various existing types of crusher and screen need not here be touched upon. Nor need we repeat the elaborate descriptions of the different coal-washing machines that have from time to time appeared in industrial journals. Each manufacturer naturally claims the palm for his machine, and can usually furnish columns of figures showing the results obtained by it in actual practice. These representations are in most cases, doubtless, fair and correct; but it is to be regretted that they are so seldom accompanied by adequate information regarding the character of the coal operated upon. It should be remembered that for every seam of coal there are certain possibilities as regards purification; that these possibilities, both qualitative and quantitative, can be accurately and positively determined by a series of calcium chloride separations, without the expenditure of a single dollar for coal-washing machinery; that a good washer should come only a little short of maximum possible purity as determined in this way, and that the best machine made can not surpass it.

Coal-washing devices employing water as a separating medium—not including elutriators—may be classified as follows:—

A. Surface current washers.
   1. Water stirred.
      (a) Intermittent, *e.g.*, the simple trough washer.
      (b) Continuous, *e.g.*, the Elliot trough washer.
   2. Mechanically stirred.
      (a) Intermittent, *e.g.*, the Scaife trough washer.
      (b) Continuous, *e.g.*, the Campbell bumping table.

B. Hydraulic washers.
   1. Continuous current, *e.g.*, the Robinson washer.
   2. Pulsating current, *e.g.*, all forms of jig.

The trough washer represents the most elementary effort to purify coal. It is simply a long inclined wooden trough, with perpendicular sides and a flat bottom, across which cleats are fixed at regular intervals. Water and coal are supplied together at the top of the trough. Impurities sink and are caught on the cleats, or "riffles." The water current, regulated by the inclination of the trough, carries the pure coal on over the lower end. At stated intervals operation must be stopped, or the flow of coal and water deflected into a second trough, while the riffles are being scraped out. Such an arrangement, when carefully and honestly tended, has been known to give admirable results.

The Elliott trough is similar in principle, but the fixed riffles are replaced by an endless chain of movable riffles, or rather scrapers, travelling from bottom to top of the trough. The water is admitted at the upper end, and the coal at a point midway between top and bottom. The pure coal is carried over the lower end as before, while the dirt is carried over the head of the trough by the scrapers.

The Scaife trough is an inclined trough of semi-circular cross section, two feet in diameter and twenty-four feet long, with fixed transverse riffles. The trough is longitudinally traversed by a rocking shaft carrying stirring fingers, which aid the water in agitating the coal and settling the impurities. When the riffles are full, coal and water are stopped, the trough is dropped from one side and the refuse dumped. It is then swung back into place, and operation resumed.

The Robinson washer is a wrought iron vat, in the shape of an inverted cone. Vertically in the centre of this vat stands a shaft carrying four stirring arms, whose field of revolution occupies the upper part of the vat. A continuous stream of water under considerable pressure is admitted at the bottom. Coal is fed into the open top. The slate sinks, and is discharged from time to time by means of a pair of sliding gates. The clean coal is carried over the lip of the vat with the water.

It will be observed that all types so far described operate for the most part on a free settling basis.

Under the jigs we include all machines in which the segregation of the heavier and lighter particles is accomplished by a pulsating current of water. The most rudimentary form of jig would consist of a box, with screen bottom and open top, sliding freely, with a minimum clearance upwards and downwards in an outer box filled with water. Coal, screened to the desired size, is charged into the inner box, which is then moved sharply downwards and upwards in the water by means of suitable cranks and driving rods. On the down stroke the water from the outer box rises through the screens and forms a sorting column, in which the coal and impurities are arranged according to their several settling ratios under hindered settling conditions. This phase is known as pulsion. When the inner box is raised again the water retreats from it, giving rise to the alternate phase of suction (which, by a suitable arrangement of valves, may be replaced by an interval of rest). If now we steadily supply raw coal to one side of the inner box, and continue the alternations of pulsion and suction, the operation becomes a continuous one, the pure coal is crowded over the lip of the inner box on the side opposite to the feed side, while the slate may, in any one of several ways, be continually removed from the bottom. Exactly the same result may be arrived at by fixing the sieve and causing the water to pulsate by means of a suitable arrangement of plungers. Numberless varieties of jig, mainly of the fixed sieve type, are manufactured and successfully employed in coal-washing. The most important differences are in the control, in the manner of removing the sludge, and in the arrangement of the jig bed, both in itself and with reference to the other beds. They are all only more or less complicated exemplifications of the laws of hindered settling.

Any size of particle may be treated in a jig, always provided, of course, that the particles jigged at the same time are of the uniformity prescribed by the settling ratios. For large fragments, a long, slow stroke is required; for smaller ones, a shorter, quicker stroke, *e.g.*, for coal passing a 1 1-2 inch screen and stopping on a 1 inch screen, 60-90 alternations from 2 inches to 3 inches in length are necessary per minute, while for sizes from 1-16 inch to 1-8 inch, about 140 alternations of a length from 3-8 inch to 1 inch would be required.

It remains now to describe the Campbell bumping table, a coal-washing device which, in seeming contradiction of all that has been said of the laws of settling, completely does away with the need for preliminary sizing. The contradiction, however, will be seen to be apparent only.

The *modus operandi* of the Campbell table will perhaps be best explained by a reference to the coal-washer of the Dominion Iron & Steel Company, Limited, of Sydney, N.S., where this type of washing machine has been successfully employed since September, 1904. The first of the accompanying illustrations shows the washery building, with the breaker towers at either end. Each tower contains a Bradford breaker and a roll crusher. The Bradford, as here installed, consists of two concentric drums, revolving about a horizontal axis. The inner drum is a screen, eight feet in diameter, and cylindrical in shape. Its meshes are one inch square. The outer drum has from feed to discharge end a gradually increasing diameter, with a mean of eleven feet, and is perforated with 3-8 inch round holes. The interior wall of the inner drum is provided with cast iron fingers, arranged in spiral rows. Mine-run coal, conveyed by belt from the receiving bins to the top of the tower, is fed into one end of the inner cylinder. As the breaker revolves, the pure coal, completely shattered by its own fall, passes wholly through the inch screen into the space between the two drums. All coal stopping on the 3-8 inch round holes is sent to the rolls, which are set at 1-8 inch, and thence to the washer bin. All coal passing the 3-8 inch holes goes to the washer bin direct. The larger fragments of slate, splint and pyrites, on the contrary, remain for the most part unbroken, and, aided by the arrangement of the cast iron fingers, are presently shot out at the discharge end of the inner drum as "breaker coal." The breaker, therefore, besides disintegrating and to a certain extent classifying the coal, effects a preliminary purification which is a very valuable adjunct to the washing.

Thus, a coal of the character operated upon at Sydney, contains as it enters the breaker, perhaps 6.50 per cent. ash and 2.50 per cent. sulphur. It leaves the breaker tower as a crushed coal, with perhaps 5.00 per cent. ash and 2.00 per cent. sulphur.

This is one of the reasons why mine-run coal is preferred in such instances to bankhead slack, which, besides containing higher initial sulphur and ash, cannot be benefited by the breaker, but must go straight to the washer without preliminary purification.

The washer proper comprises two independent units, each consisting of a battery of 24 bumping tables, arranged side by side, in line—a crushed coal bin extending over the entire length of the battery—water tower, sludge tanks, two concrete draining bins for washed coal, washed coal elevator, and conveying belts and accessories. Each unit is fed from its own breaker tower, and has a capacity of about 100 tons of washed coal per hour. A fair idea of the operation is given by Figures 1 and 2, which, although diagrammatic, are reasonably accurate as to scale.

E.—Fig. 1—is the table proper, shown in more detail in Fig. 2. The table is suspended from two pairs of rods, N and N, so that it swings freely in a practically horizontal plane in the direction of its long axis; and, being actuated by the cam arrangement O, is caused to bump against the post F.

The crushed coal falls steadily from the bin A through a vertical chute to the screw conveyor B, which delivers it into the trough C. The coal feed is controlled by the speed of the screw conveyor, and by a sliding gate in the chute just above B. In the trough the coal meets a stream of water from the supply pipe D, and, thoroughly mixed with it, falls upon the table. The water supply is further augmented by the spray pipe K, which, by means of a deflector, throws a fan-shaped stream across the width of the table.

The table is just sufficiently inclined towards the coal receiver H to determine the water wholly in that direction, but not enough to enable the water of itself to carry the coal over with it, *i.e.*, if the bumping stops the water still flows to H, but the coal settles on the tables. The bumping of the table against F throws all the heavier particles of impurity, against the water current, towards the sludge box G. At the same time, at every bump, the water on the table is carried backward, part of the way towards the sludge end, stirring the coal thoroughly, and on its return flowing over the coal end in sufficient volume to carry the pure coal with it to the receiver H, whence it is conveyed in sluices to the draining tanks.

These broad statements regarding the performance of the table upon material not closely sized will now be gone into a little more fully. The table (Fig. 2), which may be considered as a trough of varying depth, with perpendicular side walls and open ends, is 29 inches wide and 9 feet long. Beginning at the right hand (which in the sketch is the washed coal end of the table), is a tail board 10 1-4 inches wide, whose length is the width of the table. This is followed by 37 riffles, of the form shown in the longitudinal section (Fig. 2). The body of the riffle is of wood, with a projecting edge of galvanized iron. Following the riffles is a head board, 17 1-2 inches wide. Riffles Nos. 1-29, inclusive, are open riffles, *i.e.*, they are set about 3-32 inches apart, leaving between each riffle and its neighbor a slot which communicates with the space between the bottom of the riffle, and the false bottom C, of galvanized iron. This space, as shown by the arrows, opens on the sludge end of the tables. Nos. 30-37 are closed riffles.

The rationale of the operation is as follows: The stream of coal and water from the trough C (Fig. 1), strikes the tables about riffle No. 25. The bumping promptly imparts to each particle on the table an impulse towards the sludge end. Only the heaviest particles, however, can cope with the water, whose prevailing tendency is towards the coal end. As a result, the coarser impurities are caused to migrate to the sludge end of the table in a series of hops, which are shorter or longer, according to their size. Behind them, in the species of settling basin formed by the greatest depth of the table, a three-cornered arrangement goes forward between the coarse coal, the fine coal and the fine remnant of impurity. Every particle upon the table strives, by virtue of its gravity, to come to rest in the riffles On a perfectly fresh table the coarsest coal may possibly for a short time be on even terms with the impurity, but only a few fragments of the former are necessary to fill the riffles once and for all, and after the first few moments all additional coarse fragments are crowded out and must, perforce, move on. The fine coal particles, unable to sink in the briskly agitated water, are carried over into the coal received. Only the fine impurities, settling in the interstices of the coal, are caught by the iron edge of the riffle, ooze through the slot, and, falling upon the false bottom, make their way back unopposed to the sludge receiver.

Tests were made some months ago upon one of the Dominion Iron & Steel Company's tables, with a view to gathering some general information with regard to what might be termed the "ballistic ratios" of coal with reference to slate, etc., under working conditions. While the table was in regular operation a number of fragments of coal and marble of assorted sizes were dropped among the coal and water in the trough, and their deportment was observed. Marble was chosen, because its gravity is not very far from that of slate, and because of its distinctive color. The various experiments were repeated times enough to eliminate chance error, and it was proven:—

1. That every pure coal fragment weighing not more than 125 grams. (sp.g. 1.29), went regularly over the coal end. Slightly larger pieces still went to the coal end, but stuck in the shallow part of the table, about riffle No. 2. Still larger sizes travelled towards the sludge receiver.

2. That all limestone fragments stopping on a sieve of 10 meshes to the linear inch found their way to the sludge end, while smaller particles sank in the riffles, or at least did not come over the head board during the period of observation.

3. An examination of the sediment in the various riffles showed that all pyrites stopping on a sieve of forty meshes to the linear inch had been thrown over with the sludge, and that practically all pyrites finer than this, and all except the finest of the slate, had fallen between riffles 17 and 8, at the deepest part of the table, while the remaining riffles, 7-1, rising towards the coal end, retained the last of the slate, the contents of the last riffle consisting chiefly of pure soal.

Numerous comparisons of the regular work of this machine, with the results of calcium chloride separations made on concurrently taken samples of the same crushed coal, showed the work done day by day to be almost ideal, both as to quality and yield of product.

Equally successful work could, of course, be done with any good jig washer if the screening were sufficiently close; but screens wear rapidly, and, in spite of the most careful watching, the mesh becomes gradually larger and the sizing ineffective, so that, strictly speaking, maximum efficiency is only obtained when all the screens are perfectly new.

In the case of the bumping table, no such difficulty presents itself. The table has a long life and requires little in the way of repair, all the variables are under practically perfect control and can without difficulty be maintained constant.

In short, once regulated, the washer is doing its best work if it is running at all.

We have thus endeavored to treat, in a very general way, a few points suggested by the questions we originally propounded, laying emphasis on some details which are too often overlooked; and, in conclusion, while admitting that laboratory reports on industrial processes are often of doubtful and even negative value, we nevertheless venture to hope that the laboratory investigation of coal, as a determinant of its possibilities in the way of purification, may in future obtain more nearly its meed of appreciation.

In Cumberland, England, coal seams under 4 feet are worked almost exclusively by long-wall, and seams above that thickness by bord-and-pillar. However, the long-wall system has been adopted in several of the thicker seams, and it may be used in all cases where conditions are favorable. The yield is larger by long-wall and a higher percentage of round coal is obtained. The thickest seam at present worked by long-wall is 5 feet.

In France collieries are not worked on the pillar-and-stall method. The pillars are always taken out in their entirety, so that no coal is left in the workings; but during the first working "in the whole" the Mine Administration may require that the size of the pillars be increased.

PROSPECTING IN UNGAVA

J. C. Murray.

(Continued from page 112.)

An examination of Cotter's Island, the most northerly of the Nastapoka group, completed our summer's work. It had been arranged that we should meet the steamer "Algerine," carrying our winter supplies and building material for our winter quarters, about September 5th, at a point sixty or seventy miles north of Bell's Harbor. It was now the 5th of August. We had, therefor, ample time to sail up to the Hopewell Islands, choose our winter quarters and then run still further north on a short exploring excursion. On August 7th we anchored in Hopewell Sound, near the mouth of the Kongut River. Investigation of the surrounding country led to the choice of a spot on the north bank of the Innuksuak River, as a suitable location for putting up our buildings. In our ramblings here we came upon patches of blueberries growing on miscroscopic bushes.

LANGLAND RIVER FALLS.

After a short cruise north beyond Cape Dufferin, we returned to Innuksuak River on August 17th. Here we laid out the ground for our winter home and began excavating. Our only tools were gold pans and drill steel. However, the soil was loose and sandy, and we made surprising progress. By the time the foundations were well under way and a landing stage, built of flat stones carried by boat from an island five miles distant, was completed, the steamer "Algerine" appeared, ten days ahead of schedule. This was August 25th. By August 29th lumber, provisions, fuel and all sundries had been removed from the "Algerine," and we had dimensions 33 feet by 17 feet, which was to be our dwelling, and another of 30 feet by 16 feet, to become mately our storehouse.

UNLOADING WINTER SUPPLIES AT PORT HARRISON.

The "Algerine" left us on August 31st, taking one of our party along with her.

WINTER QUARTERS—PORT HARRISON.

The middle of September saw our large dwelling house almost completed. By early October a small laboratory, a kitchen (both opening into the main dwelling), a large storehouse, a dwelling for the Eskimos, a substantial workshop and one or two small outhouses were entirely furnished. Our three Eskimos displayed extraordinary skill in carpentry, easily excelling our own poor efforts. As may be supposed, we did not observe union hours during construction.

THE YACHT "ALLE."

The autumn was abnormally mild. Not until September 30th did the thermometer drop to freezing point. Early in September waveys appeared, flying south in

large flocks. Our Eskimos replenished our larder with many of these edible birds. Delicious salmon trout, firm of flesh and delicate of flavor, were caught at the river mouth in abundance. White owls, also, were often on our bill of fare. These birds were captured by a singular device. Short posts were driven into the ground at some distance from the dwellings, and on these were set No. 2 steel spring traps without bait. The owls, in their delight at seeing a possible perch in that treeless country, flew literally into the trap. The flesh of these birds is sweet and entirely pleasant. Ptarmigan were shot by the dozen, and so throughout the autumn we fared sumptuously.

Early in October we hauled our yacht out of water and housed her in. In November, analytical work was started in the laboratory. As winter had now set seriously in, making ample amends for the mild autumn, it was necessary to move all the re-agents that would be affected by the cold, out of the laboratory at night

TENT OF ESKIMO CHIEF, KOMINWAK.

and place them in a small frostproof cellar. Iron ore samples, taken during the summer, were crushed in a small hand-power jaw crusher, ground to uniform size and analyzed.

The absence of several important re-agents made one or two analytical operations very cumbersome However, many iron, manganese, silica and sulphur determinations were performed. Numerous qualitative examinations were also conducted. Later in the next spring we made a long series of gold and silver assays, using a small gasolene tank furnace.

In the first week of December our Eskimos banked the dwelling house. They cut huge blocks of snow and built them carefully about the house as far as the eves of the roof. Several families of northern Eskimos had now settled in their snow-houses near us. On Saturday evening they gathered in the main room to hear the phonograph. Eskimos were constantly calling at our post on their way north and south. The season was a phenomenally good one for foxes, and already much bartering had been done. White foxes were so plentiful that it was not at all uncommon for four or five to be trapped in an afternoon within a few miles of our winter quarters.

Our winter days, under the direction of our leader, were carefully filled with work, exercise and amusement. Drafting, laboratory work and compiling notes usually occupied the mornings. In the afternoon we took long runs on skis, sometimes after ptarmigan, more often after fox. The evening was devoted to reading, writing and occasionally to bridge whist. Plenty of good food and a great deal of outdoor exercise kept us cheerful and healthy. During bad weather in January, 1902, when extended travel was impossible, we took our exercise by tunnelling for many yards in a huge snowdrift that had formed on the north side of our dwelling.

In February a micrometer survey was made of the shore line about our post, which we had, incidentally, christened Port Harrison. February proved a much milder month than January. The average temperature during December had been 1 degree below zero. January's average was 12 degrees below zero, with a maximum of about 54 degrees below.

We had last heard from civilization in August, when the steamer had brought us letters that had been written in the previous June. Now, March 14th, an overland dog-packet came in from Great Whale, a long and arduous jurney, carrying very welcome letters, written to us many months before.

On March 15th two of us started south in dog-sleds for Nastapoka Islands, to finish surveying and locating claims.

(To be continued.)

The McMurtry-Rogers Process of Desulphurizing Copper Ores and Matte

Communicated by T. C. Cloud, Member.

(A Paper read before the Institution of Mining and Metallurgy, London, Eng., April 18th.)

The ore may be of any size from 2 1-2 inch gauge down to fine slimes, but preferably the largest pieces should not exceed 1 inch gauge, nor is it advantageous that the charge should consist entirely of slime ore.

The charge must contain silica or silicious material amounting to from 15 to 35 per cent. of silica and from 15 to 25 per cent. of sulphur, but the precentages of these substances may be somewhat greater or less without very materially affecting the operations of the process, it being also essential that the charge is wetted.

With ore direct from a dressing plant the amount of water present is usually enough, but when deficient the charge can be wetted while being mixed, or while being charged into the converter; enough water should be added to make the material cohere when slightly pressed.

From experience gained in working the process, the charges which burn best consist of—roughly—one-third of pieces about 1 inch to 1 1-4 inch gauge and two-thirds of fine ore from jigs, buddles or tables. When jigged ore and slimes, or slimes only, are treated, the charges take longer to burn.

The converters used for burning the ore, which have been installed at the Wallaroo Works, are cast iron pots mounted on trunnions and inverted by means of a worm and wheel, the inside diameter being 8 feet 8 inches by 4 feet 6 inches deep, the false bottom slightly convex and placed about 10 inches from the lowest part of the converter; it is perforated all over with 5-8 inch holes. Originally these false bottoms were made of cast iron, but it was found better to use wrought iron plates,

strengthened with angle irons underneath, these bottoms being held in position by a bolt passing through the centre of the pot.

The blast pipe enters at the back of the pot under this false bottom and is 8 inches in diameter.

Such a pot would hold eight to nine tons of wet ore.

The *modus operandi* consists in first covering the false bottom with pieces of a previously burnt charge broken to from 3 to 4 inch size, then lighting a small fire in the middle of the pot on top of this burnt material, using a light blast to urge on the fire, then charging the ore on top of this fire till the pot is about half full; after increasing the blast, and when the ore becomes more or less red in several places, the balance of the charge is added till the pot is full.

To start the fire a few chips of wood kindled by any ordinary means are used, and when these are burning well, sawdust is charged in on top till the whole fire is covered, allowed to burn a short time, then more sawdust is added wherever the fire appears.

By starting a small fire in this way in the middle of the pot and slightly coning up the sawdust, it drives the fire out in a circle towards the edges of the pot.

When the ring of fire has reached about one-third to half the diameter of the pot the ore is charged in on top, the first being put on with a shovel, so as not to scatter the fire too much, but after a layer has covered the whole of the bottom the ore is then fed in by an elevator from the feed bins below, being spread by a man over the surface in such a way that when the pot is half full the ore is piled up more at the sides than in the middle, presenting a concave surface; the reason for this being that the fire has a tendency to make for the sides rather than up through the middle.

For some time coal was used, or a mixture of coal and fine coke, but sawdust was found to answer better, as the fire was not so hot.

When the pot is about half full and the charge distributed as stated, a number of holes are pricked near the centre, a slight distance down into the charge, with a 1-2 inch rod; the object of this being to give more or less free vents for the uncombined sulphur and sulphur dioxide to escape and so quicken the burning.

These holes must be closed in before the fire burns through, otherwise blow-holes would be formed; the man in charge soon learns to tell when the fire is getting near the top of any hole by the color of the smoke given off.

During the spreading of the charge the blast is usually turned off to enable the man to work comfortably, and after the holes have been pricked half blast is given for about an hour, being then increased to full pressure.

The full pressure of blast used is 13 ounces, but it can be largely increased if necessary; over 20 ounces has been used, which latter pressure quickens the time of burning. The volume of air used per minute at this pressure for each pot is about 1,000 cubic feet.

Each pot has to be covered by a hood in order to take off the fumes, a connection being made from the hood to a flue, or a large pipe taken out from the top of the hood through the roof of the shed.

When the evolution of sulphur dioxide slackens and the charge has become red hot throughout, the blast is turned off, the blast pipe disconnected and the converter inverted.

In order to break up the sintered material more readily the cake is allowed to fall on some four or five cast iron cones, which help to split it into smaller pieces; these being subsequently cooled on the outside with water, and further broken up to a suitable size for smelting operations.

When the cones are not used the cake as a rule turns out of the converter in one solid block weighing over six tons (with the exception of a little loose unburnt ore on the surface), and even the fall to the ground is often not sufficient to break it.

The time taken to burn a charge varies with the mixture of ore used, but eight to twelve hours is the usual time. If the charge contains fully one-third of its bulk in pieces of 1 inch to 1 1-4 inch, well distributed, the time is often eight hours or under, but, as previously stated, with all fine material a longer period for burning is required. Like all converter pot processes, it pays to have the burning well looked after, to see that the blow-holes are stopped as they form, and also to allow as many holes as possible for the escape of free sulphur; by looking after these two points the time of burning can be materially reduced.

The shape of the converter pot has something to do with the successful burning of the charges. The first large pot used for experimental purposes was an old lead refining kettle with a hole at the bottom for the blast and a false bottom about 2 feet 6 inches diameter.

In burning ore charges in such a pot the difficulty was to get the ore near the sides alight, and in order to help this, sticks of wood about 18 inches long were put into the charge when the pot was a little over half full, radiating from the centre towards the sides; these as they burnt formed holes for the air to come up and so cause the ore near the sides to burn; with the proper pots installed for the ore treatment the sides are very much straighter, being for some distance at an angle of 14 degrees only from the vertical, and no sticks are required with them.

The product obtained consists of a porous sintered mass of ferrous silicate containing shots of rich copper regulus and free silica (ferric oxide only being observed on the outside of the cake), and forms a most suitable material for blast furnace treatment; the bulk of iron being in the ferrous condition renders it fit for slag formation without having to be first reduced from the higher state of oxidation.

The difficulties in treating fine-dressed ores of copper by first calcining and then smelting are well known to copper metallurgists, one of them being the heavy mechanical loss which occurs in the calcining operations, and again in the charging of the reverberatory furnaces with the hot calcines; true, these two sources of loss can be minimized by the use of good dust chambers and long flues, but even then the flue dust is not the easiest thing to re-treat.

Another difficulty is that the calcined ore is not suitable for smelting in a blast furnace, so that reverberatories must be used if there is much of this material to be treated, and in large works the two methods of smelting are frequently employed; the blast furnace for the rough ore, and the reverberatories for the fine.

These two difficulties are overcome by the use of the sintering process, as the loss is small owing to the ore being wet; the only time any dusting occurs is if a blow-hole is allowed to go unchecked, and this is seen at once and can be stopped; then the product can be smelted in either a blast furnace or a reverberatory; with the latter, however, it has to be broken up smaller than for a blast furnace.

The elimination of sulphur is as good as is obtained by most calcining processes for copper ores, and if the sintered product were smelted alone, without the addition of some uncalcined ore, the regulus produced would be too high for good work.

The result of a sample from a large pile waiting for blast furnace treatment gave 5.65 per cent. of sulphur; other results have given under 5 per cent. of sulphur from raw ore containing about 20 per cent. of sulphur and 10 to 12 per cent. of copper.

The presence of lime or compounds of lime is not essential to the working of the process.

The first experiments were made during 1904, and at the present time the plant which has been installed at Wallaroo is treating from four to five hundred tons of ore a week. At this point mention should be made of the help received from one of the writer's metallurgical assistants, Mr. S. Radcliff, in making the process the success it is at present.

The cost of desulphurizing by this process, including the cost of breaking up converter product for smelting, is only slightly higher than that of calcining rough ore of similar composition in pyrites burners.

Regulus or Mattes.—In treating these products the addition of some silicious material is necessary in order to take up the iron contained and form ferrous silicate; the proportions to be used are, preferably, from 15 to 25 per cent., but these may vary considerably. The silica may consist of such materials as coarse sand, jigged tailings, silicious carbonate ore, silicious oxide ore, and even silicious sulphide ore, such as dressed ore from buddles and Wilfley tables, has been used. The regulus should be crushed to pass a screen with meshes of from 1-2 to 3-4 inch square; with some mattes the larger screen should be used, but with hard low grade mattes it is better to take the 1-2 inch size.

The silicious material must be well mixed with the crushed matte or regulus, and the whole wetted to the same extent as with the ore.

In actual work it has been found better to take more trouble in charging the converters than is necessary in the case of ore, the best method being to add a few shovels full at a time over any part of the charge where the fire is showing through, until the pot is full.

The starting of a regulus charge does not need as large a fire as in the case of ore, and very good results were obtained by using the lead kettles previously mentioned for this work, starting the fire with a little wood and sawdust on the top of the rough pieces of burnt material; the pots which are in use for the burning of rich regulus or "regule," to be subsequently described, were also found to give very good results in matte burning, as the product, being smaller, was easier to break up than the large cakes obtained from the lead kettles.

With matte it is not necessary to prick holes in the charge, there being no free sulphur to eliminate unless sulphide ore is used to mix with the matte.

The product of the reaction is normally ferrous silicate, with a little monosulphide of iron and sulphide and silicate of copper.

A little metallic copper may be formed owing to reactions occurring between oxides of copper and sulphide of copper.

When the charge contains a moiety of oxidized ore, a fair proportion of copper is reduced to the metallic state; this, however, does not decrease the speed at which the desulphurization takes place.

The blast used must not be too high, 6 to 8 ounces being enough at first, as the lower layer next to the fire is apt to run up to too high a temperature if a greater pressure is maintained at starting; the pressure can, however, be increased towards the end to the same extent as with the ore.

The product after inverting the converter may be broken up and melted down in any suitable furnace, with the production of a very rich regulus and more or less metallic copper.

Owing to the difficulty of sampling such a product, and to the fact that some of the sulphur is in the form of sulphate, which in melting reacts with unchanged sulphide, no assay was done for sulphur in this product, but the result of the work is soon seen when the material is smelted, and gives a better guide than any assay would.

On burning matte assaying 25 to 30 per cent. of copper with one-third its bulk of silicious slimes, the product on melting gave regulus assaying from 64 to 67 per cent. of copper. With richer mattes the result was better, and in most cases it was necessary to add a certain amount of raw matte to the charge in order to keep the regulus produced on melting only just over 70 per cent.

Using the lead kettles as converters, a charge of from 6 to 7 tons of a mixture of matte and silicous material could be burnt in nine hours, and at times three six-ton charges were treated in twenty-four hours per pot, or eight hours each.

"White Metal" or "Regule."—The most satisfactory results obtained were with "metal" assaying from 78 to 80 per cent. of copper, that grade known as "spongy regule" being the best, owing to its porous nature.

This material is not easy to calcine in any form of furnace, great care being necessary owing to its low fusing point; in fact, it is seldom calcined except where the so-called "direct process" is carried on, and from experience gained in calcining it for this process, the difficulties and great cost of such calcination were amply proved.

By using the converter process for this operation the same end is obtained as far as the subsequent refining is concerned, but the troubles in the calcining are largely overcome and a more suitable product obtained for charging into the refining furnaces, and, the material being in lump form, less loss from dusting results.

Against this, more slag is produced than is the case with the Nicholls and James process, but the elimination of the impurities is decidedly better than is obtained by treating "regule" by either the ordinary Welsh roasting process or the Nicholls and James process; this latter fact is of great importance where the better classes of copper are required, as, for instance, "Best Selected."

In treating this material the regule is crushed to 5-8 inch gauge and only wetted with water, no silica being required, as the product operated on is nearly free from iron and consists of practically pure copper sulphide, Cu_2S.

The iron pots used for this are much smaller than with either ore or regulus, and are mounted on trunnions in a carriage running on rails. These pots are conical, being 5 feet 3 inches at the top, 11 1-2 inches at the bottom, where the blast pipe enters, and 3 feet 6 1-2 inches deep; such pots will each hold about two tons of regule.

The method of working is to light a small fire on the false wrought-iron plate with which the pot is provided, and then put on some well-burnt pieces of product from a previous charge, broken up to about 3 to 4 inch gauge; these pieces consist (as will be seen later) of almost pure copper; when they have become a dull red and the fire has burnt low, the wet regule is tipped in from a tram until the pot is half to three-quarters full, a low blast being then turned on (about 6 ounces), and when the

charge has burnt through in several places the balance of the regule is added.

It does not matter how wet the regule is that is being treated; water has been seen running out of the bottom of the pot before now and yet the charge has burnt well; the chief difficulty is to get the men to keep the fire small enough in first charging; if too hot a fire is used the regule, which melts at a very low temperature, simply runs and blocks up the holes in the false bottom, so preventing the air from getting through.

These charges take about eight hours to burn, the blast pressure used being from 8 to 10 ounces only; when high pressures are employed the regule melts and so stops the process.

The final product obtained consists essentially of porous metallic copper mixed with oxide sulphate, and some unchanged regule, and for some time the main trouble was to break up the mass; this, however, was overcome by using a heavy iron ball weighing about 16 cwt., which was hoisted up by a steam winch 20 feet high and allowed to drop on the sintered regule product; a few blows generally served to divide it into several pieces, which could be further reduced if necessary by the use of a sledge hammer and gad.

It is only necessary to break up the pots of sintered regule small enough to enter the side doors of the refining furnace to which the product is sent.

The fines which are made in breaking up, as well as any small amount of unburned regule, are put into a travelling hopper, which runs over one of the ordinary roasters, and is there converted into pigs of rough copper; this roaster taps beds of copper every twelve hours.

This method of treating regule comes very much to the same thing as adopting the so-called direct process of Messrs. Nicholls and James, except that the troublesome calcining of white metal is done away with; the product is better to handle, being mostly metallic copper; it is not necessary to have the samples run down to see when the right amount of calcined material is present; there is less loss in flue dust both in the calcining and refining; the product being in lumps is easier to melt in the refining furnace, and the quality of the copper is better; on the other hand, more slag is produced than in the direct process.

Some experiments were conducted as to the elimination of impurities from regule, using, 1st, the ordinary Welsh roasting process; 2nd, the direct process of Messrs. Nicholls and James; and 3rd, the McMurtry-Rogers process, and in the case of nickel and bismuth the following are the results. Taking the ordinary Welsh process as one, the ratio of elimination is:—

	Nickel.	Bismuth.
Welsh process	1.0	1.0
Direct process	1.5	1.12
McMurtry-Rogers process	1.87	1.39

Higher results than here given were obtained for nickel, but this is considered a fair average.

Experiments were also undertaken to see if the gas given off from sintering could be used for the manufacture of sulphuric acid, but, like all processes using an air blast in a converter, the gas varies considerably in composition.

The following are some of the results obtained:—

	SO_2.	O.
Gas from ore	5.4	8.0
"	3.0	...
" regulus	5.5	12.0
" regule (mean)	11.1	5.6

An experiment was conducted with gas from the regule by blowing it with a fan into the first chamber of the acid works, but although acid was made it caused trouble in other ways by reacting on the Glover tower and ore burners, so had to be given up; but it is quite possible that this could be used for the manufacture of sulphuric acid, if required.

Reactions.—When calculating the heat of combustion of sulphur-bearing materials—taking into account the heats of combustion of the metals present and heat of formation of silicates formed (if any), as well as the heat furnished by the sulphur—we find that even a very silicious mixture contains a sufficient amount of available energy to keep the temperature of the mass above ignition point, provided that the combustion takes place with sufficient rapidity to neutralize the unavoidable loss of heat by radiation. As a proof of this statement it has been found possible at Wallaroo to burn material containing only about 5 per cent. of sulphur and 5 per cent. of iron, with no more than sufficient fuel to start the combustion.

In ordinary calcining processes when the percentage of sulphur is low and the ore is fine, heat must be supplied from an external source to make up for the radiation losses. If it is attempted to quicken the combustion of ore in sulphur by blowing air through it, a very large amount of dust is produced; but when the ore or crushed product is wetted the mixture can be desulphurized to any extent required in practice and with great rapidity; the water added plays a very important part in the process and cannot be dispensed with.

The mechanical effects of the water in holding the upper portions of the charge together, and so preventing dusting, is obvious. There are other effects caused by the water which are not so apparent. In the first place, the wet mixtures used conduct heat badly and so keep up the temperature at the seat of the combustion and cause this zone to move upwards as a fairly horizontal layer. The products of combustion also leave the surface of the charge from a large number of points distributed all over the surface.

(To be continued)

It is difficult to estimate the amount of potential power lost in the form of waste coke-oven gas. But it has been calculated that, assuming an oven is carbonizing at the rate of 7 tons a day, the waste gas from such an oven would be equal to about 40 horse-power in a gas engine.

Platinum metals have a very curious relation to mercury. So long as the sodium amalgam is rich in sodium they amalgamate perfectly, but as soon as the sodium is spent the platinum metals leave the amalgam and will not remain combined with it.

The hydraulic method of working auriferous gravels, with or without the "giant," delivers a stream of water and gravel to the upper end of a long set of sluice boxes which have riffle blocks along the bottom. As the water and gravel rush along, the heavy grains of gold, platinum, magnetite and other heavy minerals settle into the crevices or riffles between the blocks. The gravel, which has been deprived of most of its values and heavy grains, goes off the lower end of the sluices as tailings.

ONTARIO FELDSPAR

According to the Ontario Bureau of Mines' Report, recently issued, the production of feldspar is increasing. The output of the Richardson mine, owned by the Kingston Feldspar Company, is now about 130 tons per day. No. 1 pit at this mine, on the southwest side of the quarry, has a depth of 75 feet and an area of 250 feet by 50 feet. No. 2 pit, on the northeast side, has an area of 300 feet by 50 feet and an average depth of 50 feet. A shaft 30 feet deep has been sunk between No. 1 and No. 2 pits, and the water drains from the pits to the shaft, where a No. 10 Cameron pump raises it to the surface. The feldspar in No. 2 pit is dipping to the northwest under the body of quartz which appears on the surface.

The Jenkins mine, near the Richardson, has been closed for the last year.

At Border mine, in the Township of Portland, feldspar is being taken out of an open cut some 200 feet long, 20 feet wide and 25 to 30 feet deep. The dike of feldspar runs in a northeast by southwest direction, and cuts across the gneiss formation. Bodies of quartz are found in the dike.

The Kingston Mining & Development Company also work a mine in Portland Township. This open cut is 200 feet long by 25 feet wide and 8 feet deep. The feldspar occurs in a large pegmatite dike, and is the predominant mineral in that part of the dike being worked. The dike occurs cutting a dark gneiss.

EVALUATING COAL

In *The Colliery Guardian* (London, England), for April 12th, is a report of the monthly meeting of the Manchester Geological and Mining Society. During the meeting Mr. W. H. Coleman gave an exhibition of the new calorimetric bomb, and explained its use in ascertaining the value of coal. The bomb is made of steel, of such a thickness and shape that it will stand a pressure of more than 200 atmospheres. Before explaining how the bomb is worked, Mr. Coleman spoke on fuel valuation in general, treating the subject under three heads: (1) Sampling of the fuel, (2) determining its calorific value, and (3) comparing different fuels to find out which will serve the purpose in hand most economically.

As to the first point, the chief difficulty in the way of determining the calorific value of a fuel was the fact that it was not at all easy to obtain an average sample, and unless the sample was what it professed to be—unless its composition was the same as that of the whole bulk of the fuel under question—it was useless to waste time and money in making elaborate calorimetric determinations.

Mr. Coleman then pointed out the necessity of obtaining a large original sample of coal, under the everyday conditions of shipment. A cart load, after thorough mixing, should be quartered down to 100 pounds; great care being taken to preserve the right proportions of lump and fine. The sample was next crushed and again quartered to 2 pounds or 3 pounds. This quantity was then crushed to a moderately fine powder. The whole of these operations should be done as rapidly as possible.

Three ways offered themselves for determining the calorific value. First, an ultimate analysis of the coal might be made and its theoretical calorific value calculated. This, though accurate, took a considerable time, and required the services of an expert chemist. Second, the moisture, ash, volatile matter and fixed carbon might be estimated and the calorific value calculated from one of the numerous formulæ given by different authorities. This simple method, though useful in checking deliveries, the calorific value of which had been accurately determined before, was not sufficiently accurate to discriminate between several different qualities of coal.

In addition to the calorimetric determination, the length of flame, the quality of the ash and other factors must be taken into account; but, given several samples of coal, all of which are otherwise suitable for the intended use, the most economical coal can be selected by the calorimeter.

THE LEGEND OF THE FIRST PROMOTER

In ages prehistoric,
When legends allegoric
Were the only kind of substitute for papers,
The Son of Tubal-Cain,
In language crisp and plain,
Was instructed to abstain from silly capers.

For that sinful son of Tubal
Said: "I know that every Rube 'll
"Want to buy a share in Eden's only venture."
(He had found a chunk of gold
Where Euphrate's waters rolled,
And he straightway started in to merit censure).

'Twas to Adam first he went,
And the case he did present;
He recited how in fooling on the margin
Of the river he had seen
That yellow golden sheen;
And Adam said, "You're sure you're not enlargin'?"

So it ended up in this,
That Adam said: "I wis
"I'm up to buying shares in something good,
"But, grandson, by your leave,
"I'll consult with Mother Eve—
"She's sewing leaves together in the wood."

And the consequences were
(For the man persuaded her),
Poor Adam gave a mortgage on the Garden;
And the Son of Tubal-Cain
His only was the gain,
And the sons of men are working yet for pardon.

But Tubal-Cain himself,
He scorned the dirty pelf,
And he spoke in accents scathing to his son:
"Since this wicked world began
"I'm the first Straight Mining Man."
And he smote him for the thing that he had done.

And Tubal spake again—
Very shame did him constrain—
"To think that I have bred a d—d promoter;
"I'm a plain blunt mining man,
"And if I conceived a plan,
"I couldn't talk one-half enough to float her."

Now of schemes there were no more,
In those misty days of yore,
Till Noah and "Consolidated Ark";
But his venture paid because
All the water outside was—
And the Son of Tubal-Cain did not embark!!!

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

East Kootenay.

The recent cessation of work in the coal mines of the Crow's Nest Pass is causing much anxiety throughout the mining districts of Southern British Columbia particularly, and generally in the other parts of the Province which depend on the Canadian Pacific Railway for their transportation facilities. At the time of writing no arrangement, not even a temporary one, has been made for a resumption of work by the coal miners, pending investigation by the Board appointed under the Conciliation Act lately passed by the Federal Parliament. The following press despatch from Fernie, where the operators and miners are now discussing the points at issue, will serve to show the seriousness of the position so far as it affects the industries directly concerned:—

"The number of men affected by the strike directly, and in the other trades and industries dependent on the immediate supply of coal, is conservatively estimated by a prominent mining official here as 15,000 men; that is, smelters, supply men, miners and train crews.

"Dealing with the coal mining industry in the Pass alone, the following are the names of the mines affected, estimated number of men employed and the daily output of coal and coke:

"In British Columbia.—Crow's Nest Pass Coal Company's Coal Creek mine—850 men, 2,300 tons of coal and 300 tons of coke. Michel mine—450 men, 1,500 tons of coal, 250 tons of coke. Total—1,300 men, 4,800 tons coal, 550 tons coke.

"In Alberta.—International Coal & Coke Company's Coleman mine—400 men, 1,500 tons of coal and 250 tons of coke. Canadian-American Company's Frank mine—275 men, 600 tons of coal, no coke. Hillcrest mine—175 men, 450 tons of coal. West Canadian Collieries' Lille mine—300 men, 600 tons of coal and 30 tons of coke. Bellevue mine—175 men, 450 tons of coal. Total—475 men, 1,050 tons coal, 30 tons coke.

"Brekenridge & Lund Company, Dundbreck mine—75 men, 200 tons of coal.

"Galbraith mine—20 men, 50 tons of coal.

"Pacific Coal Company, Bankhead mine, anthracite coal—550 men, 1,200 tons of coal.

"McNeil Company, Canmore, anthracite coal—275 men, 500 tons of coal.

"Total—3,400 men affected, 9,000 tons of coal daily, and 1,100 tons of coke."

Rossland.

An advance of wages of 25 cents per day is to be given to shovelers, carmen, ore sorters and surfacemen employed in Rossland mines, as from May 1st, inst. This will bring the wages of men so engaged up to $3 per day, instead of $2.75, the rate heretofore paid in Rossland camp. Men similarly employed in Boundary district mines have long been paid at the rate of $3 per day. The companies agreeing to this advance are the Consolidated Mining & Smelting Company of Canada, owning the Centre Star War Eagle group of mines; Le Roi Mining Company, owning the Le Roi and Black Bear, and operating under bond the Spitzee mine; the Le Roi No. 2, owning the Josie and No. 1 mines; and the White Bear Mining Company, owning the mine of that name. The letter from the mine managers to the executive of the Rossland Miners' Union, acceding to the request for the advance abovementioned, also intimated that no other increases would be made. It stated that: "In view of the fact that the ores of Rossland camp are low grade, containing low copper values, and, therefore, affected only to a small extent by the increased price of that metal, making it difficult to carry on operations at a profit, it would be distinctly understood that in thus meeting the views of the men employed by the undersigned they have done the utmost possible to do, and that further requests for increased pay cannot be considered."

Similkameen.

The Daly Reduction Company has resumed operations at its 40-stamp mill at Hedley. As yet there is not sufficient water flowing to give power enough to run all the stamps, but as the season advances and the snow melts the number dropping will be increased until the mill shall be running at full capacity. In connection with the Nickel Plate mine, which supplies the mill with ore, the air compressor is working and both electric and gravity tramways that between them connect mine and mill are being operated. Those in charge of mine, mill, etc., are:—G. P. Jones, mine superintendent; E. A. Holbrook, general superintendent of lower works and cyanide plant, and A. Clare, in direct charge of stamp mill, vanners, etc.

It is announced that Chas. Camsell, of the Geological Survey Department of Canada, will spend the ensuing field work season in the Similkameen, continuing the geological work he was engaged in last year. The object of the work is a topographic and geologic survey for a sheet to embrace the whole of the Similkameen district.

Vancouver Island.

The Tyee Copper Company is now receiving more custom ore at its smelter at Ladysmith than at any previous time since it commenced smelting operations. For two or three years it has employed Mr. W. M. Brewer as its ore buyer, and he has paid particular attention to the gradually developing lode mining fields in Southern Yukon and Southeast Alaska. At length tangible results from his assiduous attention to that field are being obtained, in the shape of regular shipments of copper ore from mines on Prince of Wales Island and other northern mining camps. The Britannia Smelting Company is also receiving much ore from the Mount Andrew mine, Prince of Wales Island, in addition to its customary large shipments from the Britannia mine on Howe Sound, distant about 60 miles by water from the smelter at Crofton, V.I.

Coal mining continues active at the several collieries of the Wellington Colliery Company and the Western Fuel Company. The former is operating the Wellington (Extension) and Comox (Cumberland), Collieries, each with three or four mines, and the latter the No. 1 Shaft, Protection Island Shaft, and No. 4 Northfield mines, all in the neighborhood of Nanaimo. The coal measures in all three districts are extensive; those already explored are known to contain large reserves of coal, sufficient to supply for many years even a larger annual output than that of recent years. There is beside a considerable area of country known to be coal-bearing which has not yet been prospected. Preliminary figures of production in 1906 (the annual statistics have not yet been published by the Provincial Bureau of Mines, so are not available) showed: Western Fuel Company's mines, No. 1 Shaft and Protection Island, 290,000 tons; No. 4 Northfield—a newly opened mine—83,700 tons; total, 373,000 tons. Wellington Colliery Company's mines, Cumberland, 409,000 tons; Extension, 381,000; total, 790,000. Total gross output of Vancouver Island coal mines, 1,163,700 tons. Beside its coal sales, the Wellington Colliery Company sold last year between 17,000 and 18,000 tons of coke, made at its ovens at Union Bay, Comox district. The foregoing production figures are given with the object of conveying an adequate idea of the extent to which coal mining is carried on by Vancouver Island collieries. So great has been the demand for coal for several months that this year's output to date will probably be found to have been larger than for several years last past, if not greater than for the corresponding period of any previous year in the history of these coal mines.

General.

The Government of British Columbia has decided not to give its assent to any prosecutions under the Lord's Day Act, so the Attorney-General stated in the Provincial Legislature just before

it was prorogued on April 25th. It is understood that the members of the Eexecutive Council of the Province gave the matter their careful consideration and eventually came to the conclusion that conditions prevailing in British Columbia differ so much from those obtaining in Eastern Canada that in their judgment it would be best to take advantage of the optional power the Act gives Provincial Attorney-Generals to refuse assent to prosecutions under its other provisions. It will follow, therefore, that the interruption to carrying on the mining and smelting industries of this Province, as in the past, will not take place, as has been prematurely suggested it would. Incidentally it may be mentioned that some of the larger mines have for several years been in the habit of suspending all mining work on Sundays.

The hearing of the extra-lateral rights mining case of Star vs. White by the full court of British Columbia has been concluded, and judgment has been reserved. This cause, in which defendant is being sued for a large sum of money as compensation for ore taken from the claim of plaintiff, has been before the courts for about sixteen years. About two years ago the Chief Justice gave judgment in favor of defendant, but last year plaintiff secured an order from the full court directing that certain additional work be done, and W. E. Zwicky, manager of the Rambler-Cariboo mine, Slocan, was appointed by the court to supervise the doing of this work. Both sides called experts to pronounce upon the result of this work—for the plaintiff, Frank L. Sizer, of Helena, Montana, and S. S. Fowler, of Nelson, B.C.; for the defendant, Max Boehmer, of Denver, Colorado, and W. J. Elmendorf, of Spokane, Washington. The recent hearing occupied the attention of the full court for about a fortnight, and as the amount involved is $500,000, its judgment is awaited with more than ordinary interest. The mines concerned are adjoining properties in the vicinity of Sandon, Slocan.

The Provincial Legislature has passed an Act providing for an eight-hour day for smelter employees, as under:

"No person shall be employed in or about any smelter, sorting, handling, removing or smelting ores or matte in any stage of preparation for a longer period than eight hours in any twenty-four hours.

"Any owner, agent or manager, or anyone acting on their behalf, employing any workman or person in contravention of this Act, shall be liable to a penalty not exceeding one hundred dollars for each workman or person so employed, and any workman or person so working for a longer period than specified in section two of this Act shall be liable to a penalty not exceeding one hundred dollars nor less than twenty dollars.

"Twenty-four hours for the purposes of this Act, shall mean midnight to midnight.

"This Act shall come into force on the first day of March, 1908."

ONTARIO.

Algoma.

Very favorable reports are coming in with regard to the copper mining prospects of the Dean Lake neighborhood, which is now being extensively prospected and opened up, and which, from all accounts, appears to be one of the richest copper districts in Algoma.

A promising-looking property, known as the Allan Eckel Mine, has recently been opened up by some Toronto people, and a good showing of ore is reported, while several other good prospects have been located. The Jury Company are finding an exceedingly good showing, one portion of their vein at a depth of 20 feet carrying two feet of almost solid ore. Their property consists of 320 acres, and the vein which they are now working extends almost continuously for 1 1-2 miles, with a width of 8 to 16 feet.

The Northern Ontario Company are also going steadily ahead and are raising good grade ore. They are now employing about thirty men on their workings.

Mr. T. Hayes Sheen, general manager of the Copper Mining & Smelting Company, of Ontario, Limited, has now returned from England. He has obtained an option on the Bruce Mines & Algoma Railway, which it is intended will be extended from Rock Lake, 16 miles north of Bruce Mines, to join the C. P. R. main line, thus opening up a very rich mineral country. If this extension is carried through important developments may be looked for in the mining industry in Algoma.

Cobalt.

The resignation of the Hon. William Templeman from the presidency of the Airgiod Cobalt Mining Company lends color to the oft-repeated rumor that he is soon to accept an appointment as Minister of Mines in Premier Laurier's Cabinet. While Minister of the Interior he felt perfectly free to take an active interest in this important enterprise, and it is probable only because he feels that as the head of the Government's Mining Department he should have no connection with private mining enterprises that he retires from the position. While the corporation regrets the loss of Mr. Templeman's services, there is much satisfaction that Hon. L. Melvin Jones, of Toronto, has been willing to take the presidency in his place. The vacancy thus occurring on the Board has been filled by the choice of Hon. James Ross, formerly Commissioner to the Yukon, who becomes chairman of the Executive Committee.

Frequent reports are made of important finds at the mines lying at the foot of Cobalt Lake, and extending around to the west of the railroad. During the past week rich veins were found at the Trethewey and the Buffalo, and during one night over $6,000 worth of ore was taken from the most recently discovered vein at the Townsite, although the plant is as yet running at but one-half capacity. These mines are all in a direct line with the La Rose, Nipissing, McKinley-Darragh and other properties that rank as the most valuable in camp.

The possibilities for the development of these mines, as of all others in this district, are good, as has been shown frequently in the past. Among the many odd stories of the unexpectedly rapid increase in values is that O'Brien, whose name is borne by one the biggest mines in the camp, once offered his property in exchange for a carload of horses valued at $2,100. He has since been offered and has refused $6,000,000 for what he once thought was of so little value. It has also been figured out that $500 invested in Hudson Bay stock three years ago would now amount to $186,000, in addition to several thousands in dividends.

Work on the development of the Airgiod property is progressing rapidly, and Mr. Askwith, the engineer in charge, believes the plant will soon be in full operation. A complete outfit of machinery has recently been received, and is now being installed. In the meantime hand work has been pushed, and only last Saturday a discovery of smaltite very rich in silver was made in shaft No. 9.

Work has begun upon the development of the property of the Sutton Bay Silver Cobalt Mining Company, located at Sutton Bay. Lots No. 1 and No. 2 will be opened up at once under the supervision of Mr. Rupert Simpson, who was formerly in charge of the Townsite Mine.

Mr. A. T. Budd, who has just returned from a visit to Toronto and Ottawa, states that the Cobalt Native Silver Company has practically decided to begin active operations toward the development of its property in the second concession of Bucke Township, adjoining the Thompson and Annex claims. He thinks a small plant will be purchased and started on the 10 inch vein of galena.

Mr. Joseph Houston, chief engineer at the O'Brien Mine, is getting everything in shape to turn over to his successor, for he is soon to take charge of the Right of Way property, where a much larger plant is to be installed as soon as delivered.

Mr. William S. Mitchell reports a recent valuable discovery in one of his properties in James Township. This is on one of the discovery claims of the district, and is among the nest of claims

composed of the Munroe, Saville and others, which Mr. Mitchell has incorporated into the "Elk Lake Mines, Limited."

The Temiskaming Mining Company shipped a carload of ore last week which will undoubtedly be a record-breaker for richness. Their vein from which it was taken is one of the richest in the district, and was struck at the eighty-foot level, and has given great encouragement to those who expect their values to increase with depth.

Mr. M. T. Culbert, of the O'Brien, has returned from an extended trip through Mexico, where he has been examining and reporting on silver properties.

On Wednesday evening, May 1st, the first regular meeting of the local branch of the Canadian Mining Institute was held in the Prospect Hotel, Chairman Cole presiding. A paper, which was read before the Mining Institute in Toronto by Prof. Van Hise, of Wisconsin University, entitled "The Geology of the Cobalt District," was read. The animated discussion showed how interesting the geology of this district is to the mine managers, and many new points were brought out. Interest was given to the meeting by the presence of Prof. Brock and Capt. Tyrell, who gave interesting addresses. The next meeting will be held on the first Wednesday in June.

A magnificent new vein was discovered last week on the Buffalo property. This property, under the able mangaement of Mr. Jones, has developed into one of the big things of the camp.

Mr. R. W. Leonard, president of the Coniagas, accompanied by Mr. Peak, of the North American Cobalt Smelting & Refining Company, of Thorold, were in town for a few days last week.

The towns in the mining district are fast assuming city airs, and both Cobalt and Haileybury can boast of clubs.

The Cobalt Club has secured very comfortable quarters in the Exchange Building, where they have two flats, consisting of billiard room, reading room, smoking rooms and card rooms, all furnished with mission furniture and decorated in excellent taste. The club now boasts of a hundred members, and it is the intention to erect a building of their own, with dining room and all the conveniences of a city club. At the annual meeting, held on 27th April, the follwoing directors were elected:—F. H. Marsh, manager Imperial Bank of Canada, Cobalt; S. H. Logan, manager Canadian Bank of Commerce, Cobalt; C. B. Flynn, of the Colonial Mining Company; George Ross, barrister, Cobalt; J. McConnell, manager Green-Meehan Mine; manager of Government mines; J. Lorne McDougall, barrister, Cobalt. The new Board are all quite enthusiastic, and the future success of the club is assured.

The Haileybury Club is another organization which tends to afford some social advantages and comforts to the bachelors of Haileybury, and probably to a number of benedicts, at present homeless in their search for the white metal.

Kingston, Ont., is to be the site of the smelter of the Stanley Smelting Works. The Kingston Council has granted the company a free site of five acres. A four hundred ton concentrator and an aerial tramway are to be installed at the company's mine. For the smelter, Kingston, with its admirable harbor, should be an excellent site.

Eight inspectors will be sent by the Ontario Government to Cobalt and Temagami districts and the outlying country, to investigate claims and confirm or cancel discoveries.

The Ontario Department of Mines, recognizing the difficulty of carrying on development work under the severe conditions of this very protracted cold weather, has decided to exclude the period between April 15th and May 15th in computing the time within which work or mining operations are required to be performed by the Mines Act on any mining claims covered by working permits, in order to prevent forfeiture.

Nova Scotia.

Springhill.—A short description of Springhill may interest some at least of your readers. Springhill is essentially a mining town. A town of one industry—coal mining. It is a city set on a hill, several hills. It is a common saying that to leave the postoffice to go anywhere *in the flesh* you go uphill. The postoffice, the largest and most important public building, occupies a central position in the town. The building is of brick, and is rather a handsome structure. It is the hub, so to speak, of a wheel, formed of stores and other buildings, save toward the north, where the Cumberland Railway & Coal Company's reserve lands permit an uninterrupted view for miles towards Shepody Mountain range. The northern frontage of the town runs parallel to the crop of the working coal seams, following its various windings. This irregularity in the outcropping of the seams takes the form of an S in the three and a half miles of developed working. From the centre of this distance for probably a mile the line of strike is east and west, nearly. On the east it makes a gradual curve to the north, while the west side curves very decidedly to the south for a long distance. The town, in consequence of following the gyration of the outcrop, appears from a north view to be built in a semi-circle, the west end being suddenly rounded off to the south. There are no dwelling houses, therefore, built over the workings, or possible workings of these seams. To the north are the mines and their extensive and up-to-date surface plants, the railway, the various sidings and branches, and the railway buildings. To the east, south and west is the town, which owns the distinction of being the highest mining town in Nova Scotia, its elevation being 600 feet against the 216 feet credited to Westville, of Pictou County. In the matter of population, a few years ago Springhill was the most populous mining town in Nova Scotia. But Springhill to-day must give place to Greater Glace Bay, in Cape Breton, and possibly to Sydney Mines. The population of Springhill is in the vicinity of 7,000. There is one thing, however, I think Sprinkhill leads in. This is the workmen's ownership of land and houses. Of Springhill it can be said that for a town of but one industry there is none in the Province, possibly none in Canada that contains so many residences owned by workingmen. There are over 1,300 dwellings in the town. In ordinary mining towns a large proportion of the mining men are housed by the operating companies. On the tenant roll of the Cumberland Railway & Coal Company there are about 180 tenants. As the company has on its pay roll, at the present time, 1,700 names, it is at once apparent that the company has made no provision for housing a very large majority of its employees. There are, comparatively speaking, very few houses in Springhill built for the purpose of renting. So it is very evident that by far the largest number must be owned by the occupants, who are in the company's employ. In building, in recent years, the tendency is to get back from the works, the town extending east, south and west. The buildings are mostly of wood, the exceptions being the Postoffice, Town Hall and Academy of Music, which are of brick. The Technical and High School Building to be constructed this year will also be of brick. Springhill is a very healthy place as a rule; but is subject to epidemics, as a recent experience has shown. The town has a magnificent water supply, of the very best quality, brought in by gravity from a lake distant some seven miles to the south of the town, on the notrhern shed of Maccan Mountain range. The cost to the town was approximately $180,000, but this was money well expended. With the splendid water supply, however, we have no sewer system. To this fact are attributed the frequent outbreaks of typhoid fever and various ills. Especially is the north side of the town affected, the fall of the ground being towards the north. The open drains, with their accumulated impurities, make ideal breeding places for all sorts of disease germs. This condition will soon, however, be changed. The city fathers are getting busy over the question of sewerage, and decided improvement is looked for this year. There is one other thing this town can boast of, and that is good roads. It was not always so, but with the discovery of red stone as a macadam, an era of decent streets began, and for years past we have enjoyed the driest and cleanest streets of any town in the Province. It may not be out of place to remark that this red stone is a product of the mine. Rock

and fire clay from tunnels and roof strippings, slate, shale, splint, coal and wood refuse are sent up out of the mine, dumped in a huge heap, and this accumulates for years. It ignites through spontaneous combustion. It smoulders and burns until anything of a combustible nature is burnt out. There remains but a diminished heap of hard rubble, bright red in color, with not a particle of anything in it that makes for mud. This material, when spread a foot deep on the worst road, will stand years of the heaviest hauling without serious rutting. When placed on foot paths it will attain the smoothness and solidity of cement without the clothes-destroying dust that rises from the cement sidewalk. Although the red stone does not "make" in sufficient quantities for an extensive export trade, some hundreds of tons have been purchased by our progressive shire town of Amherst for street macadam. Springhill is somewhat noted in other ways. According to the population, it has more churches and other religious institutions, more societies, more clubs, more children, more schools, more *strikes* (to its credit or otherwise) than any mining town in Canada.

I will later give a description of the surface plant and collieries that may be of some interest.

GENERAL MINING NEWS

British Columbia.

The British Columbia Copper Company, operating at Greenwood, will presently install a cyanide plant of 500 tons per day capacity at the Napoleon Mine, Pierre Lake district, Washington. The Napoleon claims are two miles from Boyd's Station, on the Great Northern.

What is probably the first carload of coke ever imported into Canada from New Zealand will soon arrive in Vancouver on the steamer Pardo.

In the Lillooet district, B.C., the Alexandra Hydraulic Company are prosecuting work vigorously on Alexandra Creek, a tributary of Bridge River. The company has endeavored to induce the Government to construct a bridge across the Bridge River at Jack's Point.

On Sunday, April 21st, the Dominion Copper Company's Boundary Falls smelting plant was blown out. This was directly a consequence of the coal miners' strike.

Under the regulations governing the disposal of Dominion lands within the railway belt in the Province of British Columbia, coal lands may be purchased at $10 per acre for soft coal and $20 per acre for anthracite. Not more than 320 acres may be acquired by any one individuel or company. Royalty at the rate of 10 cents per ton of 2,000 pounds is collected on the gross output.

The Sudbury group of mines, not far from the Mother Lode and Sunset groups, in Deadwood camp, is being taken up by James Schiene, of Spokane.

The Ellemar copper mine, in Prince William Sound, in Southwest Alaska, has been sold to H. C. Elliott for $1,000,000. Mr. Elliott is president of the Hubbard-Elloitt Copper Mines Development Company. The mine was one of the first locations made in Southwest Alaska.

In the last week of April the erecting engineer of the Jenckes Machine Company and the Canadian Rand Company, turned over the new plant recently installed in the Idaho property to the Dominion Copper Company. The plant has since been operating smoothly. The compressor furnishes air for the Brooklyn, Idaho, Rawhide and Stemwinder mines, and operates two diamond drills and three pumps. It is a Rand type, and was manufactured in Sherbrooke, P.Q. It has a rated capacity of 25 drills, and is driven by a 450 horse-power Canadian Westinghouse electric motor. The current is taken from the South Kootenay Power Company's high tension hydro-electric lines, being brought from Bonnington Falls, on the Kootenay River, some 75 miles distant. To furnish the Rawhide with compressed air, a six inch pipe line was laid for more than a mile.

To illustrate the effect of the car and fuel shortage and the severe weather conditions of last winter, a comparison of the output of refined copper from the ore of Boundary mines, during the first quarter of 1906 and of the same period in 1907, may be made. For the first three months of 1906 the quantity was 7,500,000; for the first quarter of 1907 it was 5,000,000.

The Rambler Mine, in the new working between levels 7 and 9, is developing a vein of rich ore. A series of new stopes on each side of the 1,350 foot shaft is being started. New bunk-houses are being built and hoisting machinery installed.

Ontario.

On the Big Ben mine property, Bucke Township, four new buildings, to accommodate 40 men, are now completed. An 80 horse-power boiler, a compressor and a steam hoist are to be installed.

The unsurveyed territory immediately south of Lorraine Township is reported by prospectors to be, at least, promising. The formation is principally conglomerate and conglomerate slate. It is said that gold, silver copper, galena and cobalt bloom have been found there.

Pulp Mill No. 1 of the Sault Ste. Marie Pulp & Paper Company was almost entirely destroyed by fire on April 24th. Overheated bearings are supposed to have been the cause. Two hundred men are out of employment. The loss is heavy, though partially covered by insurance, and it will likely require eight months to rebuild.

The Ontario Government has refused to grant liquor licenses except in towns and cities within 20 miles of the Transcontinental Railway.

The Laurentian Mine Company has advanced the pay of its drillmen to $3.25 per day; helpers, $2.90; carmen, $2.75.

Sixteen miles north of Bruce Mines, in Morin Township, a discovery of cobalt bloom is reported.

Ontario—Cobalt.

The Badger mine property, consisting of 80 acres, staked out by students of the University of Wisconsin, has been bought by an English syndicate. The purchase price is said to be about $1,000,000.

Kerr Lake is to be partially drained by the Kerr Lake Mining Company, with the object of exposing a considerable amount of the lake bottom for prospecting. The Silver Leaf Mining Company has granted permission to the Kerr Lake people to use part of their property as a building site.

The directors of the Coniagas mines have declared a dividend of 2 per cent., and notify shareholders that the intention is to declare 2 per cent. every two months hereafter. This is at the rate of 12 per cent. per annum, and on the $4,000,000 stock will take $480,000.

Nova Scotia.

The iron ore deposits of the Eskasoni and McPhee Mountains have been bought by an English company. The surface indications are good and an excellent harbor will afford shipping facilities.

A ten-stamp gold mill is to be erected at Middle River, Cape Breton.

At Dominion No. 2 Colliery, the explosive Alexite is being experimented with exhaustively.

The site has been selected for the new Sydney Rolling Mills. The property comprises 28 acres.

The new Bessemer converter was blown in at Sydney on May 1st.

It is stated that the Gowrie & Blockhouse Collieries Company has been absorbed by the North Atlantic Collieries Company, Limited. The capacity of the pit at Port Morien is 400 tons per day. This capacity is to be increased to 1,500 tons per day. One hundred and fifty thousand dollars is set aside to effect improvements. At Long Beach, a mile distant, another shaft will be sunk, and the shipping pier will be largely improved. Several

boats are to be chartered. The company controls about 36 leases, on which six seams of gold are known.

The Nova Scotia Steel & Coal Company are about to close a deal whereby they will acquire large deposits of iron ore in the interior of Brazil. Mr. Harvey Graham is conducting the final negotiations.

Ten stamps will soon be added to the five already in operation at the Beaver Hot gold mine. Mr. S. Clifford MacLean is the resident engineer.

The amount of coal shipped by the Dominion Coal Company from Louisburg during the past four months was 450,766 tons. About 335,000 tons of this amount was shipped to Boston and Portland, while the balance was distributed between Maritime and Gulf ports and Newfoundland.

A rich find of gold-bearing quarts has been made at Montague, near Halifax. It is supposed to be a continuation of the old Rose lead.

Belief is growing in the probable consummation of a merger of the Dominion Iron & Steel and the Dominion Coal Companies.

At a special meeting of the Pioneer Lodge of the Provincial Workmen's Association at Springhill, N.S., it was decided almost without a dissentient vote to refer the "Stone Trouble" with the Cumberland Railway & Coal Company, to a Board of Conciliation for investigation.

ALBERTA.

A seam of coal six feet in thickness has been uncovered near Strathcona.

Coal has been discovered within the city limits of Calgary.

ALASKA.

About the middle of April a general lockout and strike was reported at the Treadwell mines. The trouble is attributed to the poor diet provided for the workingmen.

BOOK REVIEWS

THE MINING MANUAL FOR 1907, by Walter R. Skinner, London, 11-12 Clements Lane, Lombard street, E.C. Twenty-first year of publication.

The information set forth in the Mining Manual is classified into three sections—Australia, African, and Miscellaneous, covering 1,135 pages. The pressent issue contains particulars of 3,054 companies, of which 410 are Australia, 1,033 African, and 1,611 miscellaneous. As in previous issues, alphabetical lists of mining directors and secretaries and a dictionary of mining terms are included. These are supplemented by a list of engineers and mine managers, giving the names of the companies with which they are connected. A remarkable amount of information is condensed within the Mining Manual. Its practical utility is at once evident from the mere mention of what a field it covers.

FIRE ASSAYING, by Evans W. Baskett, B.S., D. Van Nostrand Company, 23 Murray street, N.Y., pages 105, price $1.25. This is a most useful outline of fire assaying. The illustrations are numerous and well chosen. Particularly valuable are the chapters on "Reagents and Fluxes" and on "Laboratory Tests." Being written with the avowed object of clearly presenting the subject to persons of no technical education, it is simple, lucid and direct in diction and manner. The book should prove useful to those who wish to acquire rapidly a working knowledge of fire assaying.

PERSONAL

Mr. J. Dix Fraser has returned to New Glasgow, after an extended visit to England.

Mr. A. G. Burrows is among the newly appointed Ontario Mines Inspectors.

We regret to learn that Superintendent S. D. Madden, who has been in charge of the diamond drill work on Little Nipissing, is temporarily incapacitated owing to an accident. We wish Mr. Madden a speedy recovery.

Dr. A. E. Barlow was in Toronto on mining business on the 5th and 6th of May. He then left for Cobalt.

The Hon. Frank Cochrane, Minister of Mines for Ontario, has returned from a long visit to the Old Country, restored in health.

Mr. Nicholas Flynn has been appointed general manager for the La Rose Mines Company at Cobalt.

Mr. A. P. Low, Director of the Geological Survey, has returned to Ottawa from spending a few weeks in the South. We are glad to learn that his health is completely restored.

Mr. J. C. Haas, of Spokane, Wash, well known as one of the pioneer engineers of the Boundary district, where he has still large interests, recently visited the Cobalt district to report on properties for a syndicate.

The Dominion Coal Company is being sued by Mr. Austin King, formerly superintendent, for $85,000 for wrongful dismissal.

Mr. Frank Robbins has been engaged to report on placer deposits on the Colorado River.

Mr. R. R. Hedley has been commissioned by the Federal Government to report on the smelters and reduction works of British Columbia in connection with the work of the recently created Department of Mines. The appointment is an excellent one, and the authorities are to be congratulated upon securing the services of so well known a metallurgical expert to undertake the duty.

Mr. Thos. Kiddie, formerly manager of the Tyee Copper Company's smelter at Ladysmith, B.C., has assumed the management of the Alaska Mining & Smelting Company's smelter at Hadley, Prince of Wales Island, where it is proposed to install the Kiddie hot blast system.

STATISTICS AND RETURNS

The following figures give the ore shipments of three districts of British Columbia for the week ending April 27th, and for the year to date:—

Boundry shipments—

Mine.	Week.	Year.
Granby	19,836	178,060
Mother Lode	6,808	53,649
Brooklyn	1,440	23,643
Snowshoe	2,699	20,756
Rawhide	1,760	19,481
Sunset	736	8,004
Emma	303	3,021
Mountain Rose	140	1,803
B.C.	12	1,358
Oro Denoro	814	990
Idaho	384	896
Providence	74	467
Morrison	150	469
Strathmore	31	53
Duncan	21	21
Other mines	...	327
Total	35,208	313,000

Kootenay-Slocan shipments—

Mine.	Week.	Year.
Sullivan	600	9,600
La Plata	46	1,177
La Plata, milled	425	6,800
St Eugene	354	4,321
Queen milled	185	2,960
Second Relief, milled	145	2,330
Hunter V	107	1,546
Silver King	645	691
Queen Victoria	80	352
Last Chance	22	274
Sunset	31	74
Idaho	26	48
American Boy	18	18
Other mines	...	5,711
Total	2,684	35,902

The total shipments from the mines in the above districts for the past week were 43,375 tons, and for the year to date 326,143 tons.

Rossland shipments—

Mine.	Week.	Year.
Le Roi	2,974	40,211
Centre Star	1,414	25,288
Le Roi No. 2	386	6,645
White Bear	149	577
White Bear, milled	500	2,200
Other mines	...	2,320
Total	5,423	77,241

Cobalt shipments, week ending May 4th, 1907:—

April 30th—O'Brien Mine, to American Smelting & Refining Company, Perth Amboy, N.J., 64,640 lbs.

May 4th—O'Brien Mine, to American Smelting & Refining Company, Perth Amboy, N.J., 65,750 lbs.

May 3rd—Townsite Mine, Canadian Copper Company, Copper Cliff, Ont., 40,070 lbs.

May 3rd—Silver Queen Mine, Canadian Copper Company, Copper Cliff, Ont., 44,000 lbs.

May 4th—Coniagas Mine, American Smelting & Refining Company, Perth Amboy, N.J., 62,000 lbs.

Total, 276,460 lbs.

CANADA'S IRON PRODUCTION.

The pig-iron production of the Dominion is keeping pace with the growth of other industries. In thirteen years the increase has been about 1,200 per cent., an average of nearly 100 per cent. per year. In 1894 the output was 44,791 tons, and in 1906, 541,957 tons. The production of last year was double that of 1904, when the output was only 270,942 tons. The output per year since 1894 up to last year is given in the following table:—

1894	44,791
1895	37,829
1896	60,030
1897	53,796
1898	68,755
1899	94,077
1900	86,090
1901	244,976
1902	319,557
1903	265,418
1904	270,942
1905	468,003
1906	541,957

Last year there were thirteen blast furnaces in operation, and in 1905 there was thirteen during the first half of the year and twelve during the latter half. The outlook this year isexceptionally bright, and when the immense iron ore discoveries around Port Arthur are developed an ouput of at least half as much again as that of 1906 may be looked forward to.

The following figures give the approximate output and shipments of the Dominion Coal Company for the month of April:—

No. 1 colliery	35,925
No. 2 colliery	54,379
No. 3 colliery	33,360
No. 4 colliery	49,434
No. 5 colliery	72,858
No. 6 colliery	16,708
No. 8 colliery	20,038
No. 9 colliery	33,208
Total output	315,911
Total shipments	212,772

CATALOGUES AND OTHER PUBLICATIONS

The rapid advance of the B. F. Sturtevant Company, Boston, Mass., in the electrical field has been noticeable and is particularly marked at this time by the issue of their Bulletin No. 63, showing various types and sizes of generating sets. These range from 3 to 100 kw. in output, the smallest size being driven by a 3 1-2 x 3 vertical engine, and the largest by a 14 x 14 horizontal centre-crank engine. A separate series, ranging from 7 1-2 to 100 kw., is equipped with vertical compound engines. All the types of Sturtevant engines illustrated are completely enclosed and arranged with watershed partitions to prevent the water from the piston rod stuffing box reaching the interior of the frame. All interior bearings are supplied with oil under a system of forced lubrication, thereby securing a mechanical efficiency considerably in excess of 90 per cent. Many of these generating sets in the vertical, simple and compound types have been designed to meet the rigid specifications of the United States Navy Department, and their successful passage through the inspector's hands appears to be the best evidence of the standard which is being maintained by the B. F. Sturtevant Company.

Bulletin No. 12, from Mussens Limited, Montreal, illustrates their double cylinder, single drum mine hoists and cages.

A revised price list of sprocket wheels has been received from the Link-Belt Company, of Chicago.

Two very attractive catalogues have been received from the Robb Engineering Company, Limited, of Amherst, N.S. One, on "Steam Boilers," traces the evolution of the Robb-Mumford boiler. The Mumford boiler was designed by Mr. J. A. Mumford in 1885, primarily as a portable boiler for saw-mills, mining purposes, etc., when a light, compact boiler was required with internal fire box. With its large, round furnace it proved a great success. In 1889 an outer casing of iron was added and other improvements made with a view to securing the utmost possible economy of fuel. The present type was designed by Mr. Mumford in 1896. Improvements embodied in it provided for position circulation, larger margin of water line, prevention of scale formation, and facilitated the removal of scale and sediment. Further improvements were made in 1902. In construction the Robb-Mumford boiler is especially adapted for carrying high pressures of steam with safety. Another catalogue describes the design and method of manufacture of the now celebrated Robb-Armstrong engine, of which many types are made for every variety of duty.

"Merralls' Mills" is the title of a descriptive catalogue which comes from the Merralls Machinery Company, 1123 Broadway, corner 25th street, New York. The Merralls people manufacture an especially substantial stamp-mill with certain features which recommend it to all practical men. One of these features is the individual mortar. Each stamp also has its own ore feeder and water supply. Screens on all four sides of the mortars afford quadruple discharge and effectually prevent sliming. Each stamp may be hung up for cleaning, repairs, etc., without in the least interfering with any other stamp. A great increase of amalgamating capacity is claimed as compared with the five-stamp open mortar. The individual mortar tends to prevent flouring of the mercury. A short, fast drop of a much heavier stamp gives the Merralls' stamp mill a very large crushing capacity. Sectional mills are made, by this firm, that are easily transportable.

EXCHANGES.

The Coal Trade Journal for May 1st predicts a record-breaking year in anthracite output.

A history of British Columbia placers, past and present, is started in the May 4th number of the Mining World.

Many good papers, among them "Stoping Systems at Broken Hill," appear in Mines and Minerals for May.

"Preservation of Mine Timber from Decay" is the title of a leading article in The Engineering and Mining Journal, May 4th.

The February number of the British Columbia Mining Record is on our desk. A very readable paper on the British Columbia Copper Company's Greenwood smelter is contained in this number.

Mining and Scientific Press, April 27th, has an excellent description of "The Geology of the Meta Madre," written by the editor, Mr. T. A. Rickard. In this number the announcement is made that the Mining and Scientific Press has once again taken up headquarters in San Francisco.

The Colliery Guardian, April 19th, has been received.

The Mining Investor for April 29th has been received.

The Chemical Engineer, April 1907, contains an exhaustive summary of recent literature on asphalt.

Canadian Machinery for May has been received. Robert W. Angus writes on "Some Features of Large Gas Engines."

The Mining Reporter, April 25th, administer a mild reproof to the daily press of mining camps.

The Industrial Advocate, April, gives a full and well-connnected report of the proceedings of the Nova Scotia Mining Society.

The Engineering and Mining Journal, April 27th, presents a copiously illustrated description of some of the leading Cobalt mines.

No. 3, Vol. XXV., of the Proceedings of the South Wales Institute of Engineers. The technical papers given in this issue are of a very high order.

"Quebec Mining Law," issued by the Department of Colonization, Mines and Fisheries, Quebec, in the form of a neat, compact booklet, has been received.

A valuable paper entitled "The Blast Furnace Practically and Theoretically Considered" is given in Iron and Coal Trades Review, April 19th.

Among other articles of interest, one on the "Black Sands of New Zealand, the Pacific and Tierra del Frigo," appears in the London Mining Journal, April 20th.

The earthquake anniversary number of the San Francisco Mining and Scientific Press (April 20th), in an incisive and cogent article, deals with the "Requirements of Modern Mining."

The Engineering Magazine for May has its usual number of first-class technical articles. "The Technical Student and the Engineering Apprenticeships Course" is worthy of careful perusal.

Compressed Air for April contains an account of a novel use of that substance. An ingenious New Yorker has discovered that compressed air can be used to good effect in quelling a storm at sea.

In the Mining World, April 27th, R. T. Hill writes on the "Geology of Sierra Amoloya, Mexico." A mine correspondent writes appreciatingly of Dr. David T. Day's work on the "Black Sands of the Pacific States."

COMPANY NOTES

In order to keep pace with the requirements of their increase in business, the John McDougall Caledonian Iron Works Company, Limited, of Montreal, have opened sales offices at the following places:—Montreal, 82 Sovereign Bank Building; Toronto, 810 Traders Bank Building; Winnipeg, 251 Notre Dame street; Vancouver, 416 Seymour street; Nelson, Josephine street; New Glasgow, N.S., Telephone Building.

Their principal products are waterworks equipment and all kinds of hydraulic and mill machinery.

The following new directors have been added to the Board of the Foster mine:—Mr. E. F. B. Johnston, K.C., Mr. Jos. Oliver, Mr. John Gowans Kent, and Mr. G. H. Doran.

The Ontario Gazette for the week ending May 4th contains the following list of new mining companies incorporated:—

The Ottawa Mica Mining Company, Limited, capital $350,000, head office Ottawa.

The Larder Lake Gold Hill Mines, Limited, capital $1,000,000, head office Toronto.

Imperial Consolidated Mining Company, Limited, capital $1,500,000, head office Toronto.

The Gilbert Consolidated Mining Company, Limited, capital $2,000,000, head office Toronto.

The Temagami Copper Company, Limited, capital $2,000,000, head office Toronto.

King Solomon Larder Lake Gold Mining Company, Limited, capital $1,000,000, head office Toronto.

Monitor Cobalt Prospecting & Developing Company, Limited, capital $500,000, head office Toronto.

Smaltite Silver Mining Company, Limited, capital $1,000,000, head office Toronto.

British Columbia.

Mounts Sicker and Brenton Olives, Limited. The annual general meeting was held in Victoria on April 16th. The financial statement submitted showed disbursements of $9,491.

METAL, ORE AND MINERAL MARKET

Aluminium, for No. 1 ingots—49 to 51 cents per lb.
Antimony—20 to 23 1-2 cents per lb.
Arsenic, white—7 1-4 to 7 1-2 cents per lb.
Barytes, crude—$11.25 to $14.50 per ton.
Bismuth—$1.40 to $1.50 per lb.
Cadmium—$1.40 to $1.46 per lb.
Carbons, for drills—$75.00 to $85.00 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, pure metal—80 cents per lb.
Cobalt, fo.b., Cobalt, Ont., unrefined—40 cents per lb.
Corundum—7 to 10 cents per lb.
Feldspar—$7.00 to $15.00 per short ton.
Flourspar, lump—$8.00 to $10.00 per long ton.
Graphite, domestic—$45.00 to $150 per short ton.
Gypsum, lump—$4 per long ton.
Infusorial earth, ground—$15 to $35 per long ton.
Lead—6 cents per lb.
Manganese, pure—75 cents per lb.
Mica, groud—$65.00 to $85.00 per short ton.
Mica, scrap—$13 to $15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 95 per cent. pure—21 cents per lb.
Nickel—45 to 50 cents per lb.
Platinum, ordinary metal—$32 per ounce.
Pyrite, 38 per cent to 45 per cent sulphur—11 to 11 1-2 cents per unit.
Quicksilver—$41 per flask of 75 lbs.
Talc—$15 to $20 per short ton.
Tungsten, pure metal—$1.35 per lb.
Tungsten ore, 60 per cent. pure—$400 per ton.
Tin—42 3-4 cents per lb.
Zinc sheets—$8.60 per 100 lbs.

MARKET NOTES.

American iron and steel market is firm. Pittsburg bessemer stands at about $23 per ton.

Copper is quiet, with an improving demand. Lake copper, 25 to 25 1-2 cents per lb.; electrolytic, 24 1-4 to 24 1-2 cents per lb. The London market is displaying an upward movement; standard, £106 15s. per long ton.

Tin.—New York, 42 3-4 cents per lb.; London, £195 10s. per long ton.

Lead.—New York, 6 cents per lb.; London, £20 6s. per long ton.

Silver.—New York, 65 1-4 cents per ounce; London, a fractional advance to 30 7-16d. Mexican dollars, 50 1-4 cents.

Spelter.—New York, 6.52 1-2 cents per lb.; London, £25 17s. 6d. per long ton.

The first reference to the occurrence of silver in Canada is found in a paper by General Baddeley, R.E., read before the Literary and Historical Society, Quebec, 1830, where the deposit of galena at Bay St. Paul is alluded to. The percentage of silver is not stated, but the quantity of galena was thought to be insufficient for successful working.

The argument formerly advanced against the use of forced draft instead of induced draft that it burns out the grates, seriously injures the boilers, and blows gas and smoke from the fire doors, is now seldom heard. The basis of this opinion originated in the experience of some engineers with plants equipped with fans operated at far above the proper speed. This was the result of installing (through ignorance), a fan too small for the work, and then forcing it above its normal speed in order to secure the desired air volume. As a consequence, instead of creating an ash pit pressure of 3-4 to 1 1-4 inches, which is all that is ordinarily required, the pressure was forced up to even 5 or 10 inches, with the attending objectionable results.

In one instance, the engineer complained of gas discharged from the fire doors with incidental effects, and condemned forced draft in toto, although he was favorably disposed toward induced mechanical draft. Investigation showed that the fan was being operated at about 12 inches water pressure, which at once accounted for all the trouble.

When forced draft is used, the air as it passes from the ash pits to the combustion chamber is greatly reduced in pressure, owing to the resistances of the grates and the fuel. Coincidently, the stack, even if a short one, tends to produce a partial vacuum in the furnace. As a result it is practically impossible to create under proper conditions more than a slight excess of pressure in the combustion chamber, and this should not be enough to force the gases out at the fire doors.

Accurate knowledge regarding the proper application of the fan blower for this purpose will readily dissipate any false impressions regarding forced draft.

BY THE LINES OF THE

Canadian Pacific Railway

All important points in Canada and the United States can be reached.

Fast Trains

To Quebec, the Laurentians, Eastern Townships, St. John, N. B., Halifax, Boston, Worcester, Springfield, Mass., New York, Portland, Me., and the principal Atlantic Seaside resorts, Kawartha Lakes, Toronto, Niagara Falls, Detroit, Chicago, Ottawa, the Temiskaming, Mississaga, French River, New Ontario, Sault St. Marie, St. Paul, Minneapolis, Winnipeg, and the Western Prairies, the Kootenay Mining regions, the Mountains of British Columbia—unrivalled for scenic grandeur—Vancouver and the Pacific Coast.

Fast Steamship Service

On the Upper Lakes, Owen Sound to Fort William, on the inland waters of British Columbia, on the Pacific Coast to China, Japan, Australia, via Honolulu and Suva, and to Skagway *en route* to the Yukon. The fastest and most luxuriously furnished steamers between Victoria, Vancouver, and Seattle, and on the Atlantic Ocean between Bristol, London, Liverpool, Montreal, and Quebec, in summer, and St. John in winter.

Double Daily Transcontinental Train Service

During summer months, and Daily Transcontinental Service during winter months.

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Heat Lost by Radiation—The amount of heat lost by radiation from the bare pipes containing steam at 100 pounds pressure has been estimated to be equal to two tons of coal a year for each 10 square feet of pipe surface. It has also been found that 88 per cent. of this loss can be saved by using Pipe Covering.

Engineers' & General Miners' & Mill Supplies

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Spring Catalogue will be ready for mailing by the first of March. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our Spring Catalogue for 1907 will be a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend.

Write for it now so as we can have your name on the list in time.

Underwood

If you use a typewriter at all, doubtless you use a visible writer—the other kind is obsolete. It may be that you have recently purchased some Underwood imitation for which strong claims were made; for instance, that the writing would remain in perfect and permanent alignment.

Everyone recognizes that the prime requisite of a typewriter is good work, and that good work necessitates accurate alignment. But no visible writer can possess this essential unless it has a guide at the printing point. The Underwood has the guide.

If you have a new Underwood-imitation, use it for six months. If it holds its alignment without the aid of the repair-man we will present you with the best typewriter made—an Underwood. Make the test; you stand to lose nothing, and—we feel quite safe.

The Deister Concentrator Co.

Fort Wayne, Ind.

Gentlemen:-

In response to your query of 15th. inst. as to my opinion of the Deister Concentrator I would say that in one or theother of our mills we have made extensive tests of most of the concentrating tables on the market. Iam free to state, however, that, in the treatment of our slimes, the Deister table has shown the best results which we have ever obtained. It is a good piece of mechanical design, repairs are practically nil, it weighs less, occupies less floor space and comsumes far less power than any other table of which I know. The results of tests made in our Baltic mill show for the Deister table, working on slimes, a higher percentage of extraction and a cleaner concentrate than we have hitherto been able to obtain with any table we have tested. The best testimonial we could give is the recent order received by you from us for twenty tables. I congratulate you on the successful culmination of your long and patient effort to improve the practice.

Yours very truly,
F. G. Coggin Supt.

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

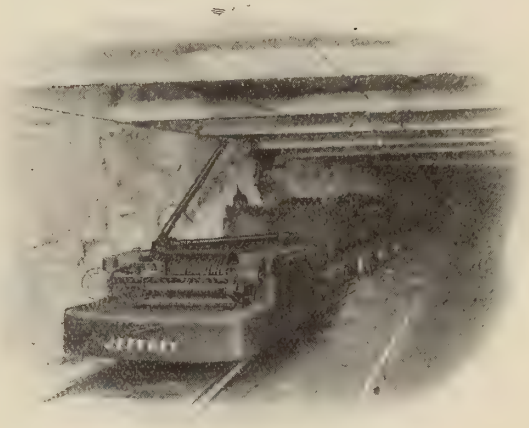
The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.



For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

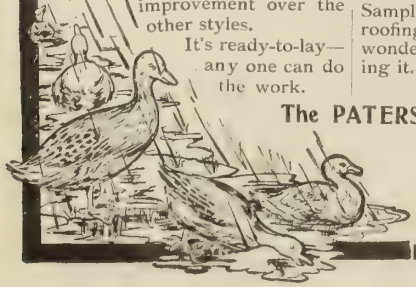
The Mineral Surfaced Roofing



Ever heard of Amatite? Well, if you haven't we want to tell you something about it. First of all remember the name—Am-a-tite.

It's worth your while because it is the real mineral surface roofing that everyone who sees buys. It's the winner in Ready-Roofings, and a vast improvement over the other styles.

It's ready-to-lay—any one can do the work.

It's rainproof, wind and weather-proof—outwears all other kinds, is less expensive, and, most important—it never requires painting or repairs.

That is a pretty broad claim, but we can back it up to the letter. But don't take our word for it. Send in your name and address to-day and we will send you the proof—an illustrated booklet and free Sample. Once you see the roofing itself you will not wonder why everyone is buying it. Write to-day.

Copies of the Mining Law and any information can be had on application to

The Hon. W. T. Pipes

Commissioner Public Works and Mines, - HALIFAX, NOVA SCOTIA

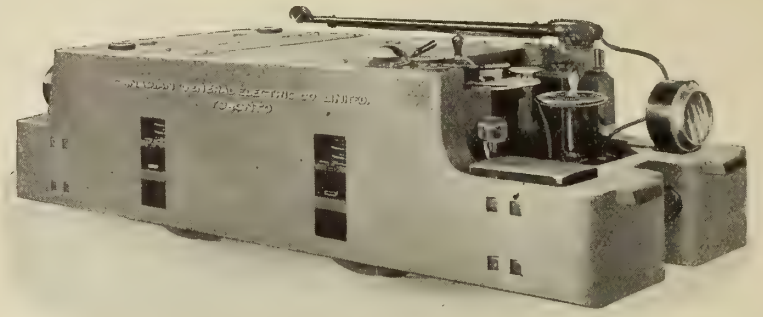
McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways – Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.



A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

NOTICE

Dishonest persons have been attempting to solicit subscriptions for the Canadian Mining Journal without authorization from this office. They have set the subscription rate at one dollar per annum, and have apparently "worked" several places, with what degree of success we cannot tell.

We wish to warn the public against these tricksters. Our agents are provided with papers and forms which are not obtainable by anybody not employed by us. It is an easy matter to detect an imposter. We shall be grateful if persons having knowledge of an offence of this sort will bring it immediately to our notice.

RECIPROCITY

There is need of systematic interchange of opinions and data between Canadian metallurgists and mining men. The Canadian Mining Institute affords an annual outlet to those having something to say in matters technical. There are, however, emergent problems, more particularly in the field of ore treatment and reduction, that require immediate attention. Take, as an example, the milling of gold ores. We could cite instances of two free-milling ores, identical in character, and being mined within a few miles of each other, receiving totally different treatments in the stamp mill. It is often the case that the stamp mill is designed, and its specifications are filled, not to meet the requirements of the ore to be treated, but rather to conform to the predilections or prejudices of the mill manager. Under circumstances such as these, loss is inevitable. Many a mine has been added to the list of failures because of just such unwisdom. Again, the concentration of ores (such as the ores of Cobalt) is a subject fraught with difficulties. Experience will teach many men different truths. Sooner or later a standard method of concentration for each class of ore will be developed—sooner, and with infinitely less expense to all concerned, if a frank interchange of experience be instituted; later, and at indefinitely greater cost, if each operator hugs his own small fraction of success.

Viewing the subject in general, it should be at once apparent that technical men engaged in any of the various processes of mining and metallurgy have nothing to lose and everything to gain by freely comparing notes at all times and seasons.

NOVA SCOTIA MOVES

While Nova Scotia is supplying her sister Provinces with politicians and the larger sort of educationist, and has been exporting professors to the United States, she has chosen for the head of her new Technical College a native of Cambridge, Massachusetts.

Mr. Frederick H. Sexton, whose appointment to the Directorship of Technical Education in Nova Scotia, and to the Principalship of the Nova Scotia Technical College in Halifax, has just been announced, has for the past four years occupied the chair of Mining and Metallurgy at Dalhousie College, Halifax. During these years he has succeeded in establishing a thorough and eminently practical course of instruction in those important branches. He has acquired, moreover, a knowledge of the peculiar conditions which delimit the industrial development of Nova Scotia, more especially as regards mining and metallurgy. With the initial advantages of youth, of a brilliant academic career at the Massachusetts Institute of Technology, and several years of research work and practical experience in previous appointments, Mr. Sexton is well furnished, professionally, for his responsible task. Further, however, Mr. Sexton, by the quality of his work, by his unwearying enthusiasm and by his unusual modesty, has won the warm friendship of all mining men. The Canadian Mining Journal extends to the new Director its heartiest wishes for all success. Nova Scotia has long needed such an institution as the new Technical College, and, we are confident, such a man to govern it as her newly appointed Director of Technical Education.

ASSAYERS

British Columbia points a moral for Ontario. In the former Province examinations for efficiency in the practice of assaying are held under the direction of a Board of Examiners. Persons wishing to practice as assayers must pass this examination before being granted a license. An entrance fee of fifteen dollars is charged, and successful candidates are called upon for an additional fee of fifteen dollars for their certificates. Candidates are examined on their knowledge of the principles of inorganic chemistry, of sampling, of the qualitative determination of the common elements in ores and furnace products, of assaying of gold bullion, copper bullion and lead-copper bullion, and of ores and furnace products. An adequate knowledge of the methods of analysis of coal, and of the standard methods of determining copper, nickel, iron, lead, lime, zinc, sulphur and silica, must be shown. The candidates are also examined in mineralogy. Graduates of certain Schools of Mines and Colleges are exempt from examinations, and may receive a certificate of competency upon payment of the fee. The examinations are largely practical.

It will thus be readily seen that British Columbia does not recognize as an assayer a man who can merely determine the amount of gold in an ore. The Province very wisely demands that certificated assayers must display a thorough familiarity with all the ordinary processes of qualitative and quantitative analysis. Candidates who come up to the necessary standard are very likely to be men of intelligence and honesty. We venture the statement that had the Province of Ontario exercised the same precautions in restricting the practice of assaying to qualified men, many of the fabulously rich assay returns reported from Larder Lake ores would never have seen the light of day. Some restrictions are absolutely necessary. Ontario cannot do better than to immediately follow the example of her Western sister.

PROSAIC MINERALS

While the mineral riches of New Ontario and the new promise of re-vitalized British Columbia have latterly attracted seekers after wealth, certain prosaic branches of the mineral industry are being carried on with quiet though increasing success. In the last number of the Canadian Mining Journal an outline was given of the extent and importance of asbestos mining in Quebec. The present issue contains an article written by the person who has contributed not a little to developing in Canada a successful graphite industry. In a future issue the mining and working of another economic mineral, mica, will be taken up.

In attacking and removing the difficulties that lay in their paths, the pioneers of these lesser industries had none of the glittering incentives that are held out to the seeker after precious metals. Slowly, surely, but with many discouragements, they have exploited their deposits, solved one by one the problems of mining and treatment, and have obtained a market. In every best sense of the term their work has exemplified the *true business* of mining. The iteration of that phrase, "business of mining," is intentional.

Figures of output are important, but more important is this, that Canada possesses several thriving industries and that these owe their existence to the sane, well-directed, practical intelligence of men who have faith in themselves and in their own country.

The Federal Government has devised new legislation which will undoubtedly be acceptable to Western coal consumers. It is provided that in Manitoba, Saskatchewan, Alberta, and Yukon Territory coal mining rights may be leased for twenty-one years at an annual rental of one dollar per annum, payable in advance. No applicant shall be allowed to lease an area larger than 2,560 acres. The area taken up by one applicant must not exceed four miles in its greatest dimension, and all holdings by one person must be contiguous. Applications are made through the Dominion Lands agent or through a sub-agent of the district. Thirty days are allowed an applicant for registering a location in unsurveyed territory. The lease includes only coal mining rights. The Minister may, however, permit the purchase

of the surface rights of whatever land in the location he deems necessary for the efficient working of the coal mining rights, at the rate of $10 per acre.

The phenomenal drop in Foster (Cobalt) stock, for which no cause is publicly assigned, should be taken as a note of warning. The Foster Mine is, so far as we know, a well-managed mine. It has been and will be a producer. To give anything approaching an adequate return on its heavy capitalization, it must be developed conservatively, and with an eye to the future. An attempt to secure an immediate heavy output might not only diminish the possibilities of the mine, but might fatally handicap it. If this then is true of the Foster, if the stock of a developed mine, with a generally acknowledged claim to fair prospects, is so sensitive to apparently unfounded rumors, what may we expect of the dozens of Larder Lake and Cobalt flotations that have no reason for eixstence beyond a title from the Government, a man-hole in the ground, and a broker's fervent desire to get into the public's pocket!

Here we may pause to observe that several Toronto mining brokers and promoters are advertising lavishly in the press of the Western and Maritime Provinces. We wish to warn those who are desirous of risking their money in mining ventures to refrain absolutely from purchasing stock in Larder Lake or Cobalt concerns, until they have consulted either the Ontario Bureau of Mines or some competent and reputable mining engineer. This is a re-iteration of what has been said before. But so glaring, so patently unsound are the statements made in the "display" advertisements, that they provoke renewed attention. A contemporary mining periodical cites an instance which may well be taken to heart. The L. M. Sullivan Company, of Nevada, a lavish advertiser, received as much as $140,000 in a single day from the sale of mining stocks which it was promoting, yet so tremendous were its expenses that the company failed and had to be reorganized. Advertising was the largest item in its expenditure.

Larder Lake has not yet a mine, much less a producing mine. What conceivable right can any firm of brokers, or any group of promoters, have to spend hundreds of dollars daily in advertising totally undeveloped possibilities? What law sanctions this misappropriation of monies received for an entirely different purpose? But why invoke the law! It is surely not vain to appeal to the common business sense of the long-suffering public!

AMERICAN MINING INSTITUTE

It is announced that arrangements have been consummated for holding a summer meeting of the American Mining Institute in Toronto. The date set is in July. More specific information will be forthcoming later. After a brief session in Toronto the members of the Institute will visit Cobalt, Copper Cliff and various other mining centres. The visit has been arranged largely by officials of the Ontario Bureau of Mines. The local Government is giving assistance, and it is expected that all mning men will heartily co-operate with the orginators of this movement. The American Mining Institute counts among its members nearly every prominent mining engineer in the United States. Its membership also includes many Canadians. As honorary members, it has enrolled the leading scientists of Europe. Toronto should heartily welcome this distinguished body of visitors.

EDITORIAL NOTES

Aluminium may, doubtless will, displace copper to a limited extent for certain incidental purposes. But the supply of aluminium is still insignificant as compared with the output of copper. And even were the world's supply of aluminium increased until it equalled the amount of available copper, it would have very little effect upon the price of the latter metal. For electrical uses copper is incomparably superior to aluminium, and will always be in demand. However, there are a hundred uses to which aluminium could be profitably put were there a more bountiful supply.

CANADIAN GRAPHITE

By H. P. H. Brumell, M.E., Buckingham, Que.
(Toronto Meeting, 1907.)

Of the many useful minerals of common occurrence and wide distribution in Canada, probably less is known of graphite than any other, yet in a quiet and unostentatious way there is being developed an industry in this mineral that promises, in the near future, to be of no small importance to the Dominion. Already there are several companies busily at work with the expectation of producing considerable quantities during the present year. Unfortunately, with regard to the higher grade of graphite (the so-called flake or crystalline quality), the business becomes a milling rather than a mining one as the ore is usually a disseminated one, requiring expert knowledge and special machinery. In the latter respect careful experiment has been required, and the present apparent success has only been won by large expenditure of both time and money.

The industry, which dates back to about 1860, has not until very recently been successful in this country, although with leaner ores it has been profitably conducted in the United States for many years, notably by the Joseph Dixon Crucible Company, the pioneers, on this continent, in the production of graphite from low percentage ores. They began operations as early as 1827.

Character of Graphite.—This mineral, which is, according to locality, termed graphite, plumbago or black-

lead, is essentially a crystalline form of carbon, although its occurrence in that form is practically unknown. It has a specific gravity of from 2.09 to 2.29, according to the percentage of impurity almost invariably found with it; is steel-grey to black in color; feels greasy; lustre, in the crypto-crystalline form, metallic; laminæ thin, flexible and inelastic. The impurities referred to above are usually some form of iron or calcite, while in an ore mined at Calabogie, Ont., the foreign substance is almost invariably one or other, as yet undetermined, of the chlorite group. For commercial purposes and those of this paper the mineral may be divided into three groups, viz., anthracite, amorphous and crystalline, the last being again divided into "vein" and "disseminated" ores. Of the anthracite variety there is a comparatively large deposit near Lepreau Harbor, on the Bay of Fundy, N.B., while the amorphous is found at a number of points in Nova Scotia, New Brunswick and Ontario. The last and most important variety is found, in commercial quantities, to a very great extent in the Archæan rocks lying to the north of the Ottawa River, and to a smaller extent in these rocks in Eastern Ontario. Although widely distributed over large areas of both these Provinces, the most important deposits of economic value in Quebec are confined to the Counties of Labelle and Argenteuil, while in Ontario the Counties of Lanark and Renfrew show a considerable development.

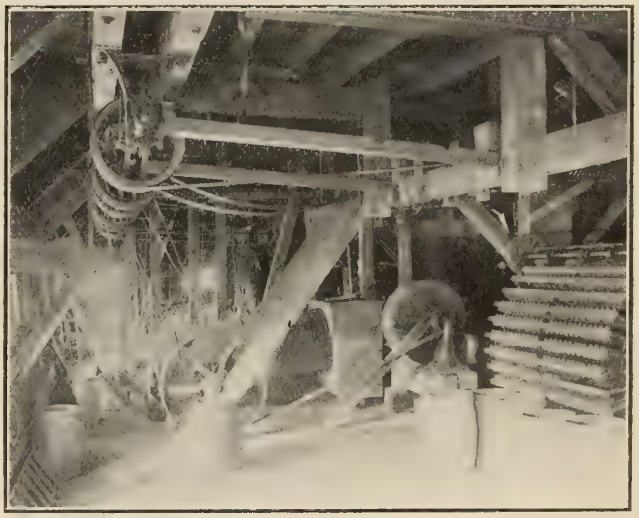
As to the relative value of disseminated and vein ores the writer has always held that the advantage has lain with the former variety by reason of its uniform character and continuity of deposit. Experience in the mining of both has proved this, and the writer is upheld in his opinion by the late H. G. Vennor, who, in the Report of the Geological Survey, 1873-4, writes: "Pure as is this vein-form of graphite, my experience shows that it is to the bedded deposits of this mineral that we must look for our chief supplies, and in this opinion I follow Sir William E. Logan, who, in the report already cited, says: 'The veins of this mineral hitherto found in the rocks of this country, although affording a very pure material, appear to be too limited and too irregular to be exclusively relied on for mining purposes, which should rather be directed to making available the large quantities of graphite which, as we have seen, are disseminated in certain beds.' Such beds are particularly well developed in the portion of Buckingham examined, as well as in the contiguous Township of Lochaber."

Distribution.—It has not been thought necessary for the purpose of this paper to go very deeply into the geographical distribution of this mineral, as very good descriptions of most of the known deposits may be found in the reports of the Geological Survey of Canada; nor is it necessary to go into its geological history for the same reason. Speaking generally, the only deposits of value are confined to rocks of pre-Cambrian age, the mineral being found usually in the Grenville series, or upper beds of the Laurentian system. Certain less important deposits of amorphous ore are occasionally met with in rocks of Devonian or lower Carboniferous age.

It may not be amiss to quote here a brief but very interesting description of the occurrence of graphite in Ceylon. This description constitutes part of the report of Mr. Joseph Hyde Pratt on Graphite in the "Mineral Resources of the United States" for 1904:—"The bulk of the world's supply of the crystalline graphite is obtained from the Island of Ceylon. These deposits are located in the western and southwestern portions of the island, the mineral area in which the graphite occurs being approximately 95 miles long in a north and south direction, with a width of 5 miles at its northern and of 43 miles at its southern end. The commercial graphite deposits occur in veins which traverse a garnetiferous granite rock. These veins vary in width from a few inches to 8 feet, and one has been followed to a depth of 720 feet; but from all accounts such a depth is exceptional. Horizontally the veins are very irregular and limited, and well-defined veins constantly pinch out. There does not seem to be any evidence of a main lode or series of lodes in any part of the district, but there appear to be two zones of the country rock, 4 miles and upward in width (the widest part being 20 miles), which seem to contain the veins that carry the graphite. These deposits have been described in some detail by Mr. George S. Stonier in a paper presented before the Insti-

BUCKINGHAM GRAPHITE COMPANY, BUCKINGHAM, QUE. General View of Works.

tute of Mining Engineers of London, entitled 'Graphite Mining in Ceylon and India.' He states that horizontal veins seem to be entirely disconnected, and that not only is there no indication of a main lode, but that there does seem to be even a series of connected lodes or veins. A vein four inches wide is considered as profitable mining. The largest mass of graphite which has been discovered in this district weighed nearly 6 tons. From the data at hand, Mr. Stonier considers that the fissures were formed first, and that the graphite, quartz, etc., were deposited in them. The graphite may have been introduced by

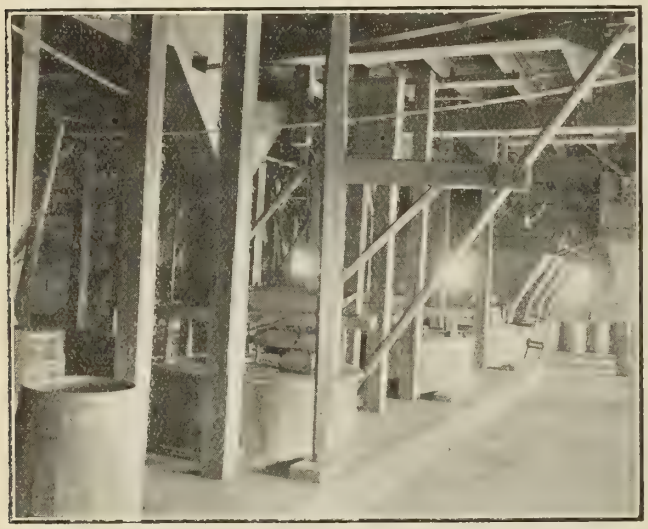


Buckingham Graphite Company's Mill, Buckingham, Que.

sublimation, not of carbons, but of hydrocarbons, as is suggested by the fact that a deposition of graphite-like material is often found in the cracks of upper layers of coke made in the closed ovens.

"There are about 300 mines and quarries in operation, which, with the exception of 3, are all worked by the old native methods. Attempts have been made to work the graphite deposits by modern methods, but on account of the uncertainty of the occurrence of the graphite, it has been found more profitable thus far to work the mines according to the old methods. This generally means that the graphite deposits are simply worked to water level. This is done by means of shallow shafts sunk 50 or 60 feet, the ore being hoisted in barrels and the mineral conveyed in boxes to the dressing sheds, where it is roughly picked and packed in barrels for transit to the shipping port, either Colombo or Galle. Here the graphite is resorted and screened, the larger pieces being broken up. In some cases the poorer portions are further concentrated by washing. It is then classified into five sizes, known as lump, ordinary, chips, dust, and flying dust, and these grades are further divided according to quality. It is estimated that Ceylon furnishes about 30 per cent. of the world's output of graphite and 75 per cent. of the value."

Origin.—Regarding the origin of graphite there has been no small amount of controversy, equally strong claims being set forth to prove an organic as those pointing to an inorganic origin. It is not considered necessary, nor within the province of this paper, to go into the subject deeply. Attention may, however, be drawn to two points, which, in the writer's opinion, would point to an inorganic genesis. First the occurrence of graphite in the silver veins on Silver Islet on Lake Superior. In his report on "Mines and Mining on Lake Superior" (Geological Survey Report, 1887-88) Mr. E. D. Ingall says:—"Graphite also occurs in considerable quantity and seems to be connected in some way with the occurrence of the silver. On enquiring of Mr. R. Trethewey as to what connection he had noticed between the existence of this graphite and the occurrence of the silver, with a view to ascertaining its value as an indication, he told me that although they never had silver without graphite, they sometimes had graphite without silver" . . . "In a specimen of the ore collected by myself are to be seen pieces of trap and graphite enclosed in pink spar, whilst in the graphite start out dendrites of silver." Secondly, and coming directly under the observation of the writer, and applying to practically all the deposits in Labelle County, is the fact that wherever the beds of disseminated ore are cut or in any way traversed, as they often are, by diorite, or other dikes, there is a very pronounced enrichment of graphite. At these points there is always an entire absence or marked lessening in quantity of calcic carbonate (calcite) and a very considerable quantity of calcic sulphate (selenite), while the pyrite is replaced by pseudomorphous ferric oxide. Without going into a lengthy argument on the above, might it not be concluded that under certain favorable conditions the calcite gave up part of its carbon, which was re-deposited as graphite, while the pyrites afforded the sulphur which, with the calcium, produced the selenite, leaving the iron to be resolved into ferric oxide. Again, all the known deposits of vein graphite occur in intrusive masses of diorite or pegmatite. Prof. A. Osann, of Mulhausen, Alsace, writes (Rep. Geo. Surv. 1899):—"The occurrence of graphite at Graphite City is connected with the appearance of massive eruptive rocks which in mineralogical composition are very similar to those described in connection with the apatite occurrence." . . . "As far as I could see on my short visit, the occurrence of the graphite is connected with the contact of this eruptive rock with gneiss and granular limestone. The limestone is in these places very much altered; there has been especially a large production of scapolite, pyroxene and titanite."



Part of Concentrating Plant, Buckingham Graphite Company, Buckingham, Que

In the limestones, as at Grenville and Calumet, the mineral occurs invariably as segregated masses rather than in veins. In writing the foregoing, reference is made only to the occurrence of the mineral in pre-Cambrian rocks; the amorphous graphite of Devonian and lower Carboniferous age being very probably due to the carbonization of organic remains.

History.—The history of graphite may be given in but few words. Knowledge of the existence of the mineral in Canada antedates the birth of our Geological Survey,

whose staff was, however, not long in taking cognizance of its existence. On 20th June, 1860, Mr. William E. Logan, later Sir William E. Logan, issued a circular letter from Toronto, asking for specimens for the Grand Industrial Exhibition to be held in London the following year, and we find in the catalogue of the Canadian exhibit, note of a specimen of plumbago from Lot 10, Range 5, Township of Grenville, Argenteuil County, Quebec, with the remark that there were two veins. Again in 1862, at the London International Exhibition, the Geological Survey exhibited specimens from Pointe du Chene, Grenville, and Lochaber, in Quebec. Shortly after, in 1867, work was begun in earnest and a small mill erected by the Canadian, afterwards the Montreal Plumbago Company, on a water power on Lot 28 in the Fifth Range of Buckingham Township, Labelle County, Que., the ore being obtained from Lot 28 in the Sixth Range, immediately to the north, and known as the "Castle" property. This mill was operated successfully until 1872, after which work was not carried on very actively, the only product being stove polish, made from material previously mined and at the mill. In 1873, the mill was destroyed by bush fires and all operations ceased.

Part of Finishing Plant, Buckingham Graphite Company, Buckingham, Que.

Work at about the same time was being prosecuted on a pure lump vein by Messrs. Pew & Weart on lots immediately to the east, and shortly afterwards a mill was erected in Lochaber Township on the Blanche River by the Lochaber Plumbago Mining Company, the ore to supply which being obtained from lots to the north, in the neighborhood of Long Lake. This mill proved unsuccessful, and, after treating some 600 to 700 tons, was abandoned. In reference to this mill, and in general to graphite mining in the County of Labelle at that time, Mr. H. G. Vennor writes (Rep. Geo. Surv. 1876-77) :— "From information gathered from several of the old settlers in this Township, I learned that the mining operations had been conducted here in a most unsystematic manner, and this fact was borne out by the shape and position of many of the openings which had been made. Mr. Pearce, who acted as general mining captain for this company, spent much of his time in devising plans for the mechanical separation of the plumbago from foreign matter, but with the exception of making some amusing mechanical toys, and adding greatly to the working expenses of the company, accomplished but little. While Mr. Pearce thus experimented, each miner was his own mining captain, and, as might have been expected, the greatest confusion prevailed until the company suspended work. I mention these facts here to explain the true cause of the total failure of this mining enterprise in Lochaber, for the suspension of work at one after another of the plumbago mines in both Buckingham and Lochaber has greatly discouraged those who are interested in their development. In conclusion, I would remark that plumbago yet abounds in both Buckingham and Lochaber, and all that is requisite for its successful mining is a cheap and effectual method of separating it from the impurities which are mechanically mingled with it." During 1875-76 the Dominion of Canada Plumbago Mining Company erected an extensive mill on Lot 19 in the 8th Range of Buckingham, which was in operation for some years. Lack of proper management and an over lavish expenditure of money, however, forced the company into bankruptcy in 1879, when the extensive property was bought in and the business rehabilitated under the name of the Walker Mining Company, which continued somewhat intermittently to operate the property until 1895, when all work ceased. The property lay fallow until 1905, when it was taken up and has since been operated by the Buckingham Graphite Company. In 1890 a mill was erected on the Pew & Weart property, north of Donaldson Lake, on Lot 26, Range 6, of Buckingham. It was re-built in 1892, and continued to produce in a spasmodic manner until about 1900. In 1872 a mill was built and operated at Oliver's Ferry, Ontario, with, it is said, considerable success, the ore being obtained from Lot 21, Range 6, Township of North Elmsley; details as to subsequent years are not available. This is, as far as is known, the only mill erected in Ontario in the early stages of the industry.

To come down to more recent years, the mill of the North American Graphite Company was built on Lot 28, Range 6, Township of Buckingham, in 1895, and in 1904 the mill of the late Walker Mining Company was entirely remodelled by the Buckingham Graphite Company. In Ontario, the mill of the Ontario Graphite Company was erected in 1902, and continued in operation for about a year, when a cave-in of the roof under Whitefish Lake flooded the mine, and all work was abandoned. In the same year the Globe Refining Company erected a small mill at Port Elmsley, which is in operation, though not financially successful, it is said, at the present time. Two mills are at present being erected, one near Calumet Station on the Canadian Pacific Railway, and another on the Lievre River, about six miles north of Buckingham, while extensive development work is being carried on at the Belle Mine, about three miles east of Buckingham. Rumor says that a mill will be erected on this property during the coming spring.

Crude ore has been, in the past few years, shipped from several points in Canada, the most important producers being the Ontario Graphite Company, who exported large quantities of amorphous ores, from their mine in Brougham Township, Ontario, previous to the flooding of their pit. Large quantities of a poorer quality of amorphous ore were shipped from Allanhurst, in Ontario, and from St. John and Petitcodiac in New Brunswick, while a considerable shipment of flake or crystalline ore was made from Grenville, Quebec, by the Keystone Graphite Company in 1900.

Methods.—Like many other industries not wholly proven, there is, in the treatment of the ore, a considerable amount of secrecy observed, which makes it very difficult to write with confidence of the various methods

employed. Speaking generally of the earlier efforts at milling, it may be said that in all instances the operators used the old system of stamping: in point of fact, with the exception of the Pew & Weart mill, all mills were so equipped until 1902, when the first dry mill was erected by the Globe Refining Company at Port Elmsley, Ontario. This company was followed, in 1903, by the Anglo-Canadian Graphite Syndicate of Birmingham, England, who took over the mill erected by the North American Graphite Company and rebuilt it on a dry principle, different, however, to that of the Globe Company. In the earlier mills, after crushing and stamping, concentration was had by stationary buddles, and, in some of the earliest plants, by keeves. The concentrates, after drying, were put through a system of buhrstones and revolving screens, until they were more or less finished, the resultant products being then graded for the various markets for which they were intended. At the mill of the Globe Refining Company, while the writer has not personal knowledge, concentration is had, after crushing and rolling the ore, by means of the Krom Separator or pneumatic jig, after which the concentrates are bolted and only two grades made, all material finer than 60 mesh being discarded. The plant erected by the Ontario Graphite Company in Brougham Township, Ontario, is equipped with the old, and now obsolete, system of stamps and buddles; a treatment to which the ore does not readily lend itself. This ore is unique, inasmuch as that it is practically amorphous, carrying about 10 per cent. of crypto-crystalline or flake graphite, and as both varieties are similar in gravity, but a very poor separation is made. As the crushed and buddled ore had to be dried after the so-called concentration and all the material in the buddles moved by hand, it will be seen that considerable extra expense was saddled on the finished product. The mill of the late Anglo-Canadian Graphite Syndicate, formerly the North American Graphite Company, was originally equipped with stamps and buddles but was, under the regime of the former company, remodelled and now contains Blake and roll-jaw crushers, between which the ore is dried by means of a cylindrical revolving fuel dryer. After coming from the roll-jaw crusher the ore passes through two sets of ordinary belted rolls, passing thence to a series of sizing screens, fitting it for the dry pneumatic concentrators. The tailings from these machines are then treated on the Brumell concentrator, a wet separator which relies on the floating quality of graphite, when dry, upon the moving surface of a body of water. The resultant concentrates from this wet separator are then dried by means of a revolving steam drier when all concentrates are taken to the buhrstones, by means of which, with the necessary accompanying screens and graders, the material is finished and ready for market. The mill of the Buckingham Graphite Company is equipped similarly to the foregoing, though its capacity is very much greater. In this mill the roll-jaw is replaced by a Gates rotary crusher and, in addition, a dry separator, known as the barrel concentrator, is used. In regard to the mills being erected at Calumet and Buckingham, great secrecy has been observed, and it is only from hearsay that the writer is led to say that the methods to be employed will be practically the same as are now used at Port Elmsley, Ont.

Market.—Much has been said, in the markets of the world, with a view to creating a prejudice against Canadian flake graphite, and as the trade has always looked to Ceylon, and old established connections still hold with that country, it has been found no easy matter to introduce the Canadian product. However, as we are now putting on the market material of such high percentage and have always maintained an uniformity of product, we are gradually breaking down the barrier of prejudice and annually gaining ground in the open market. As illustrative of the purity of our finished material, the following assays, made from stock, may prove of interest:—

I.—By Milton L. Hersey, Montreal, from Anglo-Canadian Syndicate Mill.

II.—B. A. E. Tucker, Birmingham, Eng., Anglo-Canadian Syndicate Mill.

III.—By Milton L. Hersey, Montreal, from Buckingham Graphite Company Mill.

	I.	II.	III.
GR	93.96	94.68	96.10

The foregoing stocks are of higher percentage than any other similar ones now on the market.

In his report on Canadian Graphite, Mr. G. C. Hoffmann (Rep. Geo. Surv. 1876-77) goes very thoroughly into the relative value of Canadian graphite compared with that of Ceylon, which is, and has always been, taken as par. In summing up his work, Mr. Hoffmann says: "From these experiments it will be seen that in respect to incombustibility the Canadian graphite may claim perfect equality with that of Ceylon; and that consequently—apart from any consideration of the proportion and nature of the associated foreign matter—it is in no wise inferior to the latter as a material for the manufacture of crucibles." In this report it will be seen that high percentage graphite was being produced, though not with financial success, as early as 1876, during which year the Dominion of Canada Plumbago Mining Company produced and marketed a small quantity of the following grades:—

A0.—For electrotyping, 82.31 per cent.
A1—For lubricating, 94.85 per cent.
A2—For lubricating, 89.26 per cent.
A3.—For crucibles, 92.35 per cent.
A4.—For crucibles, 94.30 per cent.
A5.—For crucibles, 95.59 per cent.
A6.—For crucibles, 96.36 per cent.

The following tables, from the same report, will illustrate the relative graphite values of vein graphite from Canada, Ceylon and Ticonderoga, N.Y. (the mines of the Joseph Dixon Crucible Company):—

Buckingham, vein graphite, variety foliated, sp. gr. 2.2689 carbon 99.675.

Buckingham, vein graphite, variety columnar, sp. gr. 2.2679 carbon 97.626.

Grenville, vein graphite, variety foliated, sp. gr. 2.2714 carbon 99.815.

Grenville, vein graphite, variety columnar, sp. gr. 2.2659 carbon 99.757.

Ceylon, vein graphite, variety foliated, sp. gr. 2.2664 carbon 99.679.

Ceylon, vein graphite, variety columnar, sp. gr. 2.2671 carbon 99.792.

Ceylon, vein graphite, variety foliated, sp. gr. 2.2484 carbon 99.284.

Ceylon, vein graphite, variety columnar, sp. gr. 2.2546 carbon 98.817.

Ticonderoga, vein graphite, variety foliated, sp. gr. 2,2599 carbon 96.656.

Ticonderoga, vein graphite, variety foliated, sp. gr. 2.2647 carbon 97.422.

After careful experiment, Mr. Hoffmann prepared and incorporated the following table as illustrative of the relative combustibility of Canadian graphite when compared with that of Ceylon, the latter being taken as par:—

Ceylon, vein graphite, variety foliated, 1.00.
Ceylon, vein graphite, variety foliated, 0.99.
Ceylon, vein graphite, variety columnar, 1.01.
Ceylon, vein graphite, variety columnar, 1.25.
Buckingham, vein graphite, variety foliated, 1.00.
Buckingham, vein graphite, variety columnar, 1.01.
Grenville, vein graphite, variety foliated, 1.02.
Grenville, vein graphite, variety columnar, 1.12.
Buckingham, disseminated, 1.02.
Buckingham, disseminated, 1.01.

Demand.—Generally speaking, the graphite industry has, for some years shown a marked annual increase, due, largely, to the development of electricity and consequent increased use of copper and its alloys, while, notwithstanding the introduction of open hearth steel, the demand for steel crucibles appears to increase. The average price, as well as the production, has also very materially increased, as is evidenced by the fact that in 1895 the combined markets of the United States and Great Britain were 23,513 tons, valued at $1,199,722, or $51 per ton, while in 1902 (the latest figures available to the writer) the same was 34,474 tons, valued at $3,321,525, or $96.45 per ton, of all grades. The fact that high grade Ceylon "lump" sold in 1895 for from three to four cents per pound, and is now selling for from six and a half to nine cents, according to quality, shows either a shortage or an increased demand. If all the mills now built, or in course of construction, were operating to their full capacity and turning out goods of high quality, there would be no difficulty in disposing of their production, as there are in the United States alone crucible manufacturers enough to take all the high grade flake produced, while the stove polish, paint, foundry facings, lubricating and electrotyping trades would easily look after the balance. Again, there is a very large market in Europe, especially in London, Hamburg and Vienna. It may be of interest to know that the North American Graphite Company were, in 1895, very glad to get three and a half cents for flake, while the Buckingham Graphite Company are, to-day getting for the same quality from six and a half to nine cents per pound. During 1902 only about one-tenth of the consumption of graphite in the United States was of domestic origin.

Mr. Joseph Hyde Pratt, in the "Mineral Resources of the United States" for 1904, gives the consumption of crystalline graphite, in the arts and manufactures, approximately as follows: For crucibles, 55 per cent.; stove polish, 15 per cent.; foundry facings, 10 per cent.; paint, 5 per cent.; all others, 15 per cent. The last named division includes powder polishing, electrotyping, steam packing, pencils and various minor uses

Uses.—To go thoroughly into the subject of the various manufactures of graphite and the many uses to which it is put would require a paper much longer than this. In addition to those mentioned by Mr. Pratt, it enters largely into the manufacture of shoe polish, printer's ink, electric light carbons, electrodes, rheostats and other electrical appliances and supplies, and is used by shot, bolt and nut, piano, wire, hat, and many other manufacturers; the means of using it are, however, not all known to the writer. As a lubricant, graphite has attained in late years a position of considerable prominence, and its use as such is rapidly growing. In the original Webster's Dictionary we find a lubricant defined as "that which lubricates: specifically, a substance, as oil, grease, plumbago, etc."

DIAMOND GRAPHITE COMPANY'S MILL, BUCKINGHAM, QUE. View from South-East.

William Kent, M.E., in his "Mechanical Engineers' Pocket Book," says: "Graphite in a condition of powder is used as a solid lubricant, so-called, to distinguish it from a liquid lubricant, has been found to do well where the latter has failed." Rennie, in 1829, says: "Graphite lessened friction in all cases where it was used." General Morin, at a later date, concluded from experiments that it could be used with advantage under heavy pressures; and Professor Thurston found it well adapted for use under both light and heavy pressures when mixed with certain oils. It is especially valuable to prevent abrasion and cutting under heavy loads and at low velocities.

At a meeting of the American Society of Mechanical Engineers, held in New York, in December, 1895, Pro-

fessor Albert Kingsbury, of Durham, N.H., read a paper on "Experiments on the Friction of Screws," wherein he describes certain tests made by himself. The author did not consider that the tests showed that any one of the metals developed less friction than any of the others, but the tests are specially interesting because of the great lessening of friction by means of graphite, as is shown by the following:—

Lubricant.	Mean.
Lard oil, heavy machinery	11
Oil (mineral), heavy machinery	14
Oil and graphite (equal volumes)	07

The following notes are taken from a pamphlet on lubrication, issued by the Joseph Dixon Crucible Company, and refer to part of a report on exhaustive tests made by Professor W. F. M. Goss, of Perdue University: "Graphite does not behave like oil, but associates itself with one or other of the rubbing surfaces. It enters every crack and pit in the surfaces and fills them, and if the surfaces are ill-shaped or irregularly worn, the graphite fills in and overlays until a new surface of more regular outline is produced. When applied to a well-fitted journal, the rubbing surfaces are coated with a layer so thin as to appear hardly more than a slight discoloration. If, on the other hand, the parts are poorly fitted, a veneering of graphite of varying thickness, which in the case of a certain experiment was found as great as 1-16 inch, will result. The character of this veneering is always the same, dense in structure, capable of resisting enormous pressure, continuous in service without apparent pore or crack, and presenting a superficial finish that is wonderfully smooth and delicate to the touch.

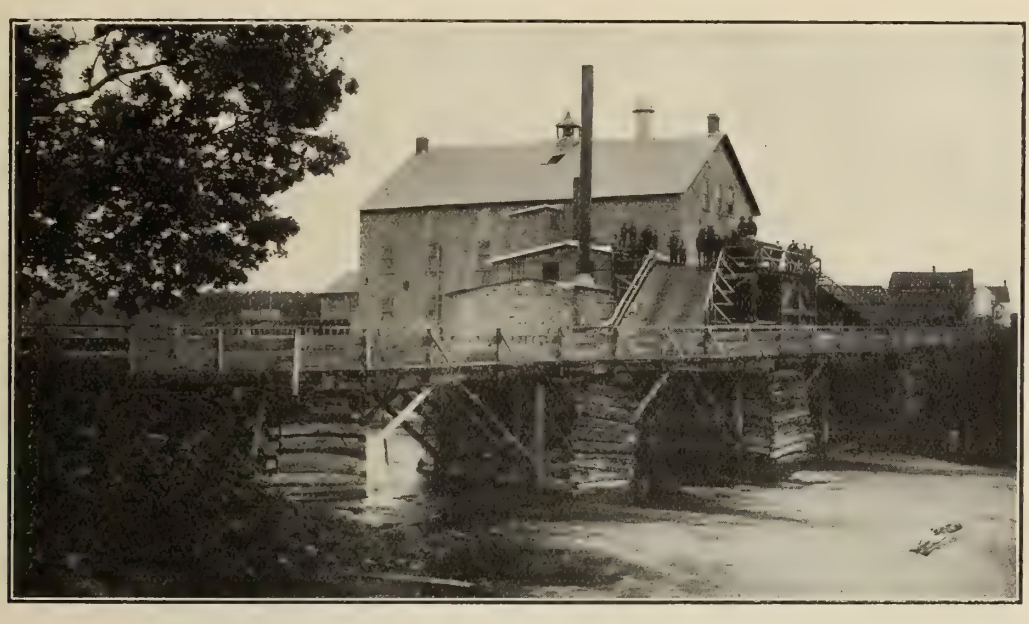
"The experiments with flake graphite as a lubricant justify the following important conclusions:—

"(a) The addition of graphite to oil results in a lower frictional resistance of the journal than would be obtained by the use of oil alone.

"(b) When graphite is used with oil, the amount of oil required for a given service is reduced.

"(c) By the use of graphite a light or an inferior quality of oil may be employed for a given service.

"(d) By the use of graphite, water under favorable conditions may serve as a sufficient lubricant.



"(e) A small amount of graphite only is required.

"(f) The supply of *too much* graphite unduly thickens the oil and correspondingly increases its internal friction due to viscosity.

"(g) The benefits derived from the use of graphite persist long after its application has ceased. The supply, however, should be constant, though small, for the best results."

In conclusion, it may be stated that, by reason of the high degree of purity attained in the mills of the late Anglo-Canadian Graphite Syndicate and the Buckingham Graphite Company, a considerable demand has arisen for their flake produced for lubrication, both in the United States and Great Britain, as well as in Germany, where graphite lubrication has probably reached its highest point.

Statistics.—It is extremely difficult to obtain correct statistics relative to graphite, more especially on this continent, where it is a notorious face that incorrect returns are almost invariably supplied to the various Government statistical offices, while from the various diverse figures obtainable from official centres of foreign countries it may be assumed that this notoriety is universal.

GLOBE REFINING COMPANY'S MILL, PORT ELMSLEY, ONT. View from South-East

In the following tables it has been the endeavor of the writer to obtain the most correct figures, though, of course, he does not vouch for them.

The annual production and imports and exports of Canada are given in the two following tables, and are taken from the reports of the Section of Mines of the Geological Survey.

ANNUAL PRODUCTION IN CANADA.

Year.	Tons.	Value.
1895	220	$6,150
1896	139	9,455
1897	436	16,240
1898	...	13,698
1899	1,130	24,179
1900	1,922	31,040
1901	2,210	38,780
1902	1,095	28,300
1903	728	23,745
1904	452	11,760
1905	541	17,032

IMPORTS AND EXPORTS OF CANADA.
1895-1905.

Year.	Imports.	Exports.
1895	$38,496	$4,833
1896	40,796	9,480
1897	38,943	4,325
1898	54,153	13,098
1899	62,803	22,490
1900	64,955	46,197
1901	77,893	35,102
1902	67,772	24,839
1903	72,546	43,642
1904	69,546	16,507
1905	.....	8,114

The production, imports and total consumption of the United States are contained in the following tables, taken from the "Mineral Resources of the United States" for 1904.

PRODUCTION AND CONSUMPTION OF THE UNITED STATES.
1895 to 1905.

	Production.		Imports.		Total.	
Year.	Tons.	Value.	Tons.	Value.	Tons.	Value.
1895	3,115	$52,582	8,814	$260,090	11,925	$312,672
1896	1,028	48,460	15,230	437,159	16,258	485,619
1897	1,751	65,730	8,533	270,952	10,284	336,682
1898	2,070	75,200	13,482	743,820	15,552	819,020

1904	19,767	321,372	12,674	905,581	32,441	1,226,953
1905	24,971	318,211	.....	.....	.....	.....

Deducting the cheap and low grade amorphous graphite produced in the United States, and combining the crystalline product only with the imports, we find a market there as follows (the last full figures available):

	Production.		Imports.		Total.		Value
Year.	Tons.	Value.	Tons.	Value.	Tons.	Value.	per ton.
1900..	2,754	$178,761	14,417	$1,390,141	17,171	$1,568,802	$91.35
1901..	1,984	135,914	14,325	895,010	16,309	1,080,924	63.20
1902..	2,088	153,147	18,201	1,168,554	20,289	1,321,701	65.15
1903..	2,269	154,170	16,007	1,207,700	18,276	1,361,870	74.50
1904..	2,840	238,447	12,674	905,581	15,514	1,144,028	73.75

Note.—In the above imports are included large quantities of Austrian crude ore worth only about $14.00 per ton.

The following table, illustrating the world's production, is taken, intact, from the "Mineral Resources of the United States" for 1904.

WORLD'S PRODUCTION OF GRAPHITE, 1895-1903.
(Quantity in Metric Tons.)

	1896.		1897.	
Country.	Tons.	Value.	Tons.	Value.
United States	933	$48,460	1,589	$65,730
Austria	35,972	410,081	38,504	439,610
Canada	126	9,455	396	16,240

Totals	56,739	977,405	70,546	1,787,185

NORTH AMERICAN GRAPHITE COMPANY'S MILL, BUCKINGHAM, QUE. View from West.

The exports of graphite from the United States would not materially change the above totals. According to official returns, they were in 1901, $365; in 1902, $834; in 1903, $13,365; and in 1904, $12,417.

In the "Mineral Resources of the United States" for 1903, Mr. Joseph Hyde Pratt says:—"The importance of the graphite industry in the United States is well emphasized by this table, and also the benefit that would be derived by this country if large deposits of commercial graphite could be found. There is a general increase in the quantity of graphite consumed, although there has been a very wide variation in the value of the production each year."

1903	24,492	1,952,529	79.70
1904	26,478	.....	.....

(a)—These values are taken from the official year books of the United Kingdom.

Artificial Graphite.—The introduction of artificial graphite into the market did not, as was feared at one time, revolutionize the industry, as the production of this substance by artificial means consists largely in the graphitizing of electrodes and similar electrical supplies, small quantities only being produced and sold for the manufacture of paints, dry batteries, commutator brushes, etc. The following notes regarding this product are taken from the "Mineral Resources of the United States" for 1903:—

"Methods for the production of artificial graphite have been known for a great many years, but it is only within the last eight years that a method has been devised for manufacturing it commercially. The three principal methods by which artificial graphite has been made are: (1) By heating amorphous carbon to a very high temperature in the electric furnace. (2) By dissolving an excess of carbon in a molten metal at a high temperature; on allowing the metal to cool down, the excess of carbon separates out as graphite. (3) By the disassociation of certain carbon compounds by means of metallic iron, or iron oxide, at high temperatures. The method now employed in the manufacture of artificial graphite was discovered by Mr. E. G. Acheson, who also discovered carborundum. Mr. Acheson defines his method of manufacture as follows:—'This method of manufacturing graphite I would define as consisting in heating carbon, in association with one or more oxides, to a temperature sufficiently high to cause a chemical reaction between the constituents, and then continuing the heating until the combined carbon separates in the free state. It is not, however, limited to the use of oxides, as pure metals, their sulphides and other salts may be used, but for various reasons the oxides are to be preferred.'" (Jour. Frank. Inst., June, 1899).

The following table of the production of artificial graphite is taken from the "Mineral Resources of the United States" for 1904:—

PRODUCTION AND VALUE OF ARTIFICIAL GRAPHITE, 1897 to 1904.

Year.	Pounds.	Value.	Unit Value per Pound, cents.
1897	162,382	$10,149	6.25
1898	185,647	11,603	6.25
1899	405,870	32,475	8.00
1900	860,750	68,860	8.00
1901	2,500,000	119,000	4.76
1902	2,358,828	110,700	4.70
1903	2,620,000	178,670	6.82
1904	3,248,000	217,790	6.71

OCCURRENCE OF GRAPHITE*

The United Kingdom.—At Borrowdale, near Keswick, in Cumberland, were the only graphite deposits of importance. These gave out before 1843, after being worked for nearly three centuries. The mineral occurs here in a compact, much altered plagioclase augite rock described as a diabase, and in the adjoining volcanic ash beds of the Borrowdale series. It occurs near the junction of these rocks with an intrusive dyke, which has the appearance of a diorite. The decomposed feldspar, which forms the greater part of this rock, contains specks of graphite consisting of minute hexagonal plates. Strings of quartz also occur containing nests of graphite. The mineral appears to have occurred very irregularly in veins, beds and pockets. Large masses were met with at the intersection of the veins. It is not clear whether these masses are identical with the pockets or pipes, which were oval in section, sometimes measuring three yards in length by one yard in breadth, and were mixed with strings or bunches of quartz. They attained considerable depth, but began and ended suddenly. Infillings of graphite occurred in the joints in the neighborhood.

Analyses of some of the Borrowdale graphite gave from 78.10 to 91.55 per cent. of carbon, 1.10 to 6.10 per cent. of volatile matter, and 7.35 to 15.80 per cent. of ash, chiefly silica, alumina and iron. One analysis gave as high as 3.15 per cent. of titanium oxide.

*Condensed from an article in a recent Bulletin of the Imperial Institute.

Other occurrences of graphitie in a spotted slate of the Borrowdale volcanic series and in a granite quarry near Penryn, may be mentioned.

In Scotland graphite is found in many places, none of which has been continuously worked. At Craigman, in Ayrshire, a seam 3 to 6 feet thick is composed partly of graphite, "compact, scaly or columnar," and partly of glance coal. The coal has apparently been metamorphosed to graphite by intrusive sheets of greenstone, which now lie both above and below the seam. In Invernessshire, scaly or curved and foliated graphite is found in irregular masses in a micaceous gneiss, intersected by small veins of red granite.

Germany.—The only important workings in Germany are at Passau, in Bavaria. The graphite occurs in lenticular masses of highly-decomposed micaceous rock found in the hercynian gneiss, near the line of contact with the granitic rocks. The deposits are accompanied on the foot-wall side by beds of syenite and crystalline limestone, both of which contain a certain amount of graphite, and on the hanging wall by intrusions of gabbro. It is believed that the great earth movements that at an early period affected the district operated most strongly at the junction of the unequally-resisting gneiss and limestone, and that the syenite found its way along this line of weakness. The subsequent granitic intrusions were followed by emanations which decomposed the gneiss where it was crushed, and at the same time deposited the graphite. The gabbro was subsequently intruded, and from it was derived the pyrite which often accompanies the graphite.

Almost everywhere the presence of the graphite is marked by extreme decomposition of the rock, the original minerals and the structure being almost entirely destroyed. The deposition of the graphite seems to have been an accompaniment of this process. Everywhere it seems to have followed the lines of least resistance, being found in regions of crushing and portions of the rock rich in mica. The graphite occurs in large flakes, and is easily concentrated to 90 per cent. carbon by dry processes.

Austria.—The principal deposits of Austria are in Bohemia, in gneisses, granulites and mica schists, on the other side of the great granitic tract which adjoins the graphite region of Bavaria. Here also the crystalline limestone is met with in the neighborhood of the graphite. In the Bohemian beds pyrite is widely disseminated, an dweathers to a yellow ferruginous crust on the surface. The refined material does not contain more than 50 or 60 per cent. of graphite. In Styria, also, graphite is obtained. It occurs as beds or impregnations in chloritoid schists, alternating with true phyllites. It is remarkably free from pyrite, which occurs only in aggregates visble to the naked eye, and therefore easily removable. It occurs as a soft, earthy, lustreless variety, as "hard graphite," resembling anthracite, and in vesicular or coke-like forms. The vesicles in the third variety are filled with earthy graphite of great purity. Deposits of graphite, supposed to have resulted from the metamorphism of vegetable matter, are found in Moravia, where seams of graphite and of gneiss impregnated with graphite are intercalated in crystalline limestone. Metamorphism is attributed to intrusive sheets of basic rocks now represented by amphibolites.

Italy.—Graphite is worked in the north-west of Italy, where are deposits very similar to those of Styria.

Asiatic Russia.—There are numerous deposits of graphite in Siberia, but little work is being carried on. At a mine at Batugal, near Irkutsk, a thick vein of pure graphite appears to have traversed a granitic or dioritic rock. Large lumps of pure graphite are said to have occurred in the adjoining metamorphosed limestone.

India.—Graphite is found in many places in India. The most important deposits are in Travancore State, where it occurs in granulitic rocks of the charnockite series. In certain localities in the Central Provinces graphite is found in a series of garnet sillimanite rocks which overlie the granitoid gneiss. Graphite is also met with in Afghanistan and the Punjab, and it occurs in crystalline schists in the Kumaun district of the North-west Provinces.

Ceylon—From Ceylon the finest graphite is obtained. The mineral sometimes occurs in small scattered flakes in the granulites allied to the charnockite series of Southern India, and in the crystalline limestone. The deposits of commercial importance are, however, from beds, veins or nests in the granulite rocks and are undoubtedly of secondary formation. Large pockets containing many tons of pure flaky graphite alternate with narrow veins branching in all directions through the rock. The crystalline rocks are often altered at the surface, forming a coating of laterite that may be 15 to 18 feet in thickness, in which graphite of poor quality is still visible. By following this graphite down, material of the best quality may be discovered in the solid rock. The graphite has usually a flaky columnar structure, but occasionally large tabular crystals occur with a diameter of as much as 8 inches. A tendency to a radial formation causes the mineral to break up into three-cornered fragments. Sometimes it becomes so stringy as to be nearly asbestiform, or it may assume a compact finely-scaly structure.

The coarse prismatic structure usually occurs with a direction at right angles to the walls of the vein, while in the centre there is a secondary formation of compact mica. Where there has been movement along the vein the fibrous or flaky structure is drawn out more or less parallel to the walls, and in this way is often rendered compact. There is little alteration of the adjoining rock by the action of hot water and gases. Sometimes the adjoining rock is penetrated by scales and flakes of graphite, but not to a greater depth than about half an inch.

New South Wales.—Graphite occurs frequently in New South Wales, though little work is carried on. In Buller County, coal of the permocarboniferous period is converted into graphite by the neighborhood of an intrusive mass of granite. At a point 26 miles north of Walcha graphite occurs in a eurite dyke which is generally micropegmatitic and crowded with spheroidal segregations of graphitic material. The dyke is intrusive n a granite.

Victoria.—Fairly pure graphite, in small amount, is found in ordovician slates and graphitic slates.

Queensland.—Near Maryborough, bituminous coal of carbonaceous age is stated to have been metamorphosed by intrusive igneous rocks, mainly hornblende andisite. It has been converted on the west into graphite, on the east to semi-bituminous coal, anthracite and graphite.

New Zealand.—Considerable deposits of graphite occur at Pahawan Bay.

Canada is dealt with in another article in this issue.

United States—The deposits at Ticonderoga, Essex County, N.Y., occurring in a fissure vein in a garnetiferous gneiss, the foliation of which it cuts nearly at right angles, are the most important in the United States. Graphite is also met with in a grey quartzite, interbedded

with garnetiferous and micaceous gneiss. The rock contains about 10 per cent. of graphite, half of which is saved. The graphite of Newport, Rhode Island, appears to consist of coal of carboniferous age, metamorphosed into graphite.

MEXICO—At Sonora compact graphite is found where a coalfield of carbonaceous age has been much broken up by trap dykes.

SOUTH AMERICA.—Graphite is found in Brazil, where it is said to be formed by the alteration of carbonaceous beds.

REGARDING LEAD PENCILS

H. P. H. BRUMELL, BUCKINGHAM, QUE.

"Sir, I have been bold to note places with my black-leade."—Letter of John Evelyn, about 1650 A.D.

Why are lead pencils so called? In early German metal mining operations considerable quantities of a substance affording a grey-black streak or mark similar to that of metallic lead (in German, blei) were encountered, and it was assumed to be a variety of ore of that metal. To distinguish it, however, the new mineral was afterwards termed "wasserblei" (Molybdæna). In the graphite trade of the present day the German product is always styled German lead; that of Ceylon is known as plumbago, while the United States product is called graphite.

The making of lead pencils originated at the time of the discovery of graphite at Borrowdale, in England, in 1554. The name lead pencil was evolved through the confusion caused by the German misnomer "wasserblei," the material used being given the name of "reissblei" (drawing lead). To make matters ever more confusing, the makers of lead pencils called themselves "bleiweisschneiders" (white lead cutters).

In the early stages of the industry very crude methods obtained. According to Robt. Jameson, "Manual of Mineralogy," Edinburgh, 1821, "The finer kinds—(of graphite)—are first boiled in oil, and then cut into tables or pencils; the coarser parts, and the refuse of the sawings, are melted with sulphur, and then cast into coarse pencils for carpenters; they are easily distinguished by their sulphureous smell."

John L. Comstock, in "An Introduction to Mineralogy," Hartford, 1834, says: "The finer kinds of graphite are sawn into thin plates, one edge of which is then inserted into a groove, in a small semi-cylinder of cedar wood, which is then sawn off in a line with the wood, and the other half glued on. In this manner the common black lead pencils are made."

As may be seen, the early method of manufacture was most wasteful. In 1795 Coute, a Frenchman, conceived the idea of pulverizing the graphite and mixing it with a binding clay. This mixture, when baked, was used in the old way and afforded a much more uniform product, and by reason of the clay admixture, he was enabled to produce pencils of varying degrees of hardness. With modifications, and the vast improvements brought about by modern machinery, this method is still employed in the making of graphite lead pencils.

Figures are not at hand relating to the extent of the pencil industry, but it is well known that enormous numbers are produced annually in Great Britain, the United States and Germany, smaller quantities being produced in France and Austria. In the United States, according to the Forest Service Bureau of that country, about 320,000,000 are produced annually. To this may be added about the same number for Great Britain and about five times as many for Germany and Austria. For the manufacture of those produced in the United States, 7,300,000 cubic feet, or 110,000 tons of wood are used, nearly all of which is red cedar.

Toward the conservation and economic use of commercial woods, the Forest Service Bureau has made a careful study of red cedar, and recommends several changes in present forest management in order to secure the desired growth. In the Southern forests the cedar will have to be given a better chance, instead of being considered, as now, a negligible quantity in its younger stages, and many of the forest-grown trees, which are now cut for fence posts, can profitably be left to attain their full development, and thus become available for pencil wood.

It is doubtful if any other wood-using industry is so dependent upon a single species as the pencil industry is dependent on red cedar. In fact, red cedar suitable for pencil manufacture is the only wood the price of which is always quoted by the pound.

No graphite pencils or crayons are, as yet, produced in Canada, the market of which is supplied principally by Great Britain, United States, and Germany. The imports for the past twelve years were as follows:

1895	$57,911	1901	$104,455
1896	62,598	1902	105,662
1897	71,211	1903	125,036
1898	73,002	1904	153,598
1899	80,474	1905	172,871
1900	98,832	1906	175,747

PROSPECTING IN UNGAVA

(Continued from page 48.)

For our dog-sledge (komitik) trip to the south we engaged two dog teams and komitiks besides our own. Although March was more than half over, the weather was still severe. We were equipped with a sheet-iron stove, a light canvas tent, deer-skin sleeping bags, and heavy deer-skin clothing. Ample quantities of provisions were taken along and cached on Gillies' Island.

Most of our travelling was done on the snow-covered ice between the islands and the mainland, although several times we were forced on account of loose ice, to travel inland over very broken country. It is then that the Eskimo displays his skill as a teamster. He leads his dogs with the nicest precision over bad ground, skirts the difficult hills, prevent his komitik from bumping over hummocks, and in all exercises wonderful judgment and resourcefulness. He further develops a marvellous degree of cleverness in handling the long Eskimo whip—a deadly weapon, consisting of a short handle of wood or of heavy hide, with a long lash, ten to fifteen feet in length, made of interwoven thongs of rawhide. With this whip the Eskimo can flick a tuft of hair and skin off any recalcitrant member of his team. In the hands of a novice, however, it is suicidal.

About eight days' travelling brought us to Gillies' Island. Three nights we had slept in snow houses. For fuel we had to depend upon driftwood, which we dug up on the island shores. When we found driftwood we cooked our meals on our camp stove and pitched our tent. When no wood was discoverable, we slept in snow houses and dined on biscuits, stick chocolate and deer's fat. Our day's run rarely exceeded twenty-five miles. In stormy weather (and the snow storms of Ungava are not pre-eminently pleasant) we were content when we had covered much less ground. After early breakfast,

the komitiks were hastily loaded, securely thonged, the dogs were harnessed up, and we walked and ran alongside the teams until noon. A breathing spell of a few minutes was then allowed. Sometimes, not very frequently, we brewed a hot pot of tea. Oftener we simply munched our cholocate and biscuits. Usually we allowed a good hour of daylight for pitching our tent or building snow houses. One of our Eskimos took occasional trips after seals for dog feed. The dogs were fed but once a day. During work hours they behaved themselves, indulging only in mild squabbling. All real differences or disputes were settled in the evening, and many were the wounded animals that we had to mend. The leader of each team pulled on a long centre trace. The rest of the team were arranged like the sticks of a fan on either side of the leader, with gradually shortening traces. When a dog misbehaved himself his trace was shortened and the whip was brought into requisition. For the leader it was usually sufficient to shorten his trace.

When we reached Gillies' Island, where our surveying was to be commenced, the ice began to show signs of softening. We managed, however, to complete our work there, although we moved our camp to the mainland opposite. In marking out our claims we used posts hewn from driftwood, clearing away the snow at the claim corners as well as could be, and securing the posts with loose pieces of shale. Before April 1st we finished the location of claims on Gillies' Island, and made a traverse of its shores. In all this work we used two of our Eskimos as chainmen, etc. They proved reliable and intelligent and exceptionally quick. By April 6th we had finished location work on Taylor Island, and had traversed to Nastapoka Falls. A winter view of these glorious falls is compensation for any amount of hardship.

We reached Port Harrison, our winter quarters, on April 11th. A very marked difference in weather was now observable. Although we had encountered a few days of soft weather near Gillies' Island and at Nastapoka Falls, at Port Harrison, winter was still supreme. However, the northern sun had done strange things with our complexions. Our first view of ourselves in a looking glass was a surprise. Our faces were tanned to a rich mahogany color, and our beards bleached to a straw shade.

Late in April the other two white members of our party, who had taken a trip up north, got back to headquarters. The laboratory was once again put into commission, and a series of gold and silver assays and various wet determinations were made. Plans and maps were prepared, and photographs developed. During May snow fell to such an extent as to exclude light altogether from the north side of our dwelling. On May 29th a snow storm of unusual severity completely blockaded us. Not until the first week of June did any approach to a thaw set in. On June 6th the last snow house (igloo), in which one of our Eskimo friends had been living, went out of commission.

The evenings were at this season so long that one could read ordinary print until 10 p.m. without artificial light. Towards the middle of June we began scraping, repairing and painting our yacht and sail-boats. The Innuksuak River (on the north bank of which were our winter quarters) did not clear itself of ice until June 28.

On Tuesday, July 8, three of us, with one Eskimo, sailed north, intending to spend a few days in cruising. With much difficulty we made our way through ice and fog for about twenty miles north of the Innuksuak River. One night, when we had both anchors out, a field of ice drifted down on us. Both anchors were lost, and we escaped with our lives by the sheerest luck. After drifting about in the fog for many hours, we ran into a snug little harbor, where we moored the yacht. The Eskimo and Mr. Young were then despatched in our small tender to get assistance. In three days' time they came back with grappling irons and other necessities. We succeeded in recovering both anchors and hurried back to Port Harrison on July 22nd.

It only remained for us now to destroy whatever dangerous chemicals were left, to dismantle the laboratory, and to pack up as many of our belongings as we could take in the yacht. We had seriously thought of cruising out to the mysterious Belcher Islands; but the ice absolutely forbade this.

Our final "good-bye" was said to our Eskimo friends at Port Harrison on July 26. Violent rain and sleet storms drove the ice into Hopewell Sound and we were held at Leonard Island (one of the most southerly of the Hopewell Islands) until August 9th. Not until a week later did we reach Nastapoka River. Thrice we were forced to beach the yacht to save her, and we had several hairbreadth escapes from being jammed to pieces. By August 23rd all survey work left over from the spring was finished, and we headed for our long run to Moose Factory. After one or two mishaps we made Little Whale River August 30th. Here we stopped three days for repairs.

With the first symptom of warm weather the mosquitoes had appeared in clouds. We dreaded the necessity of landing on a fair day on account of these pests.

September 12 saw us in the mouth of Big River, within sight of Fort George. After enjoying the warm hospitality of this Hudson Bay post, we started south again. We reached Charlton Island without mishap. The second of three beautiful Husky dogs, which we had picked up a few weeks before, died here. Another had been lost at Fort George. The third, a magnificent iron grey fellow, came safely through to Ottawa.

A successful run to Moose Factory, and all but the last stage of our journey was over. After dismantling the yacht we hired a large canvas canoe, and, with a crew of six Indians, we started up the river. It took fourteen days of hard paddling to bring us to Missinabie, on the C. P. R. Our voyage up was without incident. We arrived in Ottawa in the second week of October, 1902, after an absence of eighteen months.

. . . . . .

That the vast deposits of iron ore between latitudes 56° and 58° will some day become valuable is certain. How long a period may elapse before it becomes practicable to develop them by means of the enormous water-powers within a few miles of their best sections will depend upon the gradual perfecting of electrometallurgical processes. There will also be problems of navigation to be met. But the establishment of rail connections at a Hudson Bay harbor and of a Hudson Bay-Atlantic steamship route, will indirectly throw a great deal of light upon all the latent possibilities of the Ungava shore.

Bulletin No. 1 of the Geological Survey of New Zealand mentions an important occurrence of platinum in the Hokitika District. Two localities are cited. At the first of these, Hailey's Creek, the white platiniferous quartz occurs in lenticular veins intercalated with the country rock, which consists of a dark shaly phyllite. Assays yielded from 3 dwts. 8 grs. to 1 dwt. 2 grs. of platinum and of silver from 1 oz. 4 dwts. to 7 dwts. per ton.

Report of the Nova Scotia Department of Mines for the Year Ended 30th September, 1906

The facts adduced from this report prove that Nova Scotia has, in the main, made due progress in developing her mineral resources.

Gold production has fallen off. The actual decrease is 504 ounces. The figures given for iron ore are of doubtful value. If the amount of iron ore imported be correctly given, it leaves but 1,064 tons to the credit of local mines—an obvious error. The coal output for 1906 exceeds that for 1905 by 636,185 tons, and the amount of soke made in the latter year is greater by 140,304 tons than the total for 1905. Gypsum and limestone show a notable increase. Copper ore re-appears upon the list. The table given herewith furnishes the figures of output for the years 1905 and 1906.

		Year ended Sept. 30, 1905.	Year ended Sept. 30, 1906.
Gold	Oz.	15,550	15,046
Iron ore [1]	Tons	73,600	648,042
Manganese ore [2]	"	22	1½
Coal raised [2]	"	5,050,420	5,866,605
Coke made [3]	"	367,778	508,082
Gypsum [3]	"	197,292	247,840
Limestone	"	274,002	400,584
Barytes [3]	"	4,500	3,500
Moulding sand [2]	"	230	1,460
Copper ore [4]	"	...	190

The total revenue of the Mines Department attained the very respectable amount of $643,457.77. Of this the item of coal royalty contributed $575,065.89. A sum of $64,954.57 was paid out in bonuses on each ton of coal consumed in the manufacture of iron and steel in Nova Scotia.

COAL TRADE.

The returns of coal sold during the year 1906 show 5,194,590 tons, as compared with 4,475,284 tons in 1905. Shipments to other Provinces and to the United States have very materially increased. Quebec took 1,739,308 tons, an increase of 246,909 tons in 1905. The amount consumed in Nova Scotia also displays a large increase. The Province took 1,962,206 tons in 1906, as against 1,651,735 tons in 1905.

The following figures give the coal production to counties:

	Total Coal Raised.
Cumberland County	638,728 tons
Pictou County	670,436 "
Cape Breton County	4,318,944 "
Other Counties	238,937 "

It is interesting to note that the Intercolonial Railway purchased 420,269¾ tons of round coal, 12,261 tons run of mine, and 5,099¾ tons of slack. Fifteen companies contributed to this total. Eight of these companies filled contracts for amounts greater than 20,000 tons. The Cumberland Railway & Coal Co. supplied the largest tonnage of round coal to the railway, 85,792½ tons. The Dominion Coal Co. came next with 63,414¾ tons. The Intercolonial supplied 60,141 tons. These, with the Acadia Coal Company, the Maritime Coal & Railway Co., and the Inverness Railway & Coal Co., were the largest contractors with the railroad.

Among the operating companies the Dominion Coal is by far the largest producer, its output being 3,603,985 tons. The Nova Scotia Steel and Coal comes next, with 665,033 tons; Cumberland Railway and Coal ,484,816; Acadia Coal Co., 329,641; Intercolonial Coal Co., 303,426 tons; Inverness Railway and Coal Co., 207,842 tons; Canada Coal and Railway Co., 50,688 tons. None of the remaining collieries exceeds 50,000 tons. 12,123 persons are employed in the coal mining industry.

GOLD MINING.

The total gold production for 1906 is given variously as 15,046 ounces and 13,048 ounces. We believe the former to be the correct figure.

GUYSBORO COUNTY.—In Guysboro County six companies are reported as actively engaged in mining and milling. At Isaac's Harbor the *Boston Richardson Mining Company*, employing 126 men, in two 10-hour shifts extracted 4,819 ounces of gold ($91,561) during 1906, from 35,220 tons of quartz, an average of $2.60 per ton. Instead of timber coverings for the levels, a rib 20 to 30 feet high is left over the levels, chute holes being left at intervals of 50 feet. This system is copied from the Treadwell. The Bromo-cyanide plant has given an average extraction of about 70 per cent. on concenrates carrying from $15 to $20 per ton, at a very low cost. A higher percentage extraction, it is claimed, could have been obtained, but the cost per ton would have been prohibitive. An abstract of the monthly statement for August, 1906, is here reproduced. It will repay examination:

No. of tons crushed	3,839 tons
No. of tons concentrated produced	82.72 tons
Value of ore per ton (assay)	$2 94
Value of concentrates per ton	17 00
Total value recovered	2 55
Cost of operation of mine, per ton	1 08
Cost of operation of mill, per ton	0 19
Cost of operation of cyaniding plant, per ton	0 10
Cost of cyaniding concentrates per ton concentrate	4 39
General maintenance of plant per ton of ore	0 53
Total cost of operation per ton of ore	1 90
Average crushing per stamp per 24 hours	2.98 tons

We consider these figures noteworthy. Here is a plant, treating ore averaging $2.94 per ton, at a nominal net profit of $1.04 per ton. The percentage of concentrates is low, and they carry only light values. The figures reported imply careful management and strict attention to detail. We are glad to notice that 40 stamps are to be added to this mine's equipment. The *Beaver Hat Gold Mining Company*, Lower Seal Harbor, under the management of Mr. S. Clifford MacLean, has been occupied largely in development work. The Seal Harbor Mining Company, soon to be operated anew, ceased work in 1906. The whole plant is to be run by electricity. The *Wine Harbor Mining Company*, managed by Mr. J. Owen James, employs about 40 men. From the 300-foot level comes most of the ore shipped. *California Gold Mining Company*, Cochran Hill, until recently under the management of Mr. G. F. McNaughton, has workings to the depth of 225 feet. All timbering is done by the square sett system.

[1] Iron ore imported, 646,978 tons.
[2] Ton of 2,240 lbs.
[3] Net tons.
[4] Amount exported.

Halifax County.—*The Ecum Secum Gold Fields, Limited,* operates 10 stamps of a 20-stamp mill. The mine was unwatered in August, 1906. The *Harrigan Cove Gold Mining Company,* Mr. Munroe Archibald, manager, has done a total of 470 feet in drifting. It has leased the St. Anthony Gold Mining Company's areas to the north. The Dominion Mining Company (formerly the Boston Tangier Company) have deepened their shaft to 202 feet. The *Dixon Mine,* Cariboo, is being worked on a small scale. On the Baltimore & Nova Scotia Mining Company's property (Cariboo District) nothing has been done beyond keeping the water below the 700-foot level . At Moose River the G. & K. Comapny are open-cutting the slate belt on Area 77. The property of the old Touquay Gold Mining Company is to be reopened. The Oldham Stirling Gold Company, at Oldham, employs 30 men. During the year the inclined shaft was carried to the depth of 969 feet, 129 feet being sunk during 12 months. New levels are driven at shaft bottom. All work here is done by underhand stoping. This is one of the very few Nova Scotia mines where this method of winning ore continues in use. The lead to the deep holds its size and the dip is 40 degrees, as compared with 38 degrees at 800 feet from the surface. Crushing in the Taylor mill, on an adjacent property, yielded two ounces to the ton. Two trials in the company's new mill resulted in a loss of fully one ounce to the ton. No reason is assigned for this remarkably poor work.

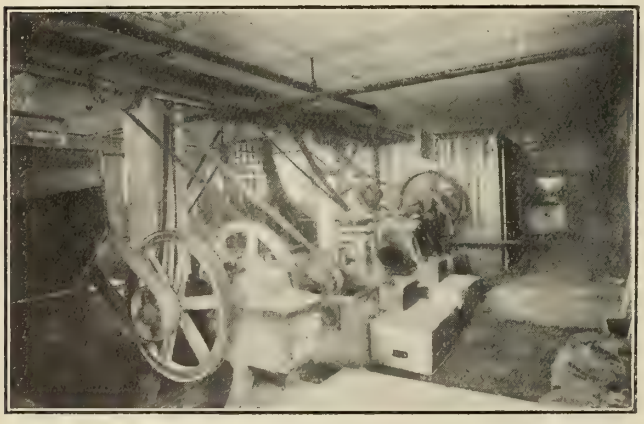
Lunenberg County.—The most important gold mining in this county was carried on by the Micmac Mining Company at Leipsigate. Sixty men are here employed in double shift. About 3,600 feet of levels have been driven during 1906. It is planned to operate the whole plant by electric power, brought from the town of Liverpool, 20 miles distant. As the mine is wet and fuel very expensive on account of the distance from tidewater and railway, this will be a very pronounced improvement.

AURIFEROUS ANTIMONY.

The Dominion Antimony Company, West Gore, Hants County, shipped a total of 782 tons of ore during 1906, yielding 1,031 ounces of gold ($19,589). Forty men were employed in two 10-hour shifts.

IRON ORE.

At Torbrook, Annapolis County, several mines operated by the Londonderry Iron & Milling Company produced about 27,000 tons of iron ore. The iron ore mined at Londonderry and Brookfield, Colchester County, is not mentioned in the report. The Londonderry output alone must have aggregated over 70,000 tons.



GOVERNMENT DRILLS.

The Provincial Government places three Diamond drills and four Calyx at the disposal of mine owners. During 1906 a total of 2,839 feet 9 inches were bored in carrying on prospecting. The cost per foot averaged from $2.66 for a 566-foot hole mostly in shale conglomerate and sandstone, with a Calyx steam drill, to 50c per foot for a 696-foot hole using a Diamond steam drill. The high cost of the first mentioned boring was due in part to delays in getting supplies.

The Mining Laboratory of Dalhousie University, Halifax, N.S.

By Frederick H. Sexton, S.B.

During the last four years, Dalhousie University, in Halifax, N.S., has established a faculty of engineering containing two departments, civil and mining engineering. The courses are now well organized and running smoothly, and a short history of the installation of the mining laboratory, setting forth some of the difficulties overcome, may be of interest to more than have actually been called upon to equip an up-to-date laboratory with an old-fashioned sum of money.

ORE CRUSHERS

STAMP MILL, SHOWING MOTOR DRIVE

The first step was to install apparatus for conducting work in fire assaying. It fortunately occurred that the Halifax Electric Tramway Co. were tearing down the by-product coke ovens of the plant formerly belonging to the People's Heat and Light Co. The Tramway Co. generously furnished the Mining Department all the second-hand fire brick it wished, for a price about half that of a good grade of common red brick. Enough good sound fire bricks were secured for pot, muffle and reverberatory furnaces. Fortunately, also, one of the mining students was an expert mason, used to handling fire brick, and he laid all the fire brick during spare hours.

The pot furnaces are made up of shells of ¼ in. boiler plate, with a door in the lower part of the front, and a draught hole in the upper part of the back. They are

lined with one course of fire brick laid stretcherwise inside. The grate is composed of loose bars of ¾ in. square wrought iron, supported by two 1 in. square wrought iron bars let into the brick work. The grate bars could be pulled out through the door. The furnaces are 15 in. square inside and 2 ft. 8 in. high. The cover is a 2 in. fire brick tile, bound with wrought iron and counterweighted so that it can be easily slid back to open the furnace. The total cost of each furnace to the college was $23.60, of which $21.15 was the cost of the shell obtained from local dealers.

The muffle furnaces are built in the same manner, i.e., a ¼ in. boiler plate shell lined with one thickness of fire brick laid stretcherwise. The furnace is 23 in. square inside, 4 ft. high, and contains an L Battersea muffle. There is a charging door for the coke above the muffle, a stoking door and an ash pit door at the very bottom. The fuel used is coke. The grate bars are the same as in the pot furnaces only of larger dimensions. The cost of a muffle furnace to the college was $48.20, of which the shell alone cost $44.50.

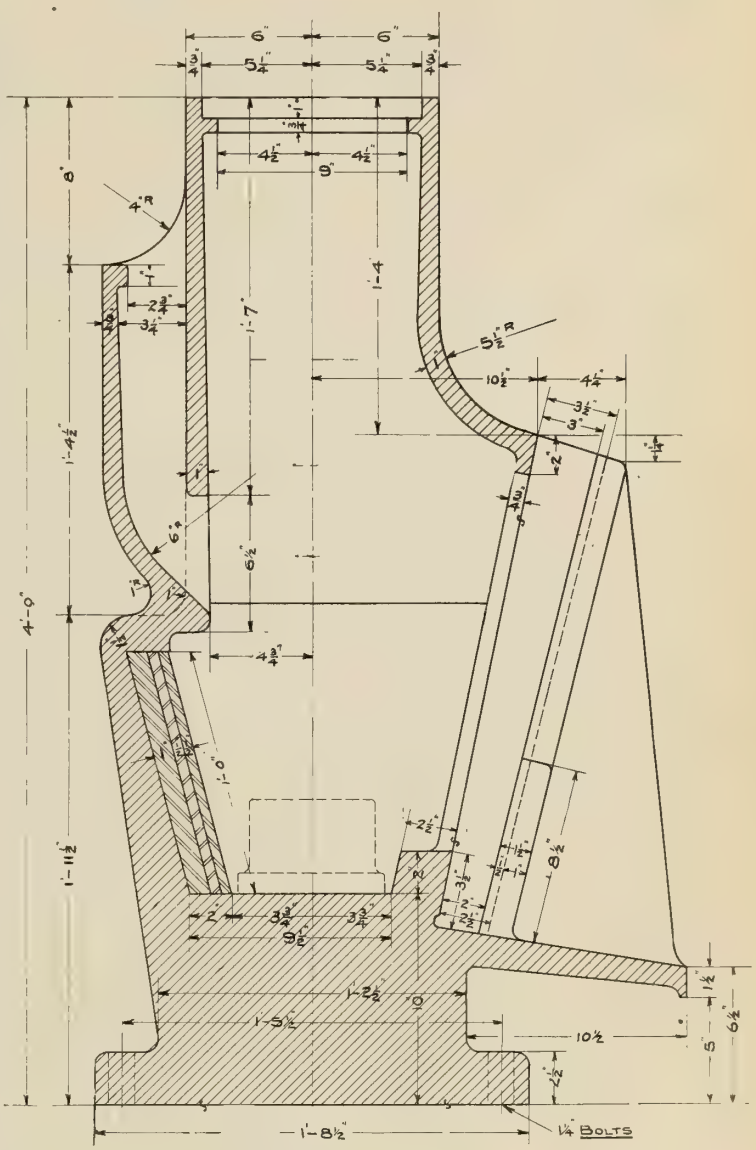
The pot and muffle furnaces have required nothing for repairs for three years except two sets of grate bars, two new baffle plates, and of course new muffles, and they have been in almost constant use during that time.

Later a gasoline muffle furnace was obtained from sums of money paid to the laboratory by people who come to work in it, and has proven most useful for muffle fusions and cupelling. With coke at $5 per ton and gasoline at 26c per gallon, it costs about two and a half times as much to run the gasoline muffle as the coke muffle, the latter being a trifle the smaller.

The working desks for assaying provide room for twelve students and were made for a reasonable sum by a local carpenter.

The next work attempted by the author and his students was the construction of a reverberatory roasting furnace. This has a hearth of 10 square feet area and a grate of 4½ square ft. area. The large ratio between the two areas is necessitated by its diminutive size. The hearth is composed of three large 4 in. tiles of fire clay, which give a very smooth surface with very few joints. There are three air entrances from the fire bridge directly to the hearth, through which fresh air is supplied to the roasting ore. An adjustable shutter regulates this air supply.

A small reverberatory furnace of the style of the English cupellation furnace, with removable test, is contemplated at present for the refining of copper and for cupellation of base bullion.



In the main mining laboratory is a single line of shafting running lengthwise, which is driven by a 10 h.p. 220 V., 3-phase induction motor, and which drives all the machinery except the stamp mill. All of the machines are set upon concrete foundations.

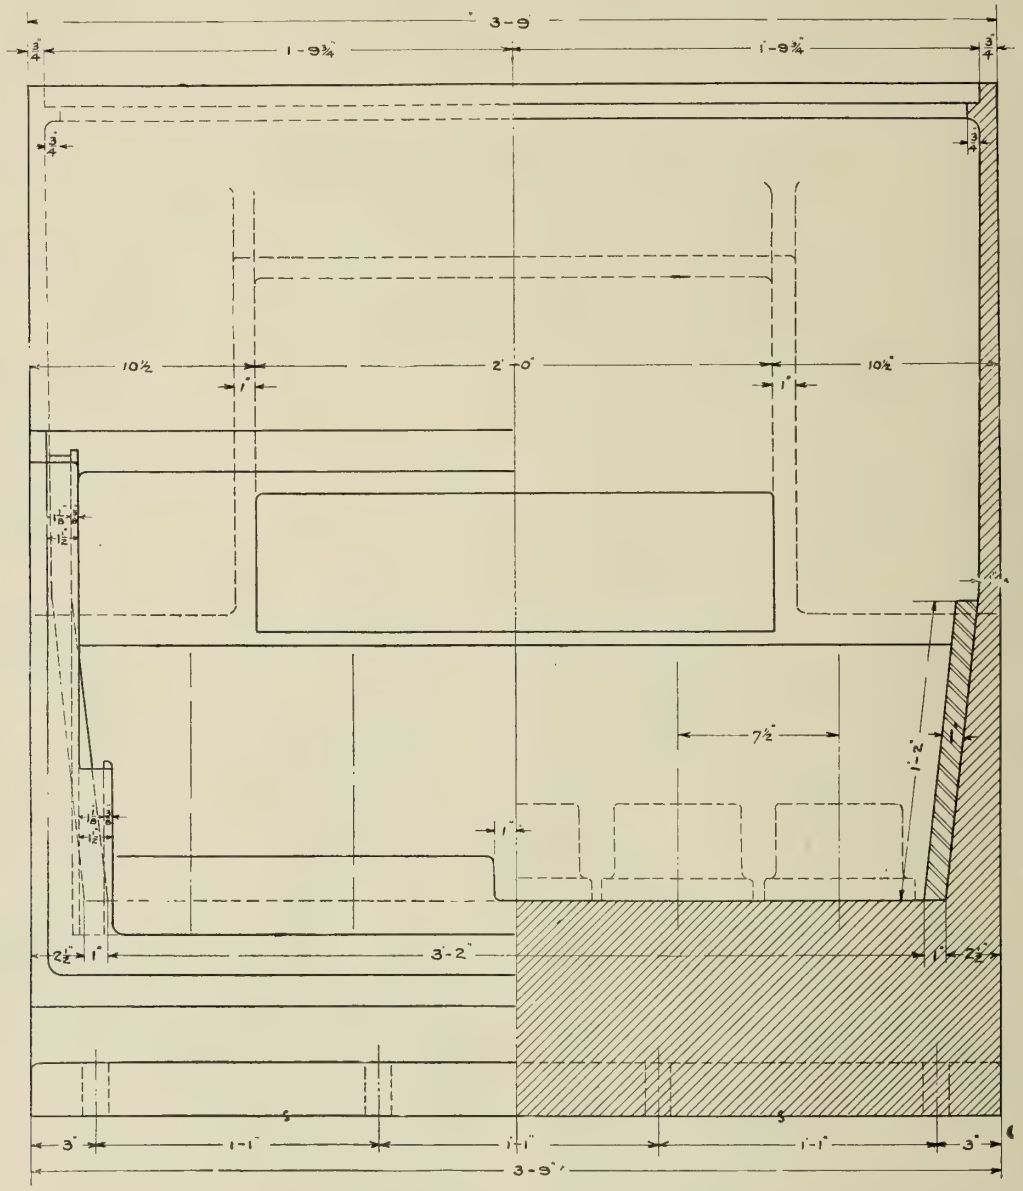
The crushing is done by three small laboratory crushers and a small pair of Cornish rolls. The coarse breaking is done by a 4 in. x 6 in. Blake-Marsden breaker, which will crush to 2 in., 1½ in., or 1 in., as desired. The intermediate crushing is performed by a small Gates spindle breaker built especially for laboratory work, which will take ore up to 2 in. diameter and reduce it to ¼ in. to ½ in. size. The finer work is done by a Gates fine grinder, which will grind ore of ¼ in. to ⅜ in. through a sieve of 80 meshes to the linear inch. These three machines are placed side by side, and with their aid a sample may be very quickly prepared for assay.

A sampling floor 10 ft. square, of concrete with a neat cement top finish, has been found to be very satisfactory.

The Cornish rolls were manufactured by the Jenckes Machine Co., of Sherbrooke, Quebec. The rolls are 8 in. face and 12 in. diameter, with manganese steel shells. They have not yet been provided with an automatic feeder, but will be in the near future. They are also set on a solid concrete foundation.

All screening is done in a flat shaking screen. This consists of a flat frame supported by light chains, shaken by an adjustable eccentric, which contains any one of a series of light frames 3 ft. 6 in. by 14 in., with different sizes of wire attached to them. This

CROSS SECTION OF MORTAR



screen is enclosed in a dust-proof casing. It is light enough to be moved from the rolls to the other crushers when needed.

The Mining Department was presented with a vertical duplex air compressor by the Canadian Rand Drill Co., with a capacity of 80 to 90 cubic feet of air per minute. This furnishes us with compressed air for all purposes.

The only machine for concentrating coarse sizes of ore at present is a two-plunger Collom jig presented to the laboratory by the Mining Department of the Massachusetts Institute of Technology. It is fitted with a very complete set of sieves, and serves its purpose very admirably.

A small gold clean-up barrel also constitutes a part of the equipment of the laboratory. This was secured from a gold mining company operating in the Province, for whom it had proved too small, at junk price. It serves many purposes. It fulfills its proper role as a clean-up barrel; it is also used as a tube mill, and serves as a machine in which to carry on slime agitation tests.

The laboratory also is possessed of some simple home-made classifiers. These are made by screwing into a cross-fitting of unequal dimensioned arms a short piece of pipe in the largest orifice for a sorting column. The two orifices at right angles to this piece of pipe would be such that their combined area was one and a half to twice as large as the cross-section of the first piece and by the proper piping the hydraulic water is fed into these two orifices, so that one-half of the hydraulic water meets the other half squarely, and rises with it in the sorting column. If the water is introduced at one side only in the sorting column, it gives rise to eddys and inversion currents that derange the work of the classifier. To the remaining orifice is screwed a reducing connection, into which is driven a wooden plug with the proper sized hole in it to serve as a spigot discharge. To the top of this lower sorting column of hydraulic galvanized pipe is soldered a rectangular box of proper cross-section to serve as an upper sorting column. This box has a slot near the bottom, into which the pulp is fed through a compartment soldered on the back as high as the box. The overflow escapes through a slot with an outward lip situated near the top of the box on the side opposite the feed. These classifiers are very easily and cheaply made, and have given good satisfaction for many kinds of work, from washing the sulphur from coal to classifying coarse, heavily sulphuretted ores.

MORTAR ELEVATION

For concentrating fine ores the Mining Department has a half-size Canadian Wilfley Table, manufactured expressly for the laboratory and presented by the Truro Foundry Company. The wash water can be regulated for every 18 in. in length of the table, thus supplying water on the table exactly as it is needed.

More effort was expended in designing and installing the stamp mill than in any other way. It was felt that the small three-stamp prospecting mill that is used in

so many mining laboratories did not duplicate well enough the actual operation of the common five-stamp mill. It was also felt that the actual full size mill required too much cost and labor in providing it with enough ore if run frequently, and that such a mill was not flexible enough in its adjustments to illustrate different milling practices.

Since the basement in which the mining machinery is installed is only nine feet high, it became necessary to excavate a hole large enough to sink it below the floor level. Therefore a rectangular hole 17 ft. wide and 32 ft. long was dug to a depth of nine feet and lined with a wall of concrete (1:9) 8 in. thick at the top and 18 in. thick at the bottom. The ground excavated was an extremely hard blue clay, so hard near the bottom that a pick could hardly be driven into it. The ground was also very wet, and a feeder was found near one corner of the pit that attained the proportions of 10 gallons per minute at one time, and had to be pumped night and day. To make the pit water-tight, plates of galvanized iron covered with tar were placed in the centre of the walls and bottom, the ends of the plates overlapping one another. There was such a constant inflow, however, that small channels were formed through the setting cement, so that the walls when finished were not absolutely water-tight. The amount of water seeping in now for a week is so small that it can be pumped up in five minutes.

The excavation of this pit and the settling tanks and the mixing of the concrete was performed by laborers, and this was the only work outside of the pipe fitting and part of the carpenter work of fitting the battery frame that was not performed by the author assisted by the students. All the machinery, battery, frame, mortar, etc., was moved into place even without the aid of block and tackle. A great deal of time and effort was required to get the battery frame in place, because there was only a clearance of two inches between the top of the post and the ceiling, and the timbers were heavy. The sills are 12 x 16 inches, the posts 12 x 14, and the back struts 12 x 12 inches unbled Georgia pine.

Following is a description of the installation of the stamp mill abstracted from a paper read by the author before the Mining Society of Nova Scotia on March 9, 1905:

"The stamp mill was designed with two chief ends in view. The first was to provide a wide range of adjustment in order to illustrate to the students the various practices of gold milling, and the other was to make the machine, as far as possible, suitable for testing any of the local ores for the best milling conditions for that particular ore. Thus the students could arrange the mill to have a high drop, high discharge, small number of drops and wide mortar, and carry out Colorado practice aiming at extracion principally by internal amalgamation. On the other hand, they could vary the same adjustments to turn the stamp mill into a machine running in the way of those in South Africa, where the principal aim is capacity and incidental amalgamation. In this way the flexibility and adaptability of the stamp mill is firmly impressed on the students' minds, and the adjustments become real live things that are bound to stay with him, instead of mere book statements that are so likely to fade quickly from his mind if he is not compelled to make practical use of them in after life. It was thought that this mill would be invaluable to an engineer in developing a new property, by giving him a chance to thoroughly test his ore and be sure of no mistake in designing his permanent mill.

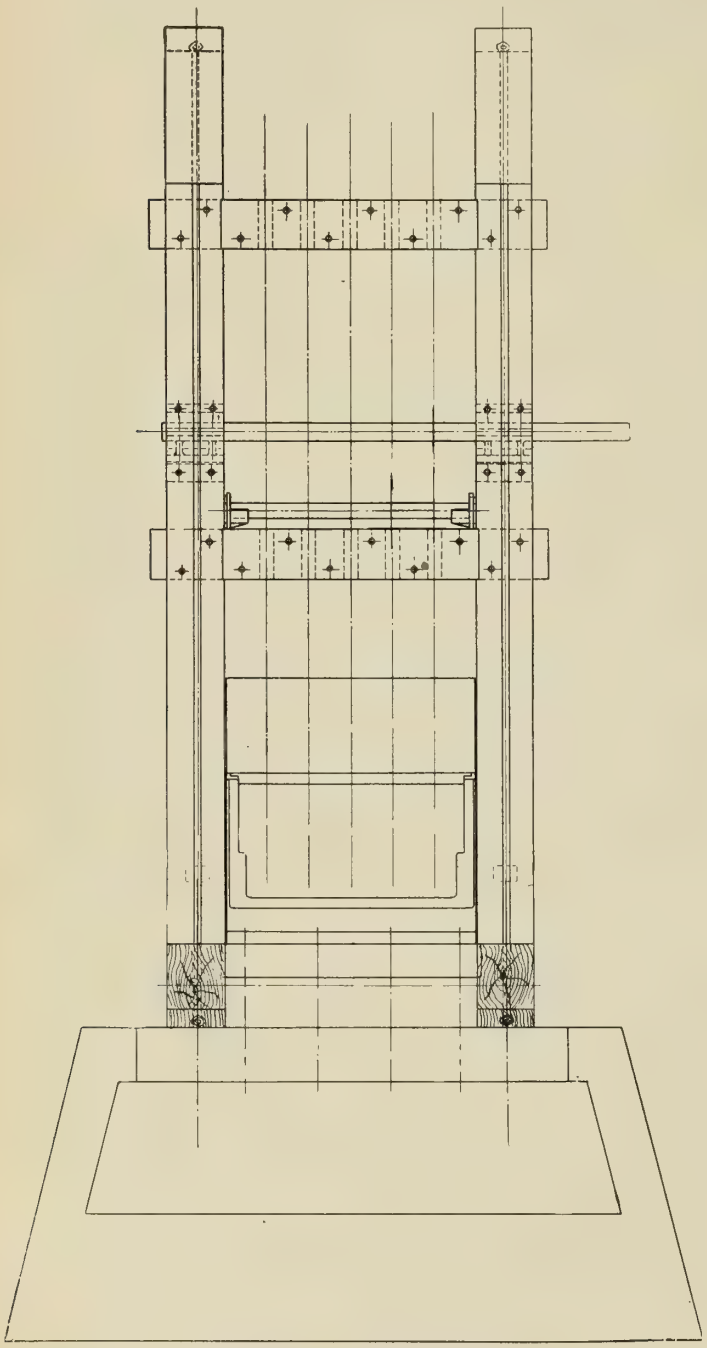
"The mortar block was built of concrete set on bed rock. The rock used was a hard, fine quartzite, locally known as 'whin.' This was purchased in the form of small boulders, and crushed in the laboratory 4 in. x 6 in. Marsden-Blake crusher to 2 in. The run of crusher was used because it contained very few fines. The quartzite broke in very sharp angular fragments, and was a most excellent product for concrete. At the bottom the proportions were:

Broken stone (2 in.—0)	5¼ parts.
Sharp sea sand	1¾ "
Portland cement	1 "

"The proportion of cement was increased toward the top. The top was composed of:

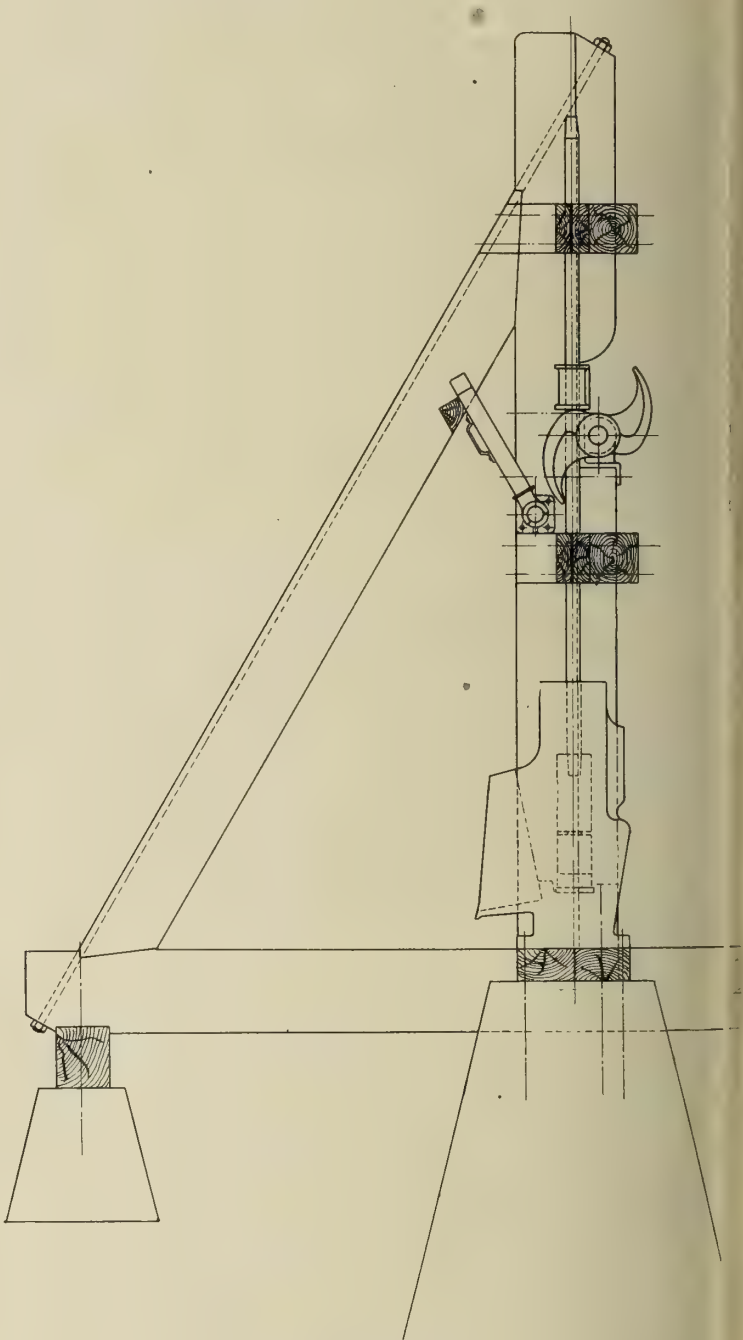
Broken stone (⅜ in.—⅛ in)	1 part.
Sharp sand	½ "
Portland cement	1 "

"Usually the top of the mortar block consists of a soft grout poured in after the mortar has been set in place on the anchor bolts. Where this has been done, in some cases that have come to my notice, the foot of the anvil block has cut into the grout, and the mortar has been thrown out of line. The use of part fine broken rock instead of pure sand in the top flushing gives a material that is better able to stand the abrasive jar of the anvil, to which it is subjected.



"On top of the concrete block was placed a piece of 5 in. unbled hard pine, thoroughly covered with tar. In regular modern installations it seems a general practice to place a piece of ¼ in. pure rubber between the concrete and the anvil block. The aim in this small mill was to dispense with the anvil block by casting a mortar with a very thick bottom, and to obtain the combined resiliency of rubber and anvil in the thin layer of hardwood. In this laboratory mill there was no call for great capacity, so that it did not need to be rigidly connected to the concrete. The anchor bolts were placed in pieces of 2 in. pipe which were filled in with 1:1 grout when the mortar was lined up and levelled. The nuts on the anchor bolts needed considerable tightening after the first run or two of the mill, but have not shown any sign of loosening since.

"The mortar which is shown in cross-section and elevation in the figures undoubtedly looks very grotesque to the experienced millman. It is exceedingly high and narrow and has an ill-favored looking hunch on the back which destroys the symmetry of the casting. The unusual height is to allow of a very high drop, and the hunch on the back is caused by a recess back of the dies filled with liner plates, which may be removed one by one to give greater width to the mortar when the rest of the adjustments are arranged to allow greater facility for internal battery amalgamation. As these back liner plates are removed, it leaves the dies relatively nearer the screen and in front of the axis of symmetry of the modified shape of the lower half of the mortar. This arrangement has proven most efficacious in reducing the swash of pulp in the mortar and offering a safe hiding place for the gold amalgam where it is little abraded. This same modification of placing the dies ahead of the centre line of the mortar was employed with great success by a local mine manager for the almost complete recovery by amalgamation of the values from a gold ore running about $200 to the ton, where the gold was so fine it could hardly be seen with the naked eye. When all the liner plates are in place, the mortar has a very narrow shape adapted for fast crushing.



"The mortar is provided with a low lip of 2 in. in the front within a slot of 2 in. cut in the centre of

it, through which a bar may be placed to lift the middle die first, in a clean up, and through which the last of the battery sands may be flushed out. It is common practice in Nova Scotia to use flush-bottom mortars without any front lip at all, but it would seem that these offer a good chance for the die to twist or overturn in running, although millmen claim this accident is of very rare occurrence. The bottom of the mortar is cast thick

"One inside amalgamated plate is attached to a curved chuck block just below the screen frame. There is provision for attaching a back amalgamated copper plate to the back of the mortar or to one of the back liner plates when using a wide mortar. The water is fed through the front under the screens in six jets through $\frac{1}{8}$ in. pipe, between each pair of dies and at each end. The ends of the pipes inside the mortar are set about $\frac{3}{4}$ in.

Front View Battery Frame Timbers of Stamp Mill.

Side Elevation of Stamp Mill.

to compensate for the lack of any anvil below it and for its comparatively rigid connection to the concrete mortar block. The front of the mortar is held in by four keys, a pair of long ones and a pair of short ones. With this arrangement, the front can be made in two sections and the upper half taken out to remove pieces of wood, iron, etc., or to replace a loose shoe; while the lower half, which retains the sand to the level of the top of the dies, is undisturbed.

below the level of the dies, and have an inclination up toward the top of the dies. These jets serve to keep the sand loose and offer a good hiding place for bits of hard amalgam. This is well shown in the clean up, for when the front is taken off a large bunch of bright, hard amalgam is seen in the place where each jet penetrated.

"The number of stamps is five, and their weight is 400 lbs. each. College laboratories very often use a

light three-stamp mill, such as is sometimes used in prospecting or first testing a property. The three-stamp mill is very faulty in principle. There is but one order of drop possible, i.e., 1, 2, 3. If you reverse it you simply call No. 1 stamp No. 3 and get the order 3, 2, 1. In either case there is a tendency to throw the pulp toward one end of the mortar in a bank, leaving the other end die comparatively bare. The three-stamp mill cannot adequately duplicate the ordinary five-stamp mill used in practice, and it should not be adopted for purposes of instructing students. In some laboratories full

WILFLEY TABLE AND CLEAN-UP BARREL

size five-stamp mills have been installed, but this is entirely unnecessary and leads to a great deal of trouble in getting sufficient ore to supply it. Besides this, it furnishes large quantities of products which are awkward to handle in the frequent clean-ups. The small mill for laboratory purposes should as nearly as possible duplicate the machine used in practice, and should strike a fair balance somewhere between a toy and a full-sized mill. The stems are of mild steel turned to size throughout. The cams are of the Canda self-locking type, and are set for the order of drop 1, 4, 2, 5, 3. The arms of the cams are very long and allow of a change of drop from 4 in. to 10 in. The cams are called upon to do their hardest work on the short fast drop, when only a part of the cam toward the point comes in contact with the tappet. In order to stand this usage, the arms and hubs of the cams were made much heavier in proportion to the weight of the stamp than is done in actual practice.

"The mill is fed with a Hendy-Challenge feeder. The actuating arm of the feeder, which is furnished with a long upward curve terminating in a fork, was cut, a piece taken out of it, and welded again to form a short horizontal arm which gives a much more sensitive feed.

"The frame of the mill is a back A frame. It is made throughout of unbled Georgia pine. This type leaves the outside amalgamated plated perfectly free and unobstructed. Each battery post is bolted by a long perpendicular anchor-bolt through the sills to the concrete mortar block. The sills are bolted just in front and back of the mortar block by heavy horizontal tie rods. This gives a construction which is extremely rigid. The inserted plate shows the arrangement of the battery frame as it was first planned. The present arrangement is better because the mortar was turned around to face the other way, leaving the plate entirely unobstructed. The feeder was placed on a platform between the two back struts. The sills were cut off 18 in. in front of the battery post and, as stated above, were bolted by a 1½ tie bolt just in front of the mortar block.

"The outside copper amalgamated plate is 10 feet long with no intermediate drops in it. It is turned up for 1½ in. at each long side, in order that it may be more perfectly cleaned up after each test. It is carried on a table which is supported by four heavy standards which are embedded in two concrete blocks in front of the mortar. Thus the outside plate may be given any desired slope, from one inch per foot to two and a half inches per foot, and is absolultely independent of the mortar. No jar is communicated to the plate from the mortar; and when desired the plate can be easily slid away so that one can work with perfect freedom at the foot of the mortar.

"The mill is driven by a four horsepower, 220-volt, three-phase induction motor. This is provided with external reactance, so that the speed can be varied within wide limits. The motor has a rawhide pinion to minimize the noise of the reducing gear as much as possible.

"This stamp mill was designed primarily for the instruction of mining students, but it can also fulfil other purposes. It is very seldom that a stamp mill is designed to exactly fit the ore that is to be treated. Usually it is well known whether the ore is free-milling or refractory, and it is determined fairly well beforehand what the whole treatment is to be. But the mortar is often designed after some other leading pattern, which is modified to suit some prejudices of the manager of the property. Such a mill as the one outlined above could be made of the greatest service in scientifically testing the ore for a new property to determine the broad lines on which the milling practice should be carried out, and to plan the shape of the mortar, height of drop, etc., according to the results. There should be no difficulty in arriving at very accurate approximations of the best practice for a new ore if enough careful testing is done with the small laboratory machine."

ASSAYING LABORATORY

The four h.p. motor for driving the mill was presented by the Canadian Westinghouse Mfg. Co.; the timbers for the battery frame were donated by Mr. G. J. Partingdon, Jr.; and I. Matheson & Co., of New Glasgow, N.S., furnished the iron work of the mill at cost.

The ore for the stamp mill is broken in the 4 in. by 6 in. Blake crusher, and wheeled in barrows and dumped into the hopper of the Challenge feeder. Thence it goes through the mill and flows down over the plate into a concrete sump. If the tailings are to be concentrated they are pumped thence to a reservoir near the ceiling,

made of an old molasses hogshead, inside of which is a stirrer run by a rope from the main shaft. This stirrer keeps the sand from settling and clogging the discharge. The pulp runs over the Wilfley, the tails going to two large concrete settling tanks in series, each 8 x 4 ft. and 5 ft. deep, and the clear water running to the city sewer. The heads and mids each go to their own settling tank, and the overflow of each is run to the large settling tanks.

Nearly all laboratories in their infancy have had to start in a small way, and have demanded much time and effort from him who has been fortunate enough to first establish them. This mining laboratory possesses nearly all the important types of machines with which

ASSAY FURNACES

the student should be thoroughly acquainted before he starts the practical life of the professional engineer, and it possesses as good a stamp mill for laboratory testing as the author is acquainted with. The laboratory is not as completely equipped as would be desirable for extended research. It is the strong belief of the author, however, that lavish equipment has often led to the confusion of the student, instead of a good, thorough acquaintance with a few important types, and thus the object for which the laboratory is intended is defeated.

The whole laboratory as installed at Dalhousie College has cost about $6,000, plus much time and effort. The results have amply repaid those most interested for the time and labor that they have put into its completion.

FASHIONS IN MINING

J. C. GWILLIM.

Time and place have many values in some phases of mining, quite out of proportion to the value of the commodity involved. Everyone interested in the speculative side of mining feels that there is a time to buy and a time to sell, and the chief concern is to choose these times aright. The general public knows nothing of productive values, and does not really speculate upon them, but upon the optimism of the hundreds or thousands who are interested in seeing the market rise.

A piece of ground adjacent to a bonanza acquires value in much the same way as a piece of real estate in a desirable neighborhood. This idea appeals to the ordinary man, but as a rule there is nothing of real value in it. There are reasons sometimes for the expectation of value; but these are not due to proximity, but to geological conditions which can be understood by very few people. Given two pieces of blank, unprospected ground, the one adjoining a known deposit is preferable to one in no such proximity; both are far more speculative than the piece of real estate. Concerning the fashions in mining, these are as carefully nursed as any fashion of dress or taste of the times. A likely field is pushed forward at first by some real merit, then by wide and subtle advertisement. Men become financially interested in the camp, their friends also come in; there is a good opening for exploitation and inflation of values; property and shares acquired by gift or small payment are talked up until the general public and those who sell to them become interested. Everything combines to make a rising market. Friends have made money; every man who has a dollar in the camp becomes an optimist, and so the fictitious values roll up. The press, the public and the people in the camp itself cannot abide the man who says a word to cool the enthusiasm, so very little on that subject is said. The experience of Southern British Columbia during the decade from 1890 to 1900 illustrates history of a mining boom. Whilst money was pouring into the country and a host of exploiters found themselves busy in keeping up the good times, people lost sight of the inadequate returns from the mines. Later on it was conceded that the costly development would bring about the required production; but before that time the subscribing public ceased to put up more funds, and mining, from the point of view of a great many people, had gone to pieces. Concurrently with the exodus of the brokers, migratory experts and all that floating aggregation which follows a boom, real mining began to pick up. Only properties of merit could stand the withdrawal of outside funds. Many of these even had to cease operations because of the mistrust caused by misrepresentation.

After the Kootenay was dead, in the opinion of those who lived by the money coming in from the outside, and the population had diminished, the production and money coming out of the mines still went on increasing until it is now double that of the best days of the mining boom. At the present time it is much harder to sell a property of real merit than in those days to sell a piece of ground from a few assays. Hundreds of claims held at high figures in 1896 to 1898 have lapsed into Crown lands for want of representation. Yet the mining industry is in a better condition than at any previous time, as far as genuine mining is concerned, and the best interests of the people who intend to make these districts their homes. Ontario itself has cut its teeth in various camps for the last forty years, and in some places has found something to masticate after that process had been endured. Gold, copper and lead have all had a run; there are reports of twenty to forty years ago fully as optimistic and as groundless as those of to-day, upon properties which have now a strong second growth of timber in their excavations. Silver is now a fashionable metal, and a few traces of it can raise financial support. Many of those who are now interested in the phenomenal values of the Cobalt camp may not have even heard of another silver camp in Canada, which, without ever figuring to much extent on the stock market, has produced over twelve million dollars in silver and six million dollars in lead in the last ten years. This has come out of an area in the Slocan of British Columbia, not very much larger than the Cobalt camp; but that B. C. camp, from the point of view of the broker and the public, is decidedly unfashionable.

From another point of view the men and money going into the popular camps does much good, by stimulating industry and development to an extent which would be impossible with the cautious policy of conservative mining. If there are assets in the way of natural resources, these have a chance of discovery and development which they might not have for a very long time, and time alone will show who gets the benefit.

SUMMER MEETING OF A. I. OF M. E.

PROPOSED ITINERARY OF ONTARIO VISIT.

As is announced in another column, the American Institute of Mining Engineers is to meet in Toronto during July. The Toronto meetings will be held at the King Edward Hotel commencing July 23rd. The probable itinerary of the visitors is outlined in the letter from Dr. Miller to Dr. R. W. Raymond, the Secretary of the Institute.

The American Institute of Mining Engineers has a membership of over 4,000. The names of its president and secretary are familiar to mining men all the world over. Mr. John Hays Hammond, the president, is one of the most prominent mining engineers on the continent. Dr. Raymond, who for twenty-six years has held the position of secretary, is an integral part of the Institute. He has devoted his rare abilities almost exclusively to the service of the society. The following letter is self-explanatory:

Copy of letter from Dr. W. G. Miller to Dr. R. W. Raymond:

Dear Sir,—I offer the following as a provisional programme for the meeting of the Institute at Toronto in July, and should like to have your criticisms on it. It will serve as a basis for the work of our local committee.

As the New York trains arrive in Toronto in the morning, it being a night run from New York to Toronto, I suppose a session of the Institute could be held on the afternoon of Tuesday, July 23rd. The other two of the three sessions which you desire to hold might be held on Wednesday forenoon and Wednesday afternoon.

You will see from the programme that I am suggesting only two days' stay in Toronto. My reason for this is that the meeting takes place in mid-summer, and cities are not the most attractive places at that time of the year; moreover, I should think that many of the members of the Institute would prefer to spend the time in the northern mining fields and at some of our northern summer resorts, rather than in the city. However, if you think Thursday should be spent in Toronto, this can be arranged for.

You will also see that I suggest that the address of welcome be given on Tuesday evening rather than at the opening of the session. This would give more time for the addresses, and if they are given in the Parliament Buildings more room will be available.

TUESDAY, JULY 23RD.

Forenoon—Arrival of members of the Institute in Toronto.

Afternoon—Session of the Institute.

Evening—Reception, with addresses of welcome from representatives of the Government of Ontario, City Council, and others in the Parliament Buildings, Queen's Park. Light refreshments.

WEDNESDAY, JULY 24TH.

Forenoon—Session of the Institute.

Afternoon—Session of the Institute.

Evening—Leave by special train for Cobalt at about nine p.m.

If you consider this stay in Toronto too short, we might arrange for a trip by steamer across the lake to Niagara, or some other excursion or entertainment. However, many of the members will be coming to Toronto via Niagara Falls, and they will probably not care to make an excursion thither.

THURSDAY, JULY 25TH.

Forenoon—Arrive at Cobalt, where the members of the Institute and their friends will be met by the Cobalt Local Committee. The party will be sub-divided and will visit various mines during the day. Probably the party, if large, will be sub-divided into three, say, "A," "B" and "C." "A" will visit one mine while "B" is visiting another, and afterwards "B" will be given an opportunity to visit the mine already seen by "A" and vice versa.

Evening—A banquet or reception in the Opera House at Cobalt.

FRIDAY, JULY 26TH.

Forenoon—Visiting mines.

Afternoon—It will depend on the wishes of the members of the excursion as to how Friday will be spent. Mining men especially interested in Cobalt will probably desire about two days to look over the field. Other members of the party may be given a trip farther north on the Government railway, probably over the height of land towards James Bay if they desire, in order to see this newly-opened country, or a steamer trip on Lake Temiskaming may be arranged for. This would start from Haileybury, which lies five miles north of Cobalt on the railway. The party would leave for Temagami, 25 miles south of Haileybury, on the railway, either Friday afternoon or evening or Saturday morning.

SATURDAY, JULY 27TH.

Forenoon—Temagami, steamboat trip up the lake. It would probably suit many of the party to spend Saturday and Sunday at Lake Temagami. This summer resort has been opened only during the last three or four years. It is situated in the Forest Reserve and is surrounded by a virgin bush. There are three very good hotels at the lake—one at the station, one at Bear Island, eighteen miles from the station, known as Temagami Inn, and another, the Lady Evelyn, about thirty-five mlies from the station. These days could be enjoyably spent here, I think, and it would break the monotony of the railway trip.

If any of the members of the party desire to spend a longer period at Cobalt, or wish to visit the new Cobalt silver field on the Montreal River, they could do so, and catch the excursion train at Temagami. This train could leave Temagami either Sunday evening or Monday morning. The run to Sudbury would take about five or six hours.

MONDAY, JULY 29TH.

Forenoon—Arrive Sudbury, met by local Reception Committee. Visit either Canadian Copper Company's mines and works or the works of the Hutton Iron Mine, which is situated twenty-five miles north of Sudbury on the railway. A reception or banquet would probably be provided in Sudbury on Monday evening. Part or the whole of Tuesday could be spent in completing the visit to the mines and works of Sudbury or to the Victoria Mines, west of Sudbury. On Tuesday evening the train would leave for Toronto.

I might say that from Toronto to North Bay the train would run over the Grand Trunk Railway a distance of 227 miles; from North Bay to Cobalt the run would be over the Government railway, the Temiskaming & North-

ern Ontario, the distance being 103 miles. The distance from North Bay to Sudbury is eighty miles.

Should members of the Institute desire to visit the mineral localities of southeastern Ontario, arrangements could be made to make the visit after the Cobalt and Sudbury trip was completed.

It is my intention to prepare a guide book for the use of the members while on this excursion in Ontario. This will give an account of the geography and geology of the districts visited, together with a sketch of the mineral industry in Ontario.

Yours very truly,

W. G. MILLER,

Provincial Geologist.

CORRESPONDENCE

We reprint below a copy of the report of Sectional Committee "A" of the British Institution of Mining and Metallurgy on the standardization of weights and measures. Mr. A. B. Willmott's letter appended deals with this report:

To the Chairman and members of the Central Standardization Committee:

Gentlemen,—The Weights and Measures Standardization Committee submit the following recommendations for adoption by the Central Committee:

1. That the word "ton" shall represent a weight of 2,000 lbs. avoirdupois (29,166.6 oz. troy); that the use of the terms "cwt." and "qrs." be abandoned, and that fractions of a ton be expressed either in pounds or in decimals of a ton.

2. That the "miner's inch" be understood to mean a flow of 1.5 cub. ft. of water per minute.

3. That the word "gallon" be understood to mean the Imperial gallon of 10 lb.

4. That all temperatures be expressed in degrees Centigrade.

5. That gold and silver returns be expressed in terms of fine gold and silver, and not as "bullion."

6. That gold contents of ores, etc., be expressed in money values as well as in weights; and that in this connection the standard value be taken at 85 shillings, or $20.67 U. S. currency, per troy ounce fine gold.

They also suggest that the following questions be appended to any memorandum that may be issued to the members of the Institution embodying the above definitions:

(a) Do you consider the general adoption of the Metric system of weights and measures to be feasible in mining and metallurgical work, or would this in your opinion lead to undue dislocation?

(b) Have you any suggestion to make as to weights and measures other than those already dealt with, which require exact definition?

The question of the adoption of Metric standards has engaged the attention of the committee, as the present movement in that direction in other branches of industry rendered it, in their opinion, inadvisable to ignore it entirely.

The feeling of the Committee, however, is, that while the question should be brought to the attention of the members, it would at present be quite inexpedient to advocate the general adoption of the Metric system in mining and metallurgical work.

On the other hand, an attempt to decimalize existing weights and measures is considered to be a step in the right direction, and as tending to bring about a desirable simplification.

I am, gentlemen,

Yours obediently,

(Signed) H. LIVINGSTONE SULMAN,

Chairman of Sectional Committee "A," Weights and Measures.

December 13th, 1906.

Sault Ste. Marie, Ont., April 25th, 1907.

Mr. C. McDermid, Secretary Institute of Mining and Metallurgy, Salisbury House, London, E.C.:

Dear Sir,—Taking advantage of the opportunity which you have given to members of The Canadian Mining Institute to express their opinions on the proposals made by the Standardiization Committees, I beg to make some suggestions. I would have much liked to see some advanced position taken by the Weights and Measures Committee in regard to the metric system. I quite agree that it would be "inexpedient to advocate the general adoption of the metric system" at the present time. I feel, however, that the majority of engineers favor the ultimate adoption of this system, and believe this can only be accomplished by gradual change. Probably no more opportune time could be found for the partial introduction of the system than when the present standardization is being considered. We have no less than four systems of weights in use in English-speaking countries, namely, Avoirdupois, Troy, Apothecary and Metric, and to add to the confusion several of our weights have dual meanings, as in the case with ton, pound and ounce. No one will deny the advantage of uniformity, and a very considerable number, and I believe the majority, of those giving attention to the matter would favor the metric system. My thought is that so far as weights are concerned, engineers might agree to adopt the metric system at once, and ten years from now, when the metric system of weights will have become familiar to the general population, it will be time to urge the adoption of the metric system of measures. Metric weights can be adopted so easily, and with such slight dislocation of present conditions, that I trust the committee will give this suggestion full consideration. I would suggest a change of the recommendations of the committee to read as follows:

1. That the unit of weight shall be the metric ton, representing 2,204.6 lbs. avoirdupois. That the use of the terms "hundredweight" and "quarters" be abandoned, and that fractions of a ton be expressed in decimals.

2, 3, 4, 5. As given.

6. That the metric system of weights shall be substituted for troy weights in relation to precious metals. That the gold contents of ores be expressed in money values as well as in weights, and that in this connection the standard value be taken at 2,733 shillings (?) per kilogram, or $664.60 (?) U. S. currency per kilogram.

7. The metric system of weights be substituted for the karat and fractions in the weighing of diamonds.

All of which is respectfully submitted.

Yours truly,

A. B. WILLMOTT.

In a recently issued bulletin of the U. S. Geological Survey a statement appears giving the obligation required of employes or members of the staff. These are as follows: He must refrain from publishing facts of a confidential nature, learned in the course of his duties. He further pledges himself not to testify in any mining litigation before the United States, state or territorial courts during his employment on the survey; and for three years after the termination of such employment not to act as expert in mining litigation concerning properties in any district in the United States, upon which he shall have made a full or partial report under the employ of the survey, provided that a period of ten years shall not have elapsed since the completion of the field work to which he was a party and upon which his expert report is based. Confidential geological data collected in the course of mine or district investigations, must not be published without consent of the proper authorities directly interested in said data, and is to be used by the collating or investigating geologist only as a basis for conclusions and generalizations.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Up till the 15th of May it could not be said that coal shipments by water had really, that is, actively, begun for the season. This is a late year. In May of 1906 the Dominion Coal Co. shipped 330,000 tons. They will scarcely do that this May. Predictions have been numerous that the Nova Scotia shipments of coal during 1907 would be much larger than in any previous year. I have myself taken part in the pastime of prophesying. About this time we should be getting doubtful as to the fulfilment of our predictions. But no; though appearances are for the nonce against us, we are quite cheerful. The shipments of the six of the larger companies for the first third of the year should have a depressing effect, but instead all are big with hopes. For the four months of the year four of the companies suffer decreases in shipments, viz., Dominion Coal Co., 18,000; Intercolonial and Nova Scotia Steel and Coal Co., about 2,500 each; while the Cumberland Railway and Coal Co., from a series of troubles, has gone all of 50,000 tons behind. The decrease from these four companies is 74,000 tons. The Acadia Coal Company, on the mainland, and the Inverness Railway and Coal Co., on the island, relieve the situation somewhat, the former having an increase of 12,000, and the latter of 21,500 tons, over the four months of 1906. The net shortage for the four months is therefore 40,000 tons. From the first of June the shipments will be on a scale much larger than in any previous year.

Though last year's shipments were the largest by far on record, the profits of the operators were microscopical. Indeed, it is asserted that of all the companies operating only three showed a balance worthy of the name of profit. It is not, then, to be wondered at if the price of coal has been advanced in Montreal, and the St. Lawrence points generally. And yet this increase in price will not be a means of making the operators wealthy, for the reason that the biggest proportion of the quantity sent to Montreal is on long time, that is, three-year contracts, and that means the same price as last year. In fact, the only company that I know of that has no three-year contracts—I refer to companies shipping by water—is the Nova Scotia Steel and Coal Company. Of course, all of the companies will have some small orders to fill at the increased rate.

Land shipments are greatly hindered by a scarcity of cars. The mainland collieries could almost double their outputs could cars be supplied them in sufficient numbers. This complaint of scarcity of cars is not new, and the wonder is that the I. C. R. authorities do not make provision for increased rolling stock. The late shipping season is given as a reason for the exceptional scarcity at the present time. Hundreds of coal cars are standing loaded with lumber which should have been loaded long ago. The ice has delayed the arrival of steamers on which the lumber is to be shipped. And yet, when all is said, the I. C. R. is to be censured for continued scarcity of cars.

The complaint at some of the collieries still continues as to the scarcity of labor. This scarcity handicaps outputs in some instances. For several years the Dominion Coal Co. has suffered much from a scarcity of loaders, that is, men to load the coal into the pit tubs after it is taken down. Extraordinary efforts have been made to overcome this difficulty this year. In order to secure loaders, special agents were sent to Italy, Belgium and other countries, and the result is that a large number of muscular foreigners have recently arrived. The companies not only suffer from a scarcity of labor, but from the irregularity of the men in coming to work. It is not unusual for twenty-five per cent. of the employees at a colliery to be off work on certain days. Many in the spring go fishing and farming, while in the summer many go frolicking. This is a sign that wages are good; and the funny thing is that these same would be the loudest grumblers were the idleness enforced from scarcity of employment. The collieries will give employment directly to 12,000 men this summer, and nearly as many more indirectly.

The biggest thing in the way of development on the mainland is the opening out of the Allan shafts. Naturally owing to the immense thickness of the seam—forty-five feet to fifty feet—development proceeds slowly. This is a big undertaking, from which big things are expected once the seam is fully opened out. It may be some time yet before the anticipated 2,000 tons per day is reached; at present the output is between two and three hundred tons per day. There should be a steady enlargement of this quantity. Nova Scotia can not only boast of the biggest seam of bituminous coal at present being operated, but of the longest straight, high-angled slope—if I am not mistaken—in the world. The Drummond slope of the Intercolonial Coal Mining Company is now down a distance from the surface of over 7,500 feet, or say a mile and a half. The pitch of the seam is over 21 degrees; therefore the superincumbent weight of the strata at the face of the coal must be something tremendous. The "squashing" almost flat as pancakes of the heavy sticks put in to support the roof bears testimony to this. To take a rake of boxes from the face of the slope to the surface occupies eleven minutes, and yet this colliery can hoist as much coal as when the slopes were less than half the distance. This has been made possible by the employment of heavier haulage engines and thicker steel rope. Twice as many boxes come up on a rake as, say, two years ago. This colliery is over forty years old, and yet is producing yearly more coal than in its younger days. Mr. James Floyd's management of the colliery has up to the present been an unqualified success. In Mr. Blue, as mine manager, he has an able lieutenant.

The men and management at Springhill are to have a trial of the new Industrial Disputes Bill. The men made application to the Department, and have named as their arbitrator Mr. R. B. Murray, of Springhill, while the company has named Mr. Archibald, C.E. I have not heard if they have agreed upon the third man. It is thought that the men believe they have a good case, otherwise they would not have taken the initiative. Our miners are much more reasonable than are the miners in the West. That may be due partly to the fact that they have home leaders, and not foreigners for guides. The P. W. A. is perhaps as desirable a trades union as any on the American continent. Of course, it has its critics, but these are mostly men with Socialistic leanings. To them the P. W. A. is not aggressive enough, which is another word for clamorous. That is, however, the beauty of the P. W. A. Its chief and only paid officer does not need to go round the collieries setting off fireworks in order to make his salary secure. Some would prefer that the P. W. A. was not a semi-secret society. Why should its doors be open to non-contributors? The managers meet and their meetings are not open to everyone, and why should the meetings of the P. W. A.? The meetings of the P. W. A. are for stockholders, so to speak, only, and why should they not be? We ought to be glad that the Western Federation of Miners obtained no footing in Nova Scotia. Wherever in British America that society has found a place it has left discord and strife in its trail.

The British papers have been crowing over an output of 3,865 tons in a day from a colliery in Derbyshire. It is claimed that this beats the world's record. Scarcely. From Dominion No. 2 shaft of the Dominion Coal Co. there was hoisted in a day of ten hours no less a quantity than 4,603, or over 700 tons more than what is claimed as the best day's hoisting in the world. Nova Scotia may be a small place, but for its size it does some wonderful things. It has a coal company that can hoist more coal, ship more and unload from its steamers more coal than any other coal company on the wide continent. And we are only at the beginning of things. It is only ten years since the coal trade really began to grow, and at the rate it is expanding it will be of gigantic stature by the expiry of another ten years.

ONTARIO.

Cobalt, May 16.—The "hugger-mugger" fashion in which Cobalt stocks are introduced in England has been annoying the London Times. Advertisements of the Cobalt Central Company aroused the wrath of the Thunderer, and it proceeded to ask some inquisitive questions. "How much was paid for the properties, and how much working capital has the company?" asks the Times. It then goes on to say that British capital may well fight shy of a field of exploiters who adopt such questionable methods of calling attention to it.

No specific reply can be obtained at this end of the line to these caustic criticisms, but a disposition is shown to give visitors access to the property. While the company holds something like 220 acres of land, only a small portion of that acreage is under development, the section adjoining the Nipissing, and including the Big Pete mine. A 100-foot shaft has been sunk there with considerable drifting, several good veins have been struck, and a concentrator is in operation treating the wall-rock, which is rich in low grade ore. Up to date three shipments have been made, but none were full carloads. The capitalization of $4,000,000 would seem to be quite ample in view of these results. This capitalization is advertised as being low for the acreage, but as the capital is being used for the development of only a small part of the holdings, the point of this argument is not readily apparent.

That great minds sometimes run in the same channel is shown by the fact that one of the local papers in the Cobalt field is asking questions almost as pertinent as those of the Times. The "Haileyburian" wants to know why the directors of the Green-Meehan do not issue statements telling their shareholders a few facts. The mine is a good one, says the Haileyburian, and ought to make money. Why cannot the people who have invested their money be given some idea where they stand?

No adequate reply can be obtained to these questions either, but at the mine a visitor is shown a very likely looking property. Up to the present all work has been in an open cut, by which fairly good results have been obtained. A strong vein can be followed the entire length of the cut, and the ore taken out runs at a good average. A complete plant is now being installed and a much larger production is promised for the summer. A shaft is being sunk from the end of the cut, and drifting and stoping will soon be possible.

Without attempting to pass judgment upon these criticisms, it may be said that whatever adverse comments have been made regarding this field have been based on failure of promoters to take the public fully into their confidence. Glittering generalities constitute a big part of advertising methods on this side of the ocean, but sometimes they fail to convince even the home folks, let alone those in foreign parts. There have been some big disappointments in the Cobalt field, and it is natural the public should be a bit chary. Candor alone will win renewed confidence.

Snow, rain and rising temperature have been received with great gladness here, for it seems certain that the long-delayed spring has at last arrived. All signs point to the breaking up of the ice in Lake Temiscaming within a few days, and the rapid opening of the rivers. Snow is still heavy in the bush, and the lakes in the north country are still covered with a thick coating of ice, but a few more mild days will make a great change. Then will come the rush north. Hundreds of prospectors are lined up along the trails, and hundreds more are ready to make a quick start from the settlements. The "oldest inhabitant" is not so very old that he can remember a season when the ice went out so late. Fifteen years ago it went out as late as the 15th, but this year it is still here on the 16th. As a result prospectors have been much handicapped, and now have but a short season before them.

Opinion is divided as to which of the northern fields will produce the greatest results this summer. First on the list is Larder Lake, which will no doubt draw the larger number. Much is expected of this territory, and it will take a good deal to fulfill expectations. That gold is there is not doubted, but to what extent will hardly be known before autumn. The Montreal River is better known, and confidence is felt in big returns from there. That country has been more thoroughly prospected than Larder Lake, and considerable work has already been done on the development of some of the claims, notably those of Munroe and Saville, which were among the first staked and the first recorded from that section. The Abitibbi is also going to draw some prospectors this season, and already some very rich specimens of gold-bearing rock are shown quietly by men who have returned from there.

That there is to be a marked increase in the production of the camp is indicated by the figures for the first three months. Up to April 1st about 3,000 tons of ore were shipped. There were 26 mines among the shippers, and as six sent out only one car each, the remaining ten must have shipped an average of about nine cars each month. In 1904 the camp produced 158 tons of ore; in 1905, 2,144 tons; in 1906, 5,129 tons. Now with a record of 3,000 tons for only three months of this year, it is evident that the output for 1907 is to be greatly increased. There are several new mines among the shippers, whose output will increase, and several others will make their first shipments soon. The production at some mines has been curtailed owing to changes of equipment in progress, and at others the product has been held back in hopes that market prices would improve. That so much should have been shipped under these conditions gives some idea of what may be expected during the year.

During the past week some rich strikes have been made by some of the well-established companies. Two finds of native silver veins were made on the Buffalo, and Manager Jones went to New York and Buffalo with good reports for his directors. At the Trethewey nearby two promising leads have been reached in trenching. At the Nova Scotia another vein, two inches of which is solid silver, has been reached at the 20-foot level. At the Red Rock a four-inch vein of native silver is said to have been reached. The Cobalt Central has struck another vein similar to those found recently. A two-inch vein very rich in silver was reached at the Temiskaming.

Among the visitors now in camp is Mr. Eric H. Rose, the senior member of the firm of Rose, Van Cutsem & Co., bankers and brokers, London, England. This firm floated the stock of the Townsite Mine, which is owned almost entirely in England, and is interested in other Canadian and American enterprises. Mr. Rose expresses himself as well pleased with the progress made not only at the Townsite, but in the camp generally, since his last visit. He says English interest in Cobalt stocks is increasing, and that capital from the other side can be drawn to Canada if safe and conservative methods are followed.

Another English visitor is Mr. R. Jackson, a stock broker in Leeds. He has handled Cobalt stocks for a year or more, and says investors in the North of England are awakening to the opportunities offered by this field.

During the past week Mr. W. F. Mitchell has been in the camp, coming direct from Los Angeles, Cal. Mr. Mitchell is a large owner in the Casey Mine, and is part owner of gold mines in California and coal mines in Nova Scotia.

The machinery at the Casey Mine was started Monday, in presence of several of the directors. Hand work has been in progress all the winter, and conditions are favorable for rapid production now that the plant is complete.

The O'Brien Mine recently shipped a 32-ton car that brought $125,000 at the smelter. This is at the rate of nearly $4,000 per ton, and sets a new record for the camp.

The big vein at the Temiskaming is holding its own in splendid shape. It is almost two feet in width, and runs 12,000 ounces per ton and upwards.

The main shaft at the Temiskaming and Hudson Bay Mine is now down 40 feet. The big vein is holding its width, and considerable high-grade ore is sacked ready for shipment.

The Nova Scotia Mine, where some remarkable slabs of silver have been found, has another car of fine ore ready for shipment. Steady production now seems assured.

A car of rich ore is ready for shipment at the Kerr Lake Mine, and with the completion of the new plant there should be large shipments from now on.

Mr. Joseph Houston, formerly in charge of the O'Brien Mine, is now in charge of the Right of Way, where a larger plant is being installed.

Mr. George N. Rounds, a mining engineer from Trinidad, Col., is in charge of the Sutton Bay Company's claims on the Montreal River.

Mr. Rupert Simpson is developing the Sutton Bay Company claims on Sutton Bay. He was formerly engineer in charge at the Townsite.

Mr. John A. Macdonald, formerly in charge of the Silver Mountain Mine, is now superintendent of the Foster Mine.

In spite of the numerous "newspaper" reports of the closing of the Foster Mine, work is progressing rapidly, and under the able management of Mr. H. V. Adler, systematic development work is being done and high-grade ore is being taken out daily. Mr. John McDonald, formerly of the Trethewey, has been appointed mine captain.

Another valuable vein has been struck on the Temiskaming Mining Company's property. One of the richest cars of ore from Cobalt was shipped by this mine last week.

The mine owners and other mining men must regret the absurd articles sent out of the camp by the numerous reporters that are loose in the camp. The absurdity of some articles prove amusing, but when the mining interests are sacrificed for "copy" and all sorts of reports are published, it is about time that competent newspaper men were procured for the work.

Every train brings its quota of prospectors and those interested in the field. The Montreal River is now open, and hundreds have gone into that district already, and it would not be the fault of the men if rich finds are not made before fall. It is safe to predict that by the time the river is once again frozen over the silver field will have been extended many miles.

Mr. R. L. Borden, leader of the Conservative party in the Dominion Parliament, was in Cobalt last week for a few days, and was greatly pleased with his visit.

Mr. R. R. Gamey, M.L.A., was in the camp last week looking over his numerous mining interests.

Mr. F. C. Loring of the Trethewey Mine has returned to the camp.

Mr. D. B. Rochester, manager of the Cobalt Lake Mining Company, was in Toronto for a few days last week. Mr. Fralick, mining engineer for the company, is in Ottawa for a business trip.

The Coniagas Concentrating Mill is being constructed, and Mr. Fraser Reid, formerly of Craigmont, will superintend the running of it.

The Mining Inspectors are in town, prior to their departure for the different fields. Owing to the energetic prospecting carried on during the winter months, they will have great difficulty in coping with the situation, but the Department have taken great pains to procure the best possible men, and the prospectors have every confidence that their interests will be well looked after.

Much satisfaction is expressed in camp over the appointment of Professor Mickle as Mines Assessor for the Province. Professor Mickle is especially suited for the position, being a man of recognized integrity, and also one who is thoroughly acquainted with the mining situation of the Province.

GENERAL MINING NEWS

BRITISH COLUMBIA.

The Payne Mine, now controlled by Montreal capital, is to be re-opened. In its day it yielded nearly a million and a half dollars in dividends.

The Wellington Colliery Company, of Cumberland, has closed a contract to ship 20,000 tons of coal to Nome.

The Slocan district is showing decided signs of revival.

Mr. Neil McEachren is to drive a 50-foot tunnel on his large lead of free milling quartz on the west bank of the Columbia River, between Revelstoke and Arrowhead.

The main shaft of the Centre Star Mine, Rossland, is completed to the fourteenth level, and a pocket has been cut below this level. The new hoist, ordered on May 4, 1906, is only now ready for operation.

Electrical locomotives are now being used on the third and eleventh levels of the War Eagle, and on the fourth level of the Centre Star. They are giving satisfaction.

Atlin, B.C.—A new company has been formed to work the placer gold deposits of Otter Creek, near Surprise Lake. The property is about five miles in extent. The new company's name is The Otter Hydraulic Gold Mines Company. It will be under the joint management of Messrs. W. R. Jamieson and H. Malvin.

The Cariboo Mine, Camp McKinney, has been unwatered to the 400-foot level, and new timbers have been put in. Tracks are being laid in the drifts and cross-cuts. Mining will be actively started in the middle of May, when 10 stamps will be put in operation.

The tunnel on the Nicola Valley Coal and Coke Company's property at Coal Gully, has been driven in over 600 feet. The Company is supplying the railroad with 100 tons per week.

On the west side of Bowen Island, 18 miles north-west of the City of Vancouver, a copper property is being worked. A shaft 6 x 9 feet is being sunk. Part of the areas are on the water edge. A group of Winnipeg capitalists are the prime movers in floating a $1,000,000 company to operate these claims.

A seam of coal has recently been discovered in the Nicola district a few miles south of the town of Nicola.

A 200-ton mill is being erected at the Blue Bell Mine, operated by the Canadian Metals Company. Mr. S. S. Fowler is acting as consulting engineer, and Mr. J. C. Dufresne is superintending the work.

Dr. J. Bonsall Porter, of McGill University, visited Greenwood on May 10th.

The Bertha Consolidated Company, whose properties are situated in the Kettle Valley, have struck ore in their new tunnel.

G. B. McMillan's action against A. D. Wheeler and wife for $25,000 commission on the sale of the Krao Mine, was dismissed with costs by Mr. Justice Clement.

ONTARIO.

Cobalt.—Owing to the condition of the roads shipments from Cobalt have been somewhat restricted of late, but on all the principal properties development work is being very actively prosecuted, and interest in the district in general is being well maintained. For the four months ending April 30th, production aggregated 6,742,667 pounds, or nearly two-thirds of last year's entire output. The most important shipper has been the O'Brien, followed closely by the Nipissing, although the latter, it should be added, has been prevented from sending out ore recently on account of the breaking up of the ice in Cobalt Lake. The Cobalt Lake Mine is now about to commence shipments, and two carloads of ore have already been sacked, while another carload of smaltite will be ready to ship towards the end of this month. The Coniagas continues to make an excellent showing, and is now working six veins, from which some very high-grade ore has been mined. Some 1,500 feet of drifting and cross-cutting has been done at the 75-foot level, while it is expected that the new concentrator, having a capacity of 100 tons daily, will be completed for operation before the close of the month. A new strike

is reported to have been made recently on the Buffalo, a rich new vein eight inches in width having been uncovered. The installation of a concentrator at the Trethewey is under contemplation, as there is a large tonnage of relatively low grade material which might thus be profitably treated. The Erie-Cobalt Company has ordered additional machinery, and work is being carried on with double shifts on the Lorraine, where the shaft has reached a depth of a hundred feet. A plant is also to be installed on the Temiskaming and Hudson Bay Company's property, while a five-drill compressor and steam hoist have been installed at the Wabo. At Kerr Lake the Jacobs Mine is said to be looking exceptionally well. The report circulated that the Foster Mine had closed down was entirely foundationless. The mine is being systematically developed, and appears to be under honest and capable management. At the Nova Scotia some 500 feet of drifting has been done at 60-foot level, in addition to work at the 110-foot level, and on Shaft No. 3. It is expected that a shipment will be made shortly.

Larder Lake.—The inclement weather has to some extent checked the rush of prospectors to Montreal River and Larder Lake, but it is expected that before the first of June travel will be unprecedented. A stamp mill has been ordered for the Blue Bell Mine, at Larder Lake, which property will be under the direction of Mr. W. E. Hotson, a mining engineer of New York.

The following inspectors have been appointed by the Ontario Mines Department. No especial districts have been assigned to each. They will work generally, as need arises, over the whole Province: Mr. A. H. A. Robinson, Mr. A. G. Burrows, Mr. G. C. Mackenzie, Mr. James Bartlett, Mr. G. R. MacLaren, Mr. David Houston, Mr. C. W. Murray, Mr. R. Irwin, and Mr. E. Wade.

The Grace Mine, in Eagle Lake district, will be re-opened soon. Mr. J. H. Caslor, of Buffalo, is putting up a stamp mill. The mine is advertising for miners and carpenters.

The 35 feet by 64 feet power house at the Nancy Helen Mine is completed, and the foundations for the machinery are ready. A hundred horsepower gas-producer is to run an engine for a six-drill compressor.

A discovery of pyrrhotite is reported from the north side of Lake Wahnapitae. It is said to carry 3 per cent. nickel and 1 per cent. copper.

NOVA SCOTIA.

The Nova Scotia Steel Company is about to commence operations at the new colliery at Point Aconi, which will be known as Sydney No. 6.

In an interview at Montreal, Mr. F. P. Jones, of the Dominion Iron & Steel Co., is reported to have stated that an increase of 50 per cent. in production from the company's works is anticipated for this year, and it is thought that the monthly average will reach 30,000 tons.

The Dalhousie-Kings School of Mining, Glace Bay, C.B., has closed for the summer, after a successful season's work. The average attendance was 35. Instruction was given in English, mathematics, chemistry and surveying.

It is understood that the North Atlantic Collieries, Limited, will operate areas in and around Port Maria. The company has 36 leases. There are six seams of coal running through these areas, and they possess a very large estimated tonnage. The present shaft of the Gowrie and Blockhouse will probably be utilized. The leading directors of the company are Messrs. B. F. Pearson, of Halifax, George E. Drummond, of Montreal, and H. M. Whitney, of Boston. The company was organized in 1903, under the Joint Stock Companies' Act of Nova Scotia.

The Nova Scotia Royal Gazette of May 8th makes formal announcement of the appointment of Mr. Frederick H. Sexton to the Directorship of Technical Education in Nova Scotia, under the provisions of the Act passed at the last session of the Legislature.

Sydney No. 3 colliery, owned by the N. S. Steel and Coal Co., is to be operated on single shift. General Manager T. J. Brown believes that the cost of production will thus be considerably lessened.

It is reported that a deposit of infusorial earth at St. Ann's, Cape Breton, is to be worked again. It is owned by New York capitalists.

The coal-washer of the Londonderry Iron and Mining Company, Londonderry, N.S., was destroyed by fire on the morning of May 8th.

Two electric pumps are working in the Hub Colliery, Glace Bay. The Hub was flooded last winter on account of a fire. Hoisting cages have been installed, and the work of cleaning up is proceeding expeditiously.

The Nova Scotia Steel and Coal Company is pushing the work of shaft sinking on Sydney No. 4. It is expected that this mine will start producing coal during the coming autumn. The company owns the land in the vicinity of the mine.

ALBERTA.

From Edmonton the report comes that gold strikes have been made on Little Smoky River, beyond Yellow Head Pass.

EXCHANGES.

The Mining Investor for May 13th has been received.

Mining Engineering (London) for May has been received.

The Coal Trade Journal, May 15th, notes the strong position of the anthracite coal market.

In the Mining and Scientific Press, May 4th, Mr. T. A. Rickard writes of "Great Gold Mines."

The Journal of the Franklin Institute for May gives an able paper on the "Modern Locomotive."

The Science and Art of Mining, May number, contains an instructive article on "Indian Coal Fields."

The Mining World, May 11th, gives a paper on the "Determination of Silica and Alumina in Iron Ores."

South African Mines, April 13th, in an article on "The Metallurgy of Gold Fields' Mines," specifies some of the advantages of tube mills.

The Engineering and Mining Journal, May 11, presents a copiously illustrated descriptive article on "Magnetic Separation of Iron Ore in Sweden."

In the May 18th number of the Engineering and Mining Journal is an excellent description of "The Tungsten Deposits of Boulder County, Colorado."

The Mining Journal (London), May 4th, has been received. In this issue Prof. William Gowland's presidential address before the Institution of Mining and Metallurgy is concluded. The leading editorial deals with "Railway and Mining Development in China."

The Maritime Mining Record, May 8th, makes some very caustic comments on certain pseudo-Socialistic writers who spread themselves in the daily press. Many of these "Socialists," the Record points out, are irresponsible babblers. The Record does well to scourge those silly people whose chief desires are first to see themselves in print and next to stir up strife.

The March number of our contemporary, The British Columbia Mining Record, has reached us. The Mining Record is, as usual, bright, clean and attractive. The March number contains an article on "Copper Mining—an Important Industry in British Columbia," from the pen of Mr. E. Jacobs, the managing editor. Mr. Jacobs exhibits in all his work a keen, incisive style and a remarkably thorough knowledge of all matters pertaining to the mining industry of the Province which his paper so ably represents.

PUBLICATIONS RECEIVED

Bulletin No. 32 (May 9th, 1907) of the Institution of Mining and Metallurgy, has its usual quota of excellent technical papers.

The Quarterly Bulletin of the Imperial Institute, Vol. V., No. 1, contains an exhaustive article on the occurrence of graphite. A previous article dealt with its uses.

Both bulletins are beautiful specimens of typography. They are profusely illustrated with photographs and with geologic maps and sections. Twenty-eight micro-photographs accompany the reports.

Bulletin No. 1. (New Series). New Zealand Geological Survey. "The Geology of the Hokitika Sheet, North Westland Quadrangle," by James Mackintosh Bell, M.A., Ph.D., F.R.G.S., assisted by Colin Fraser, M.S.C., Wellington, New Zealand, 1906.

Bulletin No 2. (New Series) New Zealand Geological Survey. "The Geology of the Area Covered by the Alexandra Sheet, Central Otago Division," by James Park, M.I.M.M., F.G.S., etc., Director of the Otago School of Mines.

These bulletins are of more than passing interest to Canadians, in that they have been prepared and issued under the direction of Dr. J. M. Bell, a graduate of Queen's University, and a nephew of that distinguished Canadian geologist, Dr. Robert Bell.

The general and economic geology of two important districts of New Zealand is carefully described. Dr. Bell has emphasized the economic side of his work as much as possible. The description of certain gold-bearing areas is extremely interesting. We shall, at an early date, have occasion to refer more particularly to this feature of the reports. Meanwhile we wish to record our pleasure in receiving such excellent examples of painstaking and capable departmental work.

"Notes on the Mineral Fuel Supply of Canada," a pamphlet from the Transactions of the Royal Society of Canada, has been received. Dr. R. W. Ellis, of the Geological Survey, is the author. This pamphlet will be the subject of extended notice in the next issue of the Canadian Mining Journal.

CATALOGUES AND TRADE PUBLICATIONS

Bulletin No. 12, issued by the Jeffrey Manufacturing Company, Columbus, O., is entitled "The Care of Electric Mine Locomotives in Service." This is virtually a manual of directions for practical men. The Jeffrey people signify their desire to put it in the hands of all engineers and mine managers. It is amply illustrated with photographs and diagrams.

From Allis-Chalmers-Bullock Limited, is received Bulletin No. 1410. The subject is the Gates Tube Mill for nut pulverizing in mining work. In South African gold mines the tube mill, as a profitable addition to the stamp mill, has made a permanent place for itself. Preliminary treatment of a gold ore in the tube mill increases the capacity of the stamp mill and gives an even product. The Gates Tube Mill, as manufactured by the above firm, is simple in construction and thoroughly satisfactory in service.

"The Deister Concentrator," Mr. C. B. Fitch, Canadian agent, is the subject of a small pamphlet issued by the Deister Concentrator Company, Fort Wayne, Indiana. The Deister occupies a floor space of eight feet square, and, crated for shipment, weighs 1,000 pounds. It requires but one-fifth horsepower, and is operated at a speed of 320 r.p.m. The main frame, supporting the driving gear, is of eight-inch channel steel, held together by steel plates. The table bases are made of the best grade of charcoal iron, so arranged as to prevent longitudinal motion. A wedge adjustment provides for tilting the table, which is supported in ball and socket bearings. The stroke and differential can be changed at will while the table is in operation. The deck (or working surface) is rhomboidal in form and is made of wood covered with linoleum. The surface measures 5 feet by 8 feet. The feed box extends the whole width of the deck, thereby ensuring even distribution of pulp. Alternate riffles extend to the extreme edge of the table, the intermediates being shortened. The riffles are arranged in groups, each group being separated from the next by a higher riffle, which has the effect of flooding the preceding group of riffles with a comparatively quiet body of water, in which fines and slimes readily settle and stratify. The advantage of this device is obvious. The movement of minerals is sidewise. The coarsest and heaviest minerals are expelled from the table within 18 inches of the feed and the lighter and finer minerals at points nearer the lower end of the table.

PERSONAL AND GENERAL

It is interesting to note that Canada's experience of the difficulty of securing and retaining the services of qualified geologists to undertake Government work is by no means unique. Thus Mr. S. F. Emmans, in a report of the United States Geological Survey, notes with regret "the increasing exodus of members of the economic force of the survey in consequence of their employment by large mining organizations at salaries much greater than those they have been receiving from the Government seriously impairs the efficiency of the work of this branch of the survey. It is only by years of practical experience in the field that the geologist, however excellent his preliminary training, becomes competent to carry on independent work in investigating a mining district, and the loss of trained men in this work is, for a time, irreparable."

The terms of the resolution recently passed by the House of Commons, providing for a bounty on pig iron and steel manufactured by electrical processes, reads as follows:

"That it is expedient to provide that the Governor-in-Council may authorize the payment out of the consolidated revenue fund of the following bounties on pig iron and steel ingots manufactured in Canada for consumption therein, when such pig iron and steel is the product of Canadian iron ores smelted in Canada by electricity, viz., on pig iron manufactured from Canadian ore by the process of electricity smelting during the calendar years: 1909, $2.10 per ton; 1910, $2.10 per ton; 1911, $1.70 per ton; and 1912, 90 cents per ton. On steel ingots manufactured by electric process direct from Canadain ore, and on steel ingots manufactured by electric process from pig iron smelted in Canada by electricity from Canadian ore during the calendar years: 1909, $1.65 per ton; 1910, $1.65 per ton; 1911, $1.05 per ton; and 1912, 60 cents per ton."

Apropos of the foregoing, that in Sweden, where about one million tons of iron ore, or one-fourth of the ore raised, is smelted in the country, electrical methods are becoming more and more general. The present demands for electricity may be estimated, according to Mr. E. Hammerstrom, in "Teknish Tidskrift," at 111,000 h.p. for iron smelting, 100,000 h.p. for railway working, and 320,000 h.p. for nitric acid manufacture.

Mr. S. F. Parrish, at one time manager of the Le Roi Mine, at Rossland, B.C., has opened an office as a consulting engineer at Tonopah, Nevada.

Mr. R. B. Lamb, late of Hedley, B.C., has been retained as consulting engineer by the Barnes-King Mining Co., of Kendall, Montana.

Mr. W. H. Jeffrey has resigned the superintendentship of the Crescent Mine, near Greenwood, B.C., to assume the management of the LaRose Mine at Cobalt.

Col. J. H. Conrad, one of the principal owners of the new mining camp near White Horse, Yukon, is visiting New York on business in connection with his Western interests.

Mr. James McEvoy, geologist and chief engineer for the Crow's Nest Pass Coal Co., has had a severe attack of pneumonia, from which, however, he is now recovering. He hopes to resume his duties shortly.

Mr. W. C. Thomas has been appointed resident general manager for the Dominion Copper Co. at Phoenix, B.C., in succession to Mr. T. R. Drummond. Mr. George Williams has received the appointment of the company's smelter superintendent.

Mr. Bernard McDonald, well known in Canada, has opened an office at 40 Wall St., New York.

Mr. R. R. Hedley, after visiting the Cobalt and Sudbury districts, returned on May 12th to British Columbia, where he will commence at once the special work for which he has been retained by the Federal Department of Mines.

Mr. S. S. Fowler, of Nelson, B.C., general manager of the Canadian Metals Co., is visiting New York.

Mr. Bruce R. Warden, of the C. P. R. Mining and Metallurgical Department, Bankhead, Alta., has been retained to superintend the installation of machinery at the Nicola Coal and Coke Co.'s Middleboro Colliery, at Coulee, B.C.

Mr. Paul Johnson, for many years identified with western metallurgical works as manager, respectively, of the Hall, Greenwood, and recently of the Hadley Smelter, is on his way to Europe, where he will probably settle.

Mr. W. H. Aldridge, general manager of the Consolidated Mining and Smelting Co. of Canada, spent some days in business in Montreal and Toronto during the past week. Mr. Aldridge expressed great satisfaction that the coal strike in the West had been settled, and is inclined to the opinion that there will be no further trouble of this nature for some time, at least, so far as the coal mines are concerned. The metal miners, however, are now demanding a general increase of wages of fifty cents a day, at a minimum wage of four dollars a day for miners and three dollars and a half for muckers, which in view of existing conditions is regarded as exorbitant. As a result of the recent coal strike, the Boundary smelters closed down, and it is not expected that operations will be resumed until June.

Mr. H. Harris, recently superintendent of the Hall smelter, has been appointed superintendent of the smelting works at Hadley, Prince of Wales Island, Alaska, under Mr. Thos. Kiddie.

Mr. J. C. Houston has accepted the post of superintendent of the Right of Way Mine at Cobalt.

Mr. W. R. Brock, Professor in Geology, Kingston School of Mining, will make a report on the Larder Lake gold area for the Ontario Bureau of Mines during the coming summer. Mr. Brock is especially well fitted for this work, his reports on the gold and copper deposits of British Columbia having attracted much attention during recent years. The Government is to be congratulated on securing the services of so competent a man to make the report on this district, which is now attracting so much attention.

Mr. R. E. Hore, who was one of the assistants of the Provincial Geologist of Ontario during the last year, is now in charge of a prospecting party for Mr. D. O'Connor, of Temagami.

Mr. M. B. Baker, Lecturer in Geology at Kingston School of Mining, is spending the summer at the University of Heidelberg, and is working under the well-known Professors Rosenbusch, Goldschmidt and Salamon.

Mr. J. Walter Wells, at one time Provincial Assayer, is in charge of an exploring party in the Temagami-Montreal River section.

The paper on "Grogs" read at the recent meeting of the Ontario Clay Workers in Toronto, by Mr. M. B. Baker, Lecturer in Geology of the School of Mining, Kingston, has appeared in half a dozen papers all over the world, and is said to have been translated into French and Swedish. This affords further evidence of the good work which Mr. Baker has been doing in connection with the clay-working industry.

Mr. Eugene Coste has returned to Toronto from Colombia, South America, where he went early in March to examine certain oil fields.

Mr. G. R. Mickle, Professor of Mining, School of Practical Science, Toronto, has accepted the position of Assessor for the Ontario Mines Department. The duties devolving upon the Assessor will be of an extremely exacting nature. Mr. Mickle should fill the requirements of the situation very satisfactorily.

Mr. H. E. T. Haultain has been appointed general manager of the Canada Corundum Company, Craigmont, Ont.

Mr. W. A. Carlyle, for the past seven years general manager of the Rio Tinto Copper Mines, Spain, has resigned that position to take up consulting work in London, where his temporary address is Bank of Montreal, Threadneedle St.

Mr. A. A. Hassan, mining geologist and consulting engineer, is in the Montreal River district, studying geological conditions. He will also visit Larder Lake and Lady Evelyn Lake, and will examine the Nipissing and several other Cobalt properties. Subsequently Mr. Hassan will proceed west to examine several mines near Nevada City, California, and from there into the High Sierras to watch the development of the Bishop Creek Gold Company's Mines, near Bishop, California.

Dr. J. Mackintosh Bell, Director of the New Zealand Geological Survey, will visit Canada in July. Dr. Bell expects to spend some weeks in Ontario.

Mr. O. N. Scott, consulting mining engineer, left Toronto on May 14th to inspect mineral claims in the Sudbury district.

At the Great Cobar Copper Mine, New South Wales, of which Mr. J. D. Kendall is consulting engineer, arrangements are being made for doubling the present output by installing additional plant having a nominal capacity of 1,000 tons a day, at a cost of £160,000.

The annual meeting of the Royal Society of Canada was held last week at Ottawa. Feeling reference was made to the recent death of the late Dr. W. H. Drummond, and a poem to his memory by Mr. William Campbell was read, of which the two closing verses ran:

"But here on the shores behind him,
Where the manly heart is still,
He leaves a vacant place in our song
No other singer can fill.

He who gave us, so joyous,
Amid all our doubtings and fears,
Those heart-deep songs of a people,
Brimming with laughter and tears."

STATISTICS AND RETURNS

Cobalt ore shipments for the week ending May 11, 1907:

	Pounds.
May 6, Coniagas Mine to Perth Amboy	62,000
May 10, Coniagas Mine to Perth Amboy	62,000
May 8, Right of Way Mine to Newark, N.J.	1,400
May 8, Trethewey Mine to New York	43,360
May 8, O'Brien Mine to Perth Amboy	65,210
	233,970

Cobalt ore shipments for the week ending May 18, 1907:

	Pounds.
May 13, O'Brien Mine to Perth Amboy, N.J.	88,100
May 17, O'Brien Mine to Perth Amboy, N.J.	82,170
May 14, Coniagas Mine to Copper Cliff	41,760
May 16, Coniagas Mine to Perth Amboy	63,300
May 18, Coniagas Mine to Perth Amboy	64,560
May 15, Temiskaming Mining Co. Ltd. to Bergen Junction, N.J.	54,500
	396,390

Following are copper returns for the week ending May 11 for the British Columbia districts as specified:

BOUNDARY SHIPMENTS.

Mine.	Week.	Year.
Mother Lode	3,840	69,787
Emma	153	3,246
Providence	38	568
Oro Denoro	82	1,338
Other mines		291,832
Total	4,113	366,771

ROSSLAND SHIPMENTS.

Centre Star	1,469	30,265
Le Roi	1,708	46,662
Le Roi, No. 2	374	7,937
Le Roi, No. 2, milled	1,050	3,370
White Bear	123	775
Other mines		1,500
Total	4,724	90,509

KOOTENAY-SLOCAN SHIPMENTS.

Sullivan	600	11,400
La Plata, milled	425	8,075
Second Relief, milled	145	2,765
Queen, milled	185	3,515
Eva, milled	230	230
Hunter V.	80	1,813
Queen Victoria	159	1,245
St. Eugene	133	5,141
La Plata	58	1,235
Arlington, Slocan	47	283
Vancouver	60	201
Other mines		6,373
Total	2,122	42,276

The total shipments from the mines in the above districts for the past week were 10,959 tons and for the year to date 499,556 tons.

Shipments from the Cumberland Railway and Coal Company collieries, Springhill, N.S., amounted to 29,872 tons for the month of April.

The following figures, indicating German consumption of foreign copper for the period January to March, 1907, inclusive, have been supplied by L. Vogelstein & Co., 100 Broadway, N.Y.

	Tons.
Imports of copper	26,506
Exports of copper	2,113
Consumption	24,393

as against 28,700 tons for the same period in 1906. Of this amount 7,007 tons were imported from the United States.

COMPANY NOTES

The nineteenth ordinary general meeting of the Tilt Cove Copper Company (Newfoundland) was held on May 6th at their offices, 9 Queen St. Place, London, E.C. The Committee of Management reported to the shareholders the balance sheet and profit and loss account for the year ending December 1st, 1906. The profit and loss account shows a credit balance of £47,508 10s. 6d. The Cape Copper Company's Tilt Cove establishment audited accounts for the year ending 31st December, 1906, show a net profit of £99,340 7s. 10d. This balance has been divided equally between the Cape Copper Company and the Tilt Cove Copper Company, as provided for by agreement. Out of the available profit of £50,985 3s. 8d. the committee recommended a final dividend of 4s. 6d. per share, making a total distribution for the year of 10s. 6d. per share, or 26¼ per cent., leaving the sum of £3,510 9s. 11d. to be carried forward to the next account.

The Devil's Rock Silver Mining Company, Limited, has secured the right of increasing its capital stock from $500,000 to $850,000, by the issue of three hundred and fifty thousand shares of new stock at $1 each.

At a meeting held on May 9th the directors of the Crow's Nest Pass Coal Company decided to recommend to a special meeting of shareholders on May 21st the issue of $500,000 of new stock. The growing necessities of the West demands an expansion of the company's facilities.

By supplementary letters patent dated April 16, 1907, the powers of the LaRose Mining Company, Limited, have been extended to enable them to carry on in all their branches the operations of a mining, milling, reduction and development company generally in any part of the Province of Ontario.

The International Steel Company of Canada, Limited, has increased the number of its directors from three to seven.

Messrs. Peacock Bros., of Montreal, have received an order from the Nova Scotia Steel Co. for an immense air compressor for their Newfoundland Mines. The compressor is to have a capacity of 3,000 cubic feet of free air per minute, and is to be delivered by the end of August.

Cobalt, Silver Queen, Limited (Ontario).—The report of this company for the year ending March 31st, 1907, states that development work was restricted by the non-arrival of machinery, but this, notwithstanding 442,141 lbs. of ore were shipped, and 109,273 lbs. remain on hand. The workings, including the sinking of a shaft to a depth of 145 feet and laterals driven east and west, aggregated nine hundred feet, and ore to the value of $700,000 was blocked out. During the year $120,000 was distributed to shareholders. The ore continues to maintain its width and value. The balance sheet shows receipts of $157,915 from the sale of ore and disbursements on account of construction, machinery, etc., of $17,859; and of mining, labor and supplies, $34,191.

Dominion Copper Co. (British Columbia).—This company has arranged to retire a part of its outstanding issue of 6 per cent. bonds to the value of $175,000. It is stated that the company has now an available cash balance on hand of $700,000, and it is expected that a first dividend at the rate of 10 per cent. per annum will be declared shortly.

Cobalt Townsite, Silver Mining (Ontario).—The following cable, under date May 1st, has been received at the London office: "Have made new discovery in crosscut to the north, the width of vein is 3 in. Assay results very satisfactory, 3,650 ozs. of silver per ton of 2,000 lbs. We have shipped to-day third carload 20 tons. May 3: third carload estimated value, $5,000. This is net after paying all costs (office note). This cable refers to the third shipment, viz., 20 tons of ore on May 1."

Crow's Nest Pass Coal (British Columbia).—The annual report of this company has been issued to shareholders, and contains the following information:

"The aggregate of the profit and loss account is $703,592. From this amount the directors have paid four quarterly dividends of 2½ per cent. each, making 10 per cent. for the year, and amounting in all to $350,000, and have carried forward to 1907 $353,592 to the credit of profit and loss account. The coal mined this year amounts to 806,901 tons, as against 831,249 tons mined in 1905. The production of coke amounted to 213,295 tons, as against 257,702 tons in 1905. The difference in production is due to the strike, which commenced on the 22nd of September and lasted for practically two months. Had the strike not occurred, and the average been maintained, the output would have reached the million-ton mark for the year."

Following is the income account, as compared with the two previous years:

	1906.	1905.	1904.
Balance previous year	$351,801	$203,320	$1,870,813
Net profits for year	351,791	497,899	406,049
Premium on new stock	.....	35,400	38,865
Total	$703,592	$736,619	$2,315,727
Dividends	350,000	349,418	348,427
Balance	$353,592	$387,201	$1,967,300
Reserve fund	.....	35,400	1,764,000
P. & L. surplus	$353,592	$351,801	$203,300

In an interview at Winnipeg, Sir William Mulock, referring to the recent strike at the Fernie collieries, pointed out that the

public had suffered great inconvenience in the past from labor disturbances in the coal areas, and in view thereof he thought some effort should be made to avoid like inconvenience in the future. This, he thought, might be done, by coal consumers in storing a reasonable supply in advance of actual requirements. For various reasons it is custom of the mines in the Crow's Nest region to mine coal only in sufficient quantities to fill the cars awaiting loading. If the supply of cars is restricted, mining ceases or is reduced; while, if at other times there is a surplus of cars, the mines are not always in position to take advantage of the increased facilities. In short, a hand-to-mouth policy has been pursued, with the result that any interruption in the supply has been immediately felt by the public.

NEW COMPANIES

The Sturgeon River Coal Company, Limited, Edmonton, Alberta.

The Galbraith Coal Company, Limited, non-personal liability, Lundbreck, Alberta.

The Southern Alberta Coal and Fire Clay Company, Limited, non-personal liability, Taber, Alberta.

The Bornite Company, Limited, capital $20,000, divided into twenty shares of $1,000 each, Victoria, B.C.

The Crown Coal and Coke Company, Limited, capital $2,000,000, divided into two million shares of $1 each. Head office, Spokane, U.S.A.

The Brown Alaska Company, Limited, capital $1,000,000, divided into one million shares of $1 each. Head office, Seattle, U.S.A.

The Cobbler Sexton Mining Company, Limited, capital $1,000,000, divided into one million shares of $1 each. Head office, Woodstock, N.B.

The Mississippi Cobalt Silver Mining Company, Limited, capital $1,000,000, divided into one million shares of $1 each. Head office, Carleton Place, Ont.

The Giant California Mining Company, Limited, non-personal liability, capital $5,000,000, divided into fifty thousand shares of one hundred dollars each, Victoria, B.C.

The British Columbia Gypsum and Plaster Company, Limited, capital $100,000, divided into one thousand shares of one hundred dollars each. One of the objects of this company is to obtain mineral claims situate on the west side of Thompson River, opposite Spatsum, B.C.

The following company to operate in Canada was recently registered in London: Western Canada Investment Company, Limited; capital, £100,000, in £1 shares. Objects: To carry on an investment, financial, and agency business in Canada or elsewhere; to seek and secure openings for the employment of capital in any part of the world; to search for, prospect, examine, and explore mines and ground supposed to contain minerals or precious stones; to acquire, hold, dispose of, and deal with gold, silver, copper, lead, tin, quicksilver, iron, coal and other mines, mining, water, timber and other rights, etc. No initial public issue. The first directors (to number not less than three nor more than five) are: C. Bulkeley-Johnson, of Gladwood, Melrose, N.B.; R. D. Fordyce, Brucklay Castle, Aberdeenshire; and A. Partner, The Briars, Tolworth, Surbiton. Qualification, 500 shares. Remuneration as fixed by the company. Registered office: 24 Coleman St., E.C.

METAL, ORE AND MINERAL MARKET

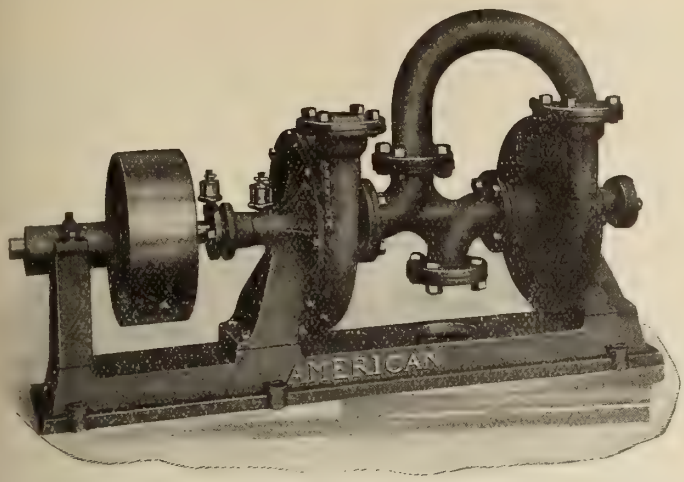
Aluminium—No. 1 ingots, 41 cents per lb.
Antimony—22½ to 23 cents per lb.
Arsenic, white—7⅞ cents per lb.
Barytes, crude—$11.50 to $14.50 per short ton.
Bismuth—$1.40 to $1.50 per lb.
Cadmium—$1.40 per lb.
Carbon, for drills—$78 to $85 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt, Ont., unrefined—35 to 90 cents per lb.
Corundum—7 to 10 cents per lb.
Feldspar, ground—$9.75 per short ton.
Fluorspar, lump—$10 per short ton.
Graphite, domestic—$50 to $150 per short ton.
Gypsum, lump—$4.50 per long ton.
Infusorial earth, ground—$15 to $30 per ton.
Lead—6 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$80 per short ton.
Mica, scrap—$15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 95 per cent. pure—$4.50 to $5 per unit.
Nickel—45 cents per lb.
Platinum, ordinary metal—$31 per ounce.
Pyrite, 38 per cent. to 45 per cent. sulphur, lump—10¼ to 11¼ cents per unit.
Quicksilver—$41 to $42 for 75-lb. flask.
Talc—$16 to $19 per ton.
Tungsten, pure metal—$1.25 per lb.
Tungsten ore, 60 per cent. pure—$400 per ton.
Tin—44 to 45 cents per lb.
Zinc sheets—$8.60 per 100 lbs.

MARKET NOTES.

Northern pig iron, No. 2 foundry, ranges up to $27 for quick deliveries.

Copper is still quiescent. Lake copper, 25 to 25½ cents per lb.; electrolytic, 24 to 24¼ cents per lb. The London market is less active; Standard, £102 3s. for spot.

Tin—New York, 44 to 45 cents per lb.; London, £189 per long ton for spot.



Lead—New York, 6 cents per lb.; London, £19 17s. per long ton.

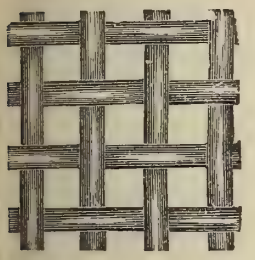
Silver has advanced fractionally. New York, 65⅝ cents per ounce; London, 30 9-16 d. Mexican dollars, 50½ cents.

Spelter has declined—New York, 6.35 to 6.45 cents per lb.; London, £25, 17s. 6d. per long ton.

ELECTRIC STEEL

In a paper on the induction furnace, by Mr. Hermann Roechling, read before the Verein Deutscher Eisenhüttenleute recently, he refers to the experiments made at Voelklingen with two furnaces, one containing 50 to 60 kg. (110 lbs. to 130 lbs.), and the other 300 k.g. (660 lbs.). Alternating current of 50 periods was used. With the smaller furnace the power factor was very unsatisfactory; the figure given is 0.95. For the larger furnace no figure is given; it is said that the power factor is poor, but it is hoped to improve matters. To melt pig iron and heat it to about 1,200 degrees C. (about 2,200 degrees Fahr.), about 385 kw. hours per ton was required in the 300 kg. furnace. To complete a charge of scrap, about 600 kw. hours are required. The cost of this amount of electrical energy would be too high to render the process economical, and this is the reason why molten metal (instead of cold scrap, etc.) should be charged into the furnace, since in this way a considerable amount of electrical energy may be saved. By starting with molten basic or open-hearth steel, it is possible to refine the bath with a low expenditure of energy. For instance, at Voelklingen it has been found repeatedly possible to completely deoxidize ordinary molten basic steel and to remove sulphur and phosphorus down to mere traces and to recarburize the metal to 1 or 1½ per cent. of carbon and to finish the charge, with the total expenditure of 150 to 200 kw. hours per ton. With this expenditure it was possible to produce the finest sorts of crucible steel. If it is considered that this is possible with a furnace which contains only 300 kg. (660 lbs.), it is evident that with a larger furnace much better results may be obtained.

The latest, most improved and lightest running



CENTRIFUGAL PUMPS

Manufactured.

Will save you at least 25% power over any other make of pump, or you can get 25% more water with them than with any other pump using same power.

FOR MINE WORK

Westinghouse Induction Motor Driving Byron-Jackson 5-Stage Centrifugal Pump.

Common Sense

tells you that a common motor can only give common service. To secure uncommon service a motor of uncommon quality is required.

"Westinghouse Quality"

We make all kinds of motors for all kinds of work.

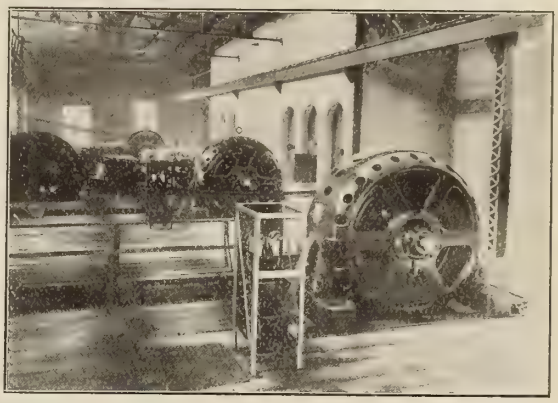
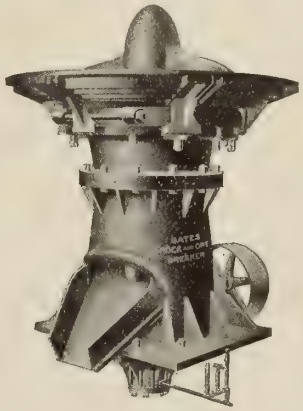
Opposite Queen's Hotel



TORONTO, ONT.

EVERYTHING IN MINING

Purchasers may avoid the delays inevitable in dealing with half-a-dozen companies for different portions of their equipment and obtain better value by purchasing their entire equipment from One Company.



The "Lidgerwood" combined friction drum and brake and reversible link motion hoisting engine is the most economical yet made for mine hoisting.

Three of our 600 h.p. Induction Motors driving blowing engines at the Canadian Copper Co., Copper Cliff. This type of motor is specially adapted for all mining operations.

This is a view of three of our Ingersoll steam drills engaged in rock excavation

Gates "K" Rock and Ore Breaker will break more per horse power than any other ever built.

Air Compressors	Frue Vanners	Lixiviation Plants	Rock Drills
Boiling Tanks	Gold and Silver Mills	Mining Cages	Skips
Chilian Mills	Gold Dredging Machinery	Mining Cars	Smelting Machinery
Chlorination Plants	Gyratory Breakers	Mine Ventilating Machinery	Stamps, Gravity
Concentrating Plants	Hancock Gigs	Ore Buckets	Stamps, Steam
Copper Converting Plants	Hoisting Machinery	Ore Cars	Stamps, Atmospheric
Crushing Plants	Horse Whims	Ore Feeders	Stamp Shoes, and Dies
Cyanide Plants	Huntington Mills	Overstrom Concentrators	Tramways
Electric Generators	Jaw Crushers	Prospecting Mills	Tube Mills, Wet and Dry
Electric Motors	Lead Refining Plants	Roasting Furnaces	Turbines, Water Wheel
			Turbines, Steam
